The phaſes of Venus were firſt diſcovered in 1611 by Galileo, who ſent an account of the diſcovery to William de Medici, in order to have it communicated to Kepler. He tranſmitted it in this cypher, "Hæc immaturæ a me fruſtra leguntur, o.y;" which, duly arranged, is "Cynthiæ figuras æmulatur mater amorum," *i. e.* Venus emulates the phaſes of the moon. Afterwards he wrote a letter to him, giving an account of the diſcovery, and explaining the cypher. In 1666, M. Caſſini, at a time when Venus was dichotomized, diſcovered a bright ſpot upon it at the ſtraight edge, like ſome of the bright ſpots upon the moon's ſurface; and by obſerving its motion, which was upon the edge, he found the ſidereal time of rotation to be $23^h\ 16'$. In the year 1726, Bianchini made ſome obſervations upon the ſpots of Venus, and aſſerted that the time of rotation was $24\frac{1}{3}$ days; that the north pole anſwered to the 20th degree of Aquarius, and was elevated from 15° to 20° above its orbit; and that the axis continued parallel to itſelf. M. Caſſini, the ſon, vindicated his father's obſervations, and took occaſion, from the interruption of Bianchini's obſervations, to ſhew that ſhe might eaſily miſtake different ſpots for the ſame; and he concludes, that if we ſuppoſe the time of rotation to be $23^h\ 20'$, it agrees equally with their obſervations; but if we take it to be $24\frac{1}{3}$ days, it will not at all agree with his father's obſervations. M. Schroeter has endeavoured to ſhew that Venus has an atmoſphere, from obſerving that the illuminated limb, when horned, exceeds a ſemicircle; and this he ſuppoſes to ariſe from the refraction of the ſun's rays through the atmoſphere of Venus at the cuſps, by which they appear prolonged. The cuſps appeared ſometimes to run 15° 19′ into the dark hemiſphere; from which he computes, that the height of the atmoſphere, for refracting ſuch a quantity of light, muſt be 15,156 Paris feet; but this muſt depend on the nature and denſity of the atmoſphere, of which we are ignorant. (See Phil. Tranſ. for 1792.) He makes the time of rotation to be $23^h\ 21'$; and concludes, from his obſervations, that there are conſiderable mountains upon this planet.

He found that, like thoſe of Mercury and of the moon, thoſe of the ſouthern hemiſphere were the higheſt; their perpendicular heights being nearly as the diameters of their reſpective planets. M. Schroeter meaſured the height of four mountains in Venus, and obtained the following reſults; *viz.*

	Toiſes.	Miles.
1ſt Higheſt -	18900	22.05
2d Higheſt -	15750	18.97
3d Higheſt -	9500	11.44
4th Higheſt -	9000	10.84

This planet has generally been conſidered as about 220 miles leſs in diameter than the earth; but from the meaſurements of Dr. Herſchel, whoſe accuracy cannot be queſtioned, it is inferred that when reduced to the mean diſtance of the earth, her apparent mean diameter is $18''.79$, that of the earth being $17''.2$, that is, 8648 Engliſh miles, the diameter of the earth being 7912. Phil. Tranſ. for 1795. See VENUS.

M. de la Hire, in 1700, with a teleſcope of ſixteen feet, diſcovered mountains in Venus, larger than thoſe of the moon.

Dr. Herſchel agrees with M. Schroeter in ſuppoſing that Venus has a conſiderable atmoſphere; but he has not made any obſervations by which he can determine either the time of rotation, or the poſition of the axis. See Phil. Tranſ. for 1793.

Gaſſendus firſt, and after him others, have obſerved Mercury on the face of the ſun, acroſs which he appeared to paſs like a black round ſpot. Horrox, in 1639, alſo obſerved Venus in the ſun, where ſhe made the ſame appearance. Two tranſits have been ſince obſerved, and thoſe of Mercury are more frequent. See PARALLAX and TRANSIT.

Galileo diſcovered the phaſes of Mars; after which ſome Italians, in 1636, had an imperfect view of a ſpot. But in 1666 Dr. Hooke and M. Caſſini diſcovered ſome well defined ſpots, obſerved likewiſe by Campani; and Caſſini determined the time of the rotation to be $24^h\ 40'$. Soon after, M. Maraldi obſerved ſome ſpots, and determined the time of rotation to be $24^h\ 39'$. He alſo obſerved a very bright part near the ſouthern pole, apparently like a polar zone; this, he ſays, has been obſerved for 60 years; it is not of equal brightneſs; more than half of it being brighter than the reſt; and that part which is leaſt bright is ſubject to great changes, and ſometimes diſappears. Something of the ſame kind has been obſerved about the north pole. The rotation is according to the order of the ſigns. Dr. Herſchel makes the time of a ſidereal revolution to be $24^h\ 39'\ 21''.67$, without the probability of a greater error than $2''.34$. He propoſes to find the time of a ſidereal rotation, in order to diſcover, by future obſervations, whether there is any alteration in the time of the revolution of the earth, or of the planets, about their axes; for a change of either would be thus diſcovered. He choſe Mars, becauſe its ſpots are permanent. (See Phil. Tranſ. for 1781.) From farther obſervations upon Mars, which he publiſhed in Phil. Tranſ. for 1784, he makes its axis to be inclined to the ecliptic 59° 42′, and 61° 18′ to its orbit; and the north pole to be directed to 17° 47′ of Piſces upon the ecliptic, and 19° 28′ on its orbit. He makes the ratio of the diameters of Mars to be as 16 to 15. Dr. Maſkelyne has carefully obſerved Mars at the time of oppoſition, but could not perceive any difference in its diameters. Dr. Herſchel obſerves, that Mars has a conſiderable atmoſphere, the denſity of which occaſions the redneſs of its light. La Place has computed the denſity of this planet to be $\frac{3}{4}$ths that of the earth. See MARS.

Jupiter is obſerved to have belts, and alſo ſpots, by which the time of its rotation can be more accurately aſcertained.

tained. Theſe belts were firſt obſerved by two Jeſuits, Zuppi and Bartoli. They were afterwards examined in 1633 by Fontana, Rheita, Riccioli, Grimaldi and Campani. M. Caſſini found the time of rotation to be $9^h\ 56''$, from a remarkable ſpot which he obſerved in 1665. In October, 1691, he obſerved two bright ſpots, almoſt as broad as the belts; and at the end of the month he ſaw two more, and found them to revolve in $9^h\ 51'$; he alſo obſerved ſome other ſpots near Jupiter's equator, which revolved in $9^h\ 50'$; and, in general, he found that the nearer the ſpots were to the equator, the quicker they revolved. It is, therefore, probable, that the ſpots are not upon Jupiter's ſurface, but in its atmoſphere; and for this reaſon alſo, that ſeveral ſpots, which appeared round at firſt, grew oblong by degrees, in a direction parallel to the belts, and divided themſelves into two or three ſpots. M. Maraldi, from a great many obſervations of the ſpot obſerved by Caſſini in 1665, found the time of rotation to be $9^h\ 56'$: and concluded that the ſpots had a dependence upon the contiguous belt, as the ſpot had never appeared without the belt, though the belt had been ſeen without the ſpot. It continued to appear and diſappear, until the year 1694, and was not ſeen any more until the year 1708; hence he concluded, that the ſpot was ſome effuſion from the belt upon a fixed place of Jupiter's body: for it always appeared in the ſame place. Dr. Herſchel found the time of rotation of different ſpots to vary; and that the time of rotation of the ſame ſpots diminiſhed, for the ſpot obſerved in 1788 revolved as follows. From February the 25th to March the 2d, in $9^h\ 55'\ 20''$; from March the 2d to the 14th, in $9^h\ 54'\ 58''$; from April the 7th to the 12th, in $9^h\ 51'\ 35''$. Alſo, from a ſpot obſerved in 1779, its rotation was, from April the 14th to the 19th, in $9^h\ 51'\ 45''$; from April the 19th to the 23d., in $9^h\ 50'\ 48''$. This, he obſerves, is agreeable to the theory of equinoctial winds, as it may be ſome time before the ſpot can acquire the velocity of the wind; and if Jupiter's ſpots ſhould be obſerved in different parts of its revolution to be accelerated and retarded, it would amount almoſt to a demonſtration of its monſoons, and their periodical changes. M. Schroeter makes the time of rotation $9^h\ 55'\ 36''.6$; and he obſerved the ſame variations with thoſe of Dr. Herſchel. The rotation is according to the order of the ſigns. This planet is obſerved to be flat at its poles. Dr. Pound meaſured the polar and equatorial diameters, and found them to be as 12 to 13. Mr. Short made them as 13 to 14. Dr. Bradley made them as 12.5 to 13.5. Sir Iſaac Newton makes the ratio $9\frac{1}{3}$ to $10\frac{1}{2}$ by theory. The belts of Jupiter are generally parallel to its equator, which is very nearly parallel to the ecliptic: they are ſubject to great variations, in reſpect both to their number and figure: ſometimes eight have been ſeen at once, and at other times only one: ſometimes they continue for three months without any variation, and ſometimes a new belt has been formed in an hour or two. From their being ſubject to ſuch changes, it is very probable that they do not adhere to the body of Jupiter, but exiſt in its atmoſphere. Others, however, imagine that they are of a more permanent nature, and that they indicate great phyſical revolutions, which are perpetually agitating and changing the ſurface of the planet. It is ſuggeſted by Dr. Brewſter (Ferguſon's Aſtronomy, vol. ii.) that the ſpot firſt obſerved by Caſſini, already mentioned, could not poſſibly be occaſioned by any atmoſpherical variations; and that its diſappearance for five years, between 1708 and 1713, affords a preſumptive, though not a deciſive argument, that it aroſe from ſome changes in the body of the planet. He inclines to think, that from the frequent appearance of this ſpot, it is permanent upon the body of Jupiter, and that its diſappearance is owing to the interpoſition of clouds in the atmoſphere of the planet. He farther intimates, that the clouds of Jupiter, partaking of the great velocity of its diurnal motion, are formed into ſtrata parallel with the equator; that the body of Jupiter reflects leſs light than the clouds; and that the belts are nothing more than the body of the planet ſeen through the parallel interſtices which lie between the different ſtrata of clouds. The permanent ſpot of Caſſini will, of courſe, only be ſeen when it is immediately below one of theſe interſtices, and will therefore always appear as if it accompanied one of the belts. See Jupiter and Satellites.

Saturn was ſuſpected by Caſſini and Fatio, in 1683, to have a revolution about its axis, for they one day ſaw a bright ſtreak, which diſappeared the next, when another came into view near the edge of its diſc: theſe ſtreaks are called "belts." In 1719, when the ring diſappeared, Caſſini ſaw its ſhadow upon the body of the planet, and a belt on each ſide parallel to the ſhadow. When the ring was viſible, he perceived the curvature of the belts was ſuch as agreed with the elevation of the eye above the plane of the ring. He conſidered them as ſimilar to our clouds floating in the air; and having a curvature ſimilar to the exterior circumference of the ring, he concluded that they ought to be nearly at the ſame diſtance from the planet, and that conſequently the atmoſphere of Saturn extended to the ring. Huygens obſerved five belts, which were nearly parallel to the equator. Dr. Herſchel found that the arrangement of the belts always followed the direction of the ring: thus, as the ring opened, the belts began to ſhew an incurvature anſwering to it. And during his obſervations on June the 19th, 20th, and 21ſt, in the year 1780, he ſaw the ſame ſpot in three different ſituations. He conjectured, therefore, that Saturn revolved about an axis perpendicular to the plane of its ring. Another argument in ſupport of this is, that the planet is an oblate ſpheroid, having the diameter in the direction of the ring to the diameter perpendicular to it, as about 11 to 10, according to Dr. Herſchel; the meaſures were taken with a wire micrometer, prefixed to his 20-feet reflector. The truth of his conjecture he has now verified, having determined that Saturn revolves about its axis in $10^h\ 16'\ 0''.44$. (See Phil. Tranſ. for 1794.) La Place had formerly found that the interior ring ought to perform its revolution in ten hours. (Mem. Acad. 1787.) The rotation is according to the order of the ſigns.

In 1789 Dr. Herſchel meaſured the diameter of this planet, and found that the equatorial diameter was $22''.8$, and the polar diameter $20''.6$; which gives the proportion nearly of 10 to 11. But from more recent obſervations, he inferred that the polar is to the equatorial diameter as 32 to 35, or as 11 to 12 nearly. Until the year 1805 Dr. Herſchel had always regarded Saturn as an accurate ſpheroid, but in April of that year he was ſtruck with a very ſingular appearance exhibited by the planet. The flattening at the poles did not ſeem to begin till a very high latitude; ſo that the real figure of the planet reſembled a ſquare, or rather a parallelogram, with the four corners rounded off deeply, but not ſo much as to bring it to a ſpheroid. (See Phil. Tranſ. for 1805.) The following are the proportional dimenſions of Saturn's diſc.

Diameter of the greateſt curvature	36
Equatorial diameter	35
Polar diameter	32
Latitude of the longeſt diameter	$43^\circ\ 20'$

See Ring and Saturn.

The Georgian planet is at ſo great a diſtance, that aſtronomers with their beſt teleſcopes, have not been able to diſcover whether or not it has any revolution about its axis. Since the Sun (ſee Sun), Moon (ſee Moon), Saturn, Jupiter, Mars, the Earth, and Venus, are found to revolve on on their axes, *i. e.* to have a diurnal rotation, we may argue from analogy that Mercury and the Georgian have the ſame; although the proximity of the former to the ſun, and the great diſtance of the latter prevent any ſpots from being obſerved in them, by which that rotation might be demonſtrated.

Moreover, in the year 1609, were firſt obſerved the little ſtars or moons, moving about Jupiter, by Sim. Marius; and in 1610 the ſame were obſerved by Galileo: theſe are now frequently obſerved to diſappear in a clear ſky, when Jupiter happens to be diametrically interpoſed between them and the ſun. Whence it appears that they are void of light, at ſuch time when the ſun's rays, intercepted by Jupiter, cannot be propagated to them in right lines; and hence alſo that, like the moon, they are opaque bodies illuminated by the ſun; and hence again, ſince Jupiter does not illuminate his ſatellites when placed behind him, he himſelf, in that part turned from the ſun, may be argued to be void of light.

When Jupiter's moons are diametrically interpoſed between Jupiter and the ſun, there is ſeen a round ſpot on Jupiter's diſk, which is ſometimes larger than the ſatellite itſelf. Whence it appears, that the ſatellites are opaque bodies, illuminated by the ſun; that they project a ſhadow from the ſun; and that the round ſpots, ſeen in Jupiter, are the ſhadows of the ſatellites.

Whence, alſo, the interſection of that ſhadow being found to be a circle, the ſhadow muſt be conical; and therefore the figure of the ſatellites, at leaſt as to ſenſe, is ſpherical.

The earth being between Jupiter and the ſun; if, at the ſame time, any one of the ſatellites happen to be between Jupiter and the ſun, it is loſt in Jupiter's light; though ſometimes appearing like a black ſpot. This phenomenon has been frequently obſerved by Caſſini and Maraldi who have likewiſe noted very conſiderable alterations in the apparent magnitudes of the ſatellites; for which no reaſon could be given from the diſtance of Jupiter, the ſun, or the earth: *e. gr.* that the fourth, which is uſually ſeen the ſmalleſt, is ſometimes the largeſt; and the third, which is uſually the largeſt, appears ſometimes the ſmalleſt. Hence, as the ſatellites are illuminated by the ſun, even when immerged in Jupiter's light, yet do appear obſcure, there muſt be ſome alteration in their atmoſpheres, to prevent the ſun's rays being equally reflected from every part of their ſurface; which muſt likewiſe be the cauſe why their ſhadow is ſometimes larger than themſelves. See SATELLITES.

Now, to ſum up the evidence reſulting from the preceding detail of obſervations: 1. Since in Venus, Mercury, and Mars, only that part of the diſc illuminated by the ſun, is found to ſhine; and, again, Venus, and Mercury, when between the earth and the ſun, appear like dark ſpots, or maculæ, on the ſun's diſc, it is evident, that Mars, Jupiter, and Mercury, are opaque bodies, illuminated with the borrowed light of the ſun. And the ſame appears of Jupiter, from its being void of light in that part to which the ſhadow of the ſatellites reaches, as well as in that part turned from the ſun; and that his ſatellites are opaque, and reflect the ſun's light, is alſo abundantly ſhewn. Wherefore, ſince Saturn, with his ring and ſatellites, do only yield a faint light, fainter conſiderably than that of the fixed ſtars, though theſe be vaſtly more remote, and than that of the reſt of the planets, it is paſt doubt, that he too, with his attendants, are opaque bodies.

Since the ſun's light is not tranſmitted through Mercury and Venus, when placed againſt him, it is plain they are denſe opaque bodies; which is likewiſe evident in Jupiter, from his hiding the ſatellites in his ſhadow; and therefore, by analogy, the ſame may be concluded of Saturn.

From the variable ſpots in Venus, Mars, and Jupiter, ſome have concluded that thoſe planets have a changeable atmoſphere; which changeable atmoſphere may, by a like argument, be inferred of the ſatellites of Jupiter; and therefore, by ſimilitude, the ſame may be concluded of the other planets.

In like manner, from the mountains obſerved in Venus, the ſame may be ſuppoſed in the other planets.

Since then Saturn, Jupiter, the ſatellites of both, Mars, Venus, and Mercury, are opaque bodies, ſhining with the ſun's borrowed light, and are furniſhed with mountains, and encompaſſed, as ſome have ſuppoſed, with a changeable atmoſphere, they have, of conſequence, waters, ſeas, &c. as well as dry land, and they are bodies, therefore, like the earth. Q. E. D.

And hence nothing hinders but that the planets may alſo be concluded to be inhabited. Huygens, in his Coſmotheoros, argues very plauſibly for the exiſtence of planetary inhabitants, from the ſimilitude of the planets with our earth: thoſe, like this, being opaque, denſe, uneven, round, heavy, illuminated, and warmed by the ſun, having night and day, ſummer and winter, &c.

Wolfius deduces ſomething relating to this purpoſe from arguments of another kind. Thus, *e. gr.* it is ſcarcely to be doubted, that the inhabitants of Jupiter are much larger than thoſe of the earth, and, in effect, of the giant kind. For it is ſhewn in optics, that the pupil of the eye dilates in a ſtrong light, and contracts in a weak one: wherefore, ſince in Jupiter the ſun's meridian light is much feebler than on the earth, on account of Jupiter's greater diſtance from the ſun, the pupil will need to be much more dilatable in the inhabitants of Jupiter than in thoſe of the earth. But the pupil is obſerved to have a conſtant proportion to the ball of the eye, and the eye to the reſt of the body; ſo that in animals, the larger the pupil the larger the eye, and the larger the body.

To aſcertain the ſize of theſe jovial inhabitants, it may be obſerved, that the diſtance of Jupiter from the ſun is to the earth's diſtance from the ſame, as 28 to 5; the intenſity of the ſun's light in Jupiter is to its intenſity on the earth, in a duplicate ratio of 5 to 28; but it is found by experience, that the pupil dilates in a ratio greater than that in which the intenſity of light decreaſes; otherwiſe a body at a great diſtance might be ſeen as clearly as a nearer; the diameter, therefore, of the pupil in its greateſt dilatation, in the earth, is to its diameter in the like ſtate in Jupiter, in a ratio greater than that of the duplicate of 5 to 28. If then we put it as 10 to 28, or as 5 to 14: ſince the ordinary ſtature of the inhabitants of the earth is computed at 5 Engliſh feet 4 inches and $\frac{2}{10}$ths, (which Wolfius tells us was his own height,) the ordinary ſtature of Jupiter's inhabitants will be found about 14 feet $\frac{2}{3}$ds, which is very nearly the ſize of the giant Og, mentioned by Moſes, whoſe iron bed was nine cubits long, and its breadth four. But arguments of this kind being more whimſical than ſolid, are needleſs, in order to juſtify the ſimilarity of the other planets to our earth, and a conjecture, that they are deſtined by the Creator for the ſame purpoſe.

For an account of the relative and real magnitudes, the proportional and actual diſtances, annual and diurnal revolutions, &c. of the planets, both primary and ſecondary, ſee SUN, *Solar* SYSTEM, MOON, SATELLITES, each planet under its proper name, and the references in the ſequel of this article.

The quantities of matter in the Sun, Jupiter, Saturn, and the Earth, as determined by the Newtonian theory of gravity, are to each other as the numbers 1, $\frac{1}{1067}$, $\frac{1}{3021}$, $\frac{1}{169282}$; and their denſities as the numbers 100, $94\frac{1}{2}$, 67, and 400; and their attractive powers at their ſurfaces as the numbers 10,000, 943, 529, 435, reſpectively. For a more correct ſtatement, ſee DENSITY.

For

For the places and motion of the aphelia of the planets, and the method of determining them, see APHELION.

For the diameters of the fun and planets, as feen from the earth, and the diameters of the planets, as feen from the fun, fee DIAMETER.

For the relative mean diftances of the planets from the fun, fee DISTANCE.

The greateft equations of the planets are as follow: Mercury, 23° 40′ 0″; Venus, 0° 47′ 20″; the Earth, 1° 55′ 36″.5; Mars, 10° 40′ 40″; Jupiter, 5° 30′.38″.3; Saturn, 6° 26′ 42″; the Georgian, 5° 27′ 16″. See EQUATION.

The following table exhibits the relation of the denfities, diameters, quantities of matter, and gravity on the furfaces of the fun and planets, refpectively.

Planets.	Denfities.	Diameters.	Quantities of Matter..	Gravity on Surfaces.
Sun	0.25226	109.8	333928	27.7
Mercury	2.5833	0.4	0.16536	1.0333
Venus	1.024	0.9543	0.88993	0.9771
Earth	1	1	1	1
Mars	0.6563	0.5109	0.08752	0.3355
Jupiter	0.20093	11.59	312.101	2.3287
Saturn	0.10349	9.812	97.762	1.0154
Georgian	0.21805	4.258	16.837	0.9285
Moon	0.6149	0.2727	0.01245	0.1677

The intenfities of light and heat which the planets receive from the fun, vary inverfely as the fquares of their diftances from the fun: and the apparent diameter of a body is inverfely as its diftance; and therefore affuming the mean diameter of the fun = 32′, we fhall have his apparent diameter at the feveral planets as follows.

The following table exhibits the relative intenfities of light and heat at the different planets, and the apparent diameter of the Sun feen from them.

Planets.	Intenfities of Light and Heat.	Apparent Diameter of the Sun.
Mercury	6.25	80′
Venus	2.04	45.7
Earth	1	32
Mars	0.44375	21.33
Jupiter	0.036875	6.15
Saturn	0.01106	3.37
Georgian	0.00276	1.64

The orbits of the planets are all ellipfes; one of whofe foci is in the fun. This Kepler firft found from Tycho's obfervations; before him, all aftronomers took the planetary orbits for excentric circles. The manner in which he proceeded was as follows.

Let S (*Plate* XIX. *Aftronomy*, *fig.* 3.) be the fun, M Mars, D, E, two places of the earth when Mars is in the fame point M of its orbit. When the earth was at D, he obferved the difference between the longitudes of the fun and Mars, or the angle M D S; in like manner, he obferved the angle M E S. Now the places D, E, of the earth in its orbit being known, the diftances D S, E S, and the angle D S E, will be known; hence, in the triangle D S E, we know D S, S E, and the angle D S E, to find D E, and the angles S D E, S E D; hence we know the angles M D E, M E D, and D E, to find M D; and laftly, in the triangle M D S, we know M D, D S, and the angle M D S, to find M S, the diftance of Mars from the fun. He alfo found the angle M S D, the difference of the heliocentric longitudes of Mars and the earth. By this method, Kepler, from obfervations made on Mars when in aphelion and perihelion (for he had determined the pofition of the line of the apfides, by a method independent of the form of the orbit), determined the former diftance from the fun to be 166780, and the latter 138500, the mean diftance of the earth from the fun being 100000; hence, the mean diftance of Mars was 152640, and the excentricity of its orbit 14140. He then determined, in like manner, three other diftances, and found them to be 147750, 163100, 166255. He next calculated the fame three diftances, upon fuppofition that the orbit was a circle, and found them to be 148539, 163883, 166605; the errors therefore of the circular hypothefis were 789, 783, 350. But he had too good an opinion of Tycho's obfervations, (upon which he founded all thefe calculations,) to fuppofe that thefe differences might arife from their inaccuracy; and as the diftance between the aphelion and perihelion was too great, upon fuppofition that the orbit was a circle, he knew that the form of the orbit muft be an oval: "Itaque planè hoc eft: Orbita planetæ non eft circulus, fed ingrediens ad latera utraque paulatim, iterumque ad circuli amplitudinem in perigæo exiens, cujufmodi figuram itineris ovalem appellitant," p. 213. And as, of all ovals, the ellipfe appeared to be the moft fimple, he firft fuppofed the orbit to be an ellipfe, and placed the fun in one of the foci; and upon calculating the above obferved diftances, he found they agreed together. He did the fame for other points of the orbit, and found that they all agreed: and thus he pronounced the orbit of Mars to be an ellipfe, having the fun in one of its foci. Having determined this for the orbit of Mars, he conjectured the fame to be true for all the other planets, and upon trial he found it to be fo. Hence, he concluded, "that the fix primary planets revolve about the fun in ellipfes, having the fun in one of the foci."

The relative mean diftances of the planets from the fun are as follow: Mercury, 38710; Venus, 72333; Earth, 100000; Mars, 152369; Jupiter, 520279; Saturn, 954072; Georgian, 1918352.

Having thus difcovered the relative mean diftances of the planets from the fun, and knowing their periodic times, he next endeavoured to find if there was any relation between them, having had a ftrong paffion for finding analogies in nature. On March 8, 1618, he began to compare the powers of thefe quantities, and at that time he took the fquares of the periodic times, and compared them with the cubes of the mean diftances, but, from fome error in the calculation, they did not agree. But on May 15, having made the laft calculations

calculations again, he discovered his error, and found an exact agreement between them. Thus he discovered that famous law, "That the squares of the periodic times of all the planets are as the cubes of their mean distances from the sun." Sir I. Newton afterwards proved that this is a necessary consequence of the motion of a body in an ellipse, revolving about the focus. Prin. Phil. lib. i. sec. 2. pr. 15.

Kepler also discovered, from observation, that the velocities of the planets, when in their apsides, are inversely as their distances from the sun; whence it followed, that they describe in these points equal areas about the sun in equal times. And although he could not prove, from observation, that the same was true in every point of the orbit, yet he had no doubt but that it was so. He therefore applied this principle to find the equation of the orbit, and finding that his calculations agreed with observations, he concluded that it was true in general, "That the planets describe about the sun equal areas in equal times." This discovery was, perhaps, the foundation of the "Principia," as it might probably suggest to sir I. Newton the idea, that the proposition was true in general, which he afterwards proved it to be. These important discoveries are the foundation of all astronomy. Vince's Elem. of Astronomy.

The planes of the planetary orbits do all intersect in the sun; and the line in which the plane of each orbit cuts that of the earth, is called the *line of the nodes;* and the two points in which the orbits themselves touch that plane, *the nodes*. For the longitude of the nodes of the planets, see NODE.

The motion of the nodes is found by comparing their places at two different times; whence that of Mercury in 100 years is found to be $1^\circ\ 12'\ 10''$; that of Venus, $0^\circ\ 51'\ 40''$; that of Mars, $0^\circ\ 46'\ 40''$; that of Jupiter, $0^\circ\ 59'\ 30''$; that of Saturn, $0^\circ\ 55'\ 30''$. This motion is in respect to the equinox. The Georgian planet has not been discovered long enough to admit of determining the motion of its nodes by observation. M. de la Grange has found the annual motion to be $12''.5$ by theory; but if we take the density of Venus according to M. de la Lande, it will be $20''\ 40'''$, which he uses in his table.

The distance between the centre of the sun and the centre of each object, is called the *excentricity of the planet*. For the excentricities of the planets, see EXCENTRICITY.

The angle at which each plane cuts that of the ecliptic, is called the *inclination of the plane*.

The inclinations of the orbits of the planets are as follow: that of Mercury, $7^\circ\ 0'\ 0''$; that of Venus, $3^\circ\ 23'\ 35''$; that of Mars, $1^\circ\ 51'\ 0''$; that of Jupiter, $1^\circ\ 18'\ 56''$; that of Saturn, $2^\circ\ 29'\ 50''$; and that of the Georgian, $46'\ 20''$. (See NODE.) For the elements of the orbits of Ceres, Pallas, Juno, and Vesta; see the preceding part of this article. See also *Planetary* NUMBERS.

PLANETS, *Motion of the.* That the planets do all revolve round the sun as their centre, and not round the earth, is evident from a thousand phenomena. 1. The orbit in which Venus, *e. gr.* moves, does certainly encompass the sun; and therefore, in describing that orbit, the planet must turn round the sun.

That her orbit includes the sun, appears hence, that she is sometimes above the sun, sometimes below it, sometimes beyond it, and sometimes on this side; all which are evident from the circumstances of her phases.

That she does not move round the earth, is no less apparent, from her being ever observed in the same quarter with the sun, never receding from him above 48°. She never, therefore, comes to be in opposition to the sun; no, not to be in a quartile aspect, or to have a quarter of the heavens between them; both which, like the earth, she must frequently have, did she attend and move round the earth.

2. That Mercury revolves round the sun, appears in like manner from his phases, which resemble those of Venus and the moon; and from its neighbourhood to the sun, from whom Mercury never recedes so far as Venus does.

3. That the orbit of Mars includes the sun, is evident from that planet's being found both in conjunction and opposition with the sun; and in both cases shining with a full face. Indeed, from the same circumstances it appears, that the orbit of Mars encompasses the earth; but then it follows, likewise, from Mars's diameter appearing seven times as big when in opposition as when in conjunction, that he is seven times nearer the earth in the former than in the latter position. The earth, therefore, is far from being the centre of Mars's motion; but Mars is ever nearly at the same distance from the sun. Again, Mars viewed from the earth moves very irregularly; is sometimes seen to proceed slower, sometimes faster; sometimes he stands still, and sometimes he goes backward, (the reason of which see under the article OPTICAL *Inequality*); but viewed from the sun, he will ever appear to move with the same constant uniform tenor; whence it is evident he respects the sun, not the earth, as the centre of his motion.

4. The same appearances whence Mars is shewn to revolve round the sun as a centre, are likewise observed in Jupiter and Saturn; whence the same conclusion may be made of them.

Lastly, that the earth revolves round the sun, as a centre, is evident from her place, which we have observed to be between the orbits of Mars and Venus; and from the phenomena of the superior planets viewed from it. If the earth stood still, we should never see those planets either stationary or retrograde; the earth therefore moves, but it is still found between the orbits of Mars and Venus, which encompass the sun; therefore the earth also encompasses the sun.

To this astronomical demonstration may be added a physical demonstration of the earth's motion from sir Isaac Newton. It appears from abundant observation, that either the earth turns round the sun, or the sun round the earth, so as to describe equal areas in equal times; but he demonstrates, that bodies revolving about one another according to such law, do of necessity gravitate towards each other. Whence, if the sun gravitate to the earth, action and re-action being still equal, the earth will likewise gravitate towards the sun. But he proves, farther, that two bodies gravitating towards each other, without directly approaching one another in right lines, must both of them turn round the common centre of gravity of both. The sun and earth, therefore, do both revolve round one common centre; but the earth being but a point in comparison with the sun, the common centre of gravity of the two will be within the sun's body, and not far from its centre. The earth, therefore, revolves round a point within the body of the sun, and therefore round the sun. See the arguments for the earth's motion under EARTH.

To account for the motion of the planets about the sun, there needs nothing but to suppose an uniform projectile motion, in straight lines, at first given them; and a power of attraction or gravitation, such as we observe in all the great bodies in our system. For a body A (*Plate* XIX. *Astronomy*, *fig.* 4.) proceeding uniformly along the line A B, will, by the intervention of the attracting body C, be every moment diverted out of its rectilinear, and bent into a curvilinear path, according to the laws of central forces.

If, then, the projectile motion be perpendicular to a line, C A, drawn from the attracting body C, and its velocity be so proportioned to the force of attraction of A, as that the

the centripetal and centrifugal forces are equal, *i. e.* that the conatus to fall to the central body C, in a right line, A C; and that to proceed in the direction of the tangent, A B, balance each other; the body will revolve in a circular orbit, A, β, γ, δ, &c.

It is not improbable, that at the beginning this was the ſtate of things; and that the velocities impreſſed on the ſeveral planets were ſo combined with their reſpective maſſes and diſtances from the ſun at which they were to roll, as that their momenta ſhould counterbalance the ſun's attractive force, and be preciſely counterbalanced thereby; whence the primitive orbits muſt have been perfect circles, from which they do not even now deviate very far. See EXCENTRICITY.

If the planet's projectile motion be not perfectly adjuſted to the ſun's attraction, the orbit deſcribed will be an ellipſis. If it be too ſwift, the orbit will be greater than a circle, and the nearer focus coincide with the central body; if too ſlow, the orbit will be leſs than a circle, and the farther focus coincide with the central body.

Indeed the form of the planetary orbits does not only depend on the adjuſtment of the firſt projectile velocity with the ſun's attraction, but alſo on the direction in which that motion was originally impreſſed. If that direction were according to the tangent A B, as above ſuppoſed, and the central forces exactly balanced, the orbit would be circular; but if that direction were oblique, in any manner, whether aſcending to, or deſcending from the ſun, the orbit of the planet, notwithſtanding any adjuſtment of its velocity to the attraction, would be an ellipſis.

The motions of the planets in their elliptic orbits are not equable, becauſe the ſun is not in their centre, but in their focus. Hence they move, ſometimes faſter, and ſometimes ſlower, as they are nearer or farther from the ſun; but yet theſe irregularities are all certain, and follow according to an immutable law.

Thus, ſuppoſe the ellipſis B E P, &c. (*Plate* XIX. *Aſtronomy*, *fig.* 5.) the orbit of a planet, and the focus S, the ſun's place; A P, the axis of the ellipſis, is called the *line of the apſides;* the point A, the *higher apſis* or *aphelion;* P, the *lower apſis* or *perihelion;* S C, the excentricity; and E S, the mean diſtance of the planet from the ſun.

Now the motion of the planet in its perihelion is ſwifteſt, and in its aphelion, ſloweſt; at E the motion as well as the diſtance is mean, *i. e.* it is ſuch as would deſcribe the whole orbit in the ſame time it is really deſcribed in.

The law by which the motion is regulated in every point of the orbit, is, that a line, or radius, drawn from the centre of the ſun to the centre of the planet, and thus carried along with an angular motion, does always deſcribe an elliptic area proportional to the time. Suppoſe, *e. gr.* the planet in A, and thence, in a certain time, to proceed to B; the ſpace or area the radius S A deſcribes, is the triangle A S B: when at length the planet arrives at P, if from the centre of the ſun S there be drawn S D, in ſuch manner, as that the elliptic area P S D is equal to that of A S B; the planet will here move through the arc P D, in the ſame time in which it moved through the arc A B; which arcs are unequal, and nearly in a reciprocal proportion to their diſtance from the ſun. For from the equalities of the areas it follows, that the arc P D muſt exceed A B as much as S A exceeds S P.

This law was firſt demonſtrated by Kepler, from obſervation; and is ſince accounted for by ſir I. Newton from phyſical principles; and to this all aſtronomers now ſubſcribe, as of all others that which beſt ſolves the planetary phenomena. See CENTRIPETAL *Force* and GRAVITATION.

From the equal deſcription of areas about the ſun in equal times, it appears that the planets move with unequal angular velocities about the ſun. Let A P Q (*Plate* XIX. *Aſtronomy*, *fig.* 6.) be an eclipſe deſcribed about the ſun S in the focus, the indefinitely ſmall area, P S p, deſcribed in a given time, will be conſtant; draw P r perpendicular to S p; and as the area S P p is conſtant for the ſame time, P r varies as $\frac{1}{S\,p}$; but the angle p S P varies as $\frac{P\,r}{S\,p}$, and, therefore, it varies as $\frac{1}{S\,p^2}$; that is, in the *ſame* orbit the angular velocity of a planet varies inverſely as the ſquare of its diſtance from the ſun. For *different* planets, the areas deſcribed in the ſame time are not equal, and therefore P r varies as $\frac{\text{area } S\,P\,p}{S\,p}$, conſequently, the angle p S P varies as $\frac{\text{area } S\,P\,p}{S\,p^2}$; that is, the angular velocities of *different* planets are as the areas deſcribed in the ſame time directly, and the ſquares of their diſtances from the ſun inverſely. Hence we obtain a ſolution of the problem, uſually called "Kepler's problem," in the manner ſtated under the article ANOMALY. For the method of finding the equation of the centre, ſee EQUATION; and for the excentricity, ſee EXCENTRICITY.

Computation of a Planet's Motion and Place.—As to the periods and velocities of the planets, or the time in which they perform their courſes, they are found to have a wonderful harmony with their diſtances from the ſun, and with one another. The nearer each planet is to the ſun, the quicker ſtill is its motion, and its period the ſhorter. The great law they here all immutably obſerve is, that the ſquares of their periodical times are as the cubes of their diſtances from the centres of their orbits.

The knowledge of this law we alſo owe to the ſagacity of Kepler, who found it to obtain in all the primary planets; as aſtronomers have ſince found it alſo to do in the ſecondary ones.

Kepler deduced this law merely from obſervation, and compariſon of the ſeveral diſtances of the planets with their periods: the glory of inveſtigating it from phyſical principles is due to ſir Iſaac Newton, who has demonſtrated, that, in the preſent ſtate of things, ſuch a law was inevitable.

A planet's motion, or diſtance from its apogee, is called the *mean anomaly* of the planet; and is meaſured by the arc or area it deſcribes in the time. When the planet arrives at the middle of its orbit, or the point G, the diſtance or time is called the *true anomaly*. (See ANOMALY.) When the planet's motion is reckoned from the firſt point of Aries, it is called its *motion in longitude;* which is either mean, *viz.* ſuch as the planet would have, were it to move uniformly in a circle; or true, which is that with which the planet actually deſcribes its orbit, and meaſured by the arc of the ecliptic it deſcribes.

Hence may the planet's place in its orbit for any given time after it has left the aphelion be found. For ſuppoſe the area of the ellipſis ſo divided by the line S G, that the whole elliptic area may have the ſame proportion to the area A S G as the whole periodical time in which the planet deſcribes its orbit has to the time given: in this caſe G will be the planet's place in its orbit.

The mean motions of the planets might be eaſily determined from their conjunctions and oppoſitions, if we knew the

the places of the aphelia, and the excentricities of their orbits; for then we might find the equation of the orbit, and reduce the true to the mean place; and the mean places being determined at two points of time, give the mean motion corresponding to the interval between the times. But the place of the aphelion is best found from the mean motion. To determine, therefore, the mean motion, independently of the place of the aphelion, we must seek for such oppositions or conjunctions as fall very nearly in the same point of the heavens; for then the planet being very nearly in the same point of its orbit, the equation will be very nearly the same at each observation; and therefore the comparison between the true places will be nearly a comparison of their mean places. If the equation should differ much in the two observations, it must be considered. By comparing the modern observations, we shall be able to obtain nearly the time of a revolution; and then, by comparing the modern with the ancient observations, the mean motion may be very accurately determined; for any error, by dividing it amongst a great number of revolutions, will become very small in respect to one revolution. Professor Vince has illustrated this method by an example in the planet Saturn, taken from M. Cassini, (Elem. d'Astron. p. 362.) and accompanied with the proper explanations. (See his Elem. of Astron.) The mean annual motion of this planet is there deduced to be $12^\circ\ 13'\ 35''\ 14'''$, and the mean daily motion to be $2'\ 0''\ 35'''$. Dr. Halley makes the annual motion to be $12^\circ\ 13'\ 21''$. M. de Place makes it $12^\circ\ 13'\ 36''.8$. As the revolution thus determined is that in respect to the longitude of the planet, it must be a tropical revolution. Hence, to get the sidereal revolution, we must say, $2'\ 0''\ 35''' : 24'\ 42''\ 20'''$ (the precession in the time of a tropical revolution) :: 1 day : $12^d\ 7^h\ 1'\ 57''$, which added to $29^y\ 162^d\ 4^h\ 27'$, gives $29^y\ 174^d\ 11^h\ 28'\ 57''$, the length of a sidereal year of Saturn. By this method we may find the periodic times of all the superior planets. The periodic times of the inferior are found from their conjunctions.

The periodic times of the primary planets, copied by professor Vince in his "Elements," p. 113, from La Lande, are as follow: Mercury, $87^d\ 23^h\ 15'\ 43''.6$; Venus, $224^d\ 16^h\ 49'\ 10''.6$; Mars, $1^y\ 321^d\ 23^h\ 30'\ 35''.6$; Jupiter, $11^y\ 315^d\ 14^h\ 27'\ 10''.8$; Saturn, $29^y\ 174^d\ 1^h\ 51'\ 11''.2$; the Georgian, $83^y\ 150^d\ 18^h$. The latter is unquestionably erroneous, though copied by many writers, without sufficient attention, from La Lande; as we have shewn in our article *Planetary* NUMBERS. It should have been $84^y\ 28^d\ 16^h\ 55'$. From the tropical period assigned in the article just cited, we deduce the sidereal period, thus: As $365^d.242 : 50.3$ (precef.) :: 30589.352 (trop. per.) : $4212''.5$ the precession in Georgian's whole tropical period: then

$$\frac{4212''.5 \text{ whole precef.}}{42''.4 \text{ daily motion}} = 99^d\ 8^h\ 28' \text{ to be added to the}$$

tropical period for the sidereal: consequently

	30589^d	8^h	$27'$	tropical period
+	99	8	28	arising from precession
	30688	16	55	= the sidereal period: and

$$\frac{30688.705}{365} = 84^y\ 28^d\ 14^h\ 55', \text{ the period in years of}$$

365 days, hours and minutes.

N. B. The daily motion of the Georgian in the ecliptic is above taken from La Lande's tables at $42''.4$; but more exactly it is $42''.367$, &c.

For the irregularities in the motions of the primary and secondary planets by their mutual attractions, see ECLIPTIC, GRAVITATION, MOON, NUTATION, PRECESSION *of the Equinoxes*, *Solar* SYSTEM, TIDES, &c.

PLANETS, *the Phenomena of the inferior*, are their conjunctions, elongations, stations, retrogradations, phases, and eclipses. See CONJUNCTION, ELONGATION, STATION, RETROGRADATION, &c.

PLANETS, *Phenomena of the superior*, are the same with those of the inferior; with an additional one, *viz.* opposition.

PLANET, *the particular phenomena, circumstances, &c. of each*, see under the name of the respective planet, &c. JUPITER, MARS, &c.

PLANETS, *Configuration of the.* See CONFIGURATION.

PLANETS, *Theories of the.* See THEORY.

PLANETARIUM, a machine for representing the motions of the primary planets by wheelwork. This machine differs from an *orrery* in this respect, that it does not profess to exhibit any of the diurnal rotations, but confines its operations to the production of the annual motions alone. These motions may be either *mean* or *equated*; the latter of which were first exhibited, agreeably to the Copernican system, by Huygens's automaton, in 1682; and the former by Roemer's planetarium, soon after. It is not, however, our intention to describe, under the present article, any of the planetary machines which may at the present day be considered as obsolete; but to reserve for our subsequent article an historical account thereof, agreeably to the order of time; and to confine ourselves here to a description of those planetaria of our own time, which either have been adopted, or, from their superior powers, appear to us to merit our public notice, as models for future imitation; to some of which we have already referred from our article ORRERY.

Common Planetarium.—It will be seen in our subsequent historical account of PLANETARY *Machines*, that the common planetarium, that presents itself to the eye, as we pass the windows of the mathematical instrument-makers, borrows the numbers of its planetary calculations chiefly from Huygens, and its construction from the planetarium of Roemer, with little or no deviation, except what arises from superior workmanship; and, in some instances, from the addition of the planet Georgian. The common planetarium has its wheelwork represented by *fig.* 1. of *Plate* X. of *Planetary Machines*, the effects produced by which may be thus briefly described; *viz.* *a b c d* is a brass frame, similar to the frame of an ordinary clock, in which are contained twelve wheels and pinions, actuating one another respectively in such a way, as to produce the mean motions of the six primary planets, that have been long discovered, of which our earth is one. A B is a revolving arbor, pivotted into holes made in the upper and lower plates of the frame, and is made to revolve by means of an endless screw, acting with the lowest wheel of 83 teeth, which is made fast to it, as are also the five other wheels and pinions, with the numbers of teeth specified in the figure. C D is an upright stem of steel wire, screwed fast into the lower plate at C, and ascending through a large hole made in the upper plate, which it does not fill. The six wheels revolving round this stem have each a separate tube, to the inferior ends of which they are respectively attached; and the tubes are so contrived, that the exterior surface of the innermost forms a stem for the bore of the next largest, till all the six are fitted one within another round the stem of steel, which keeps them in a vertical position, while they revolve separately with different velocities. The arbor A B, which receives its motion from the handle, by the medium of the endless screw, is assumed as revolving in a year, which may be either civil, sidereal, or tropical; but whichever be the period assume affumed, the pairs of wheels that act together refpectively will be fo many fractions of that period. Thus, the loweft wheel of 83 teeth, on the annual arbor, will drive its fellow 20, with its tube, round in $\frac{20}{83}$ of a year; and the little arm, that is fixed by friction on its fuperior end, will perform a revolution round the fun in the fame time. In like manner, the period of Venus will be performed in $\frac{32}{52}$ of the year; the earth in $\frac{50}{50}$, or one year; Mars in $\frac{75}{40}$; Jupiter in $\frac{83}{7}$; and Saturn in $\frac{147}{5}$; the driving wheels being the denominators of the fractions, and the driven ones the numerators, agreeably to our directions given under the article *Planetary* NUMBERS, for computing the value of wheelwork acting in this fimple manner.

If we affume an exact folar year as the period of the firft moving or driving wheels, then the fractions will produce the periods fubjoined, *viz.*

				D.	H.	M.	S.
Mercury will revolve in	$\frac{20}{83}$	of 365.242, &c.	or	88	0	14	24
Venus - -	$\frac{32}{52}$	of ditto,	or	224	18	20	9
Earth - -	$\frac{50}{50}$	of ditto,	or	365	5	48	48
Mars - -	$\frac{75}{40}$	of ditto,	or	684	19	52	19
Jupiter - -	$\frac{83}{7}$	of ditto,	or	4330	17	30	3
Saturn - -	$\frac{147}{5}$	of ditto,	or	10738	2	54	43

If thefe periods be compared with the true periods given under *Planetary* NUMBERS, it will be feen that the mean motions produced by this fimple mechanifm are far from being accurate, and that the errors, by continual accumulation, will become fenfible in a comparatively fhort fpace of time; but where general reprefentation only is aimed at, and the refpective *times* of the phenomena exhibited by the planetarium are difregarded, this is the cheapeft and fimpleft conftruction of a planetary machine that has yet been devifed; and where its imperfections can be difpenfed with, its fimplicity is no fmall recommendation. Still, however, the *true* places of the planets, depending on the *equations* as well as *mean motions* of thefe bodies, are not the places indicated by this planetarium, fuppofing its mean motions ever fo accurate; nor are the motions of the five recently difcovered planets attempted to be exhibited, which they might be by additional wheelwork, without altering the conftruction of the machine. For the ufe of thofe who are fatisfied with the reprefentation of mean motions only, we beg leave to fuggeft the numbers fuitable for wheels, that will produce the revolutions of thefe five diminutive bodies alfo. Let $\frac{95}{26}$ be taken for Vefta, $\frac{74}{17}$ for Juno, and $\frac{72}{20}$ for both Ceres and Pallas, with one tube only for thefe two pairs; and thefe wheels, acting in the fame way that has been defcribed, will give the mean revolutions with as much accuracy as the prefent ftate of our knowledge of the motions of thefe little bodies will allow. The planet Herfchel would require $\frac{335}{4}$ for its long period, which numbers are impracticable in a fmall machine; but for this planet a train might be fubftituted, fuch as will be defcribed as forming a part of the following machine.

When a planetarium of this common conftruction is fitted up, its appendages are ufually a lunarium and tellurium, feparately adapted to the fame ftand; but in thofe, the annual and lunar trains are never free from confiderable errors.

Planetarium conftructed at the Houfe of the Royal Inftitution.—When the late Dr. Garnett refigned the lectufefhip of the Royal Inftitution, and took his aftronomical and other apparatus with him into Great Marlborough-ftreet, his fucceffor, Dr. Thomas Young, was authorifed by the managers of the inftitution to procure as good a planetarium for his lectures as he could get for about fifty pounds; this being confidered as large a fum as the ftate of the finances would allow to be expended on one inftrument, confiftently with the other demands of the apparatus room. The doctor, in confequenee of the permiffion thus given him, examined the fhops of the different mathematical inftrument-makers for a machine already made, which might be confidered as adequate to the illuftration of the folar fyftem, in a large and magnificent lecture room. His inquiries, however, were unfuccefsful; but having heard that aftronomical mechanifm was a fubject which had occupied the attention of the Rev. W. Pearfon, he introduced himfelf to that gentleman in the autumn of 1801, for the purpofe of conferring with him on the fubject. The refult of this conference was, that, being a proprietor of the Royal Inftitution from its firft eftablifhment, and having confequently an intereft in promoting its fuccefs, Mr. Pearfon agreed to calculate, contrive, and draw a plan for a new inftrument, which was accordingly done, and put into the hands of Kenneth M'Culloch, an old but ingenious workman employed at that time in the workfhops of the inftitution.

The materials being prepared, the machine was begun in the fummer of 1802, and finifhed in that of 1803, after having been ufed, in an unfinifhed ftate, in the fpring courfe of lectures of the latter year. The arrangement and dimenfions of the various parts of the machine are as follow, *viz.* In *fig.* 2, A B C D reprefent a ftrong frame of mahogany, well feafoned, and firmly put together, 5 feet 2 inches high, and $2\frac{1}{2}$ feet acrofs; the two upright pieces of which are each in fubftance 4 inches by $1\frac{1}{2}$, and braced, as feen in the figure; and the crofs foot-pieces are each 32 inches long, for the fake of fteadinefs. Above the crofs bar, A B, is another bar E F, 6 inches from the former, which turns upon very ftrong metallic pivots of five-eighths of an inch

diameter,

diameter, upon brafs bearing-pieces, at E and F, which are divided acrofs the centres of their holes, and allow the bar to be taken off and put on at pleafure, by means of a joint, that permits the upper part of each bearing-piece to be turned back. To the fhoulders of the pivots are attached the femicircular brafs plates, G, G, one-fourth of an inch thick, in which holes are drilled in the horizontal and perpendicular lines, and alfo at 45°, and at other intermediate angles; into fome of which holes two fteel bolts, H, H, placed on the bar A B, are inferted, to fuftain the mechanifm, placed on the moveable bar E F, in any given pofition. This method of mounting the fuperftructure gives a degree of fteadinefs, which could not be obtained from a central joint, and is equally capable of different degrees of elevation. It was found neceffary, however, to have a contrivance for either difcharging or locking both the bolts at the fame time; which contrivance was the invention of K. M'Culloch, and anfwers its purpofe completely. The mechanifm is fimply this: a thick circular plate of brafs has an arbor rivetted into it, which paffes down through the centre of the fixed bar A B, and has a thumb-piece, I, inferted below, and clofe to the bar, on a fquare filed upon its lower extremity, and pinned faft. The circular plate lies with its plane flat upon the bar, with the upper end of the arbor projecting a little; then a diametrical line being drawn acrofs the plate, and divided into two equal parts, a femicircle is drawn from each of the two points, which lie equidiftant at oppofite fides of the centre, with fuch a radius, that the diameter of each may be equal to the portion of the bolt which requires to be drawn out. One of the fmall femicircles is drawn entirely upon one femicircle of the plate, and the other upon the other; after which the two defignated fmall femicircles are perforated in various places, nearly in the fhape of an S, and the intermediate folid parts filed away, and rendered perfectly fmooth with a burnifher. Each bolt is bent in the form of a half-crank, the remote ends of which are cylindrical, and pafs through two cocks fixed on the bar A B; whilft the interior ends are flat, and move each in a dove-tailed groove, made in the wood of the bar under the metallic plate. A fteel pin, fixed into each fliding brafs bar of the crank-piece, exactly fits, and paffes through each femicircular perforation of the circular plate, and completes the contrivance. The manner of applying this mechanifm to its purpofe is this: as the thumb-piece below the bar, A B, is faft to the arbor of the circular plate above the bar, turning it half round carries the plate along with it half a turn; in confequence of which, the metallic pins, rivetted into the fliding bars of the cranked bolts, are made to approach to, or recede from, the centre of the metallic plate, by reafon of their connection with the fmall femicircular perforations, accordingly as the thumb-piece is turned one way or the other half round; and thus both the bolts are pufhed in or out at pleafure by the mere turning of the thumb-piece, and will be kept faft to their places in any fituation without an additional fecurity.

Having defcribed the ftand of this planetarium, and pointed out the application of its different parts to conftitute a whole, we come next to particularize the mechanifm which the fuperftructure is compofed of, and to fhew the mutual relations of the various portions to each other, in regular fucceffion. The wheelwork, which conftitute the ratios of the velocities of the different bodies, claim our firft notice.

L M N O, in *fig.* 3, is a frame of ftrong brafs, kept together by four brafs pillars, faftened at both ends by thick fcrews, fo that either the upper or the lower plate will take off feparately. The length of each plate is $11\frac{1}{4}$ inches, and the breadth 7; and the height of the pillars between the plates $2\frac{1}{2}$. This frame contains the trains of wheelwork, which produce the refpective revolutions of all the primary planets that had been difcovered at the time of its invention, including Ceres and Pallas. To fhorten the defcription, we will poftpone the dimenfions of the wheels, and infert them in a table, where the reader may refer to them after.

At R is an arbor projecting downwards, pivotted into the upper and lower plates of the frame, and revolving, by the application of any power, in the affumed period of an exact folar year. Q Q is an arbor fcrewed faft to the lower plate, and, inftead of revolving itfelf, fuffers all the wheels which are borne by it to revolve loofely round it. P P is another arbor of the fame kind, but longer, and extending 5 inches upwards above the frame, to fupport the fun and his mechanifm. To give the reader a competent idea of the operation and order of the different trains, we will firft lay before him the following Table, and then explain it, as it has a reference to the drawing where the fame numbers occur.

Order of the Trains.

	Revolving Arbor R.	Fixed Arbor Q Q.	Tubes over P P.
Mercury -	90	22 68	67
Venus -	113	32 29	63
Earth -	60	60 60	60
Mars -	53	56 50	89
Ceres Pallas -	21	121 60	48
Jupiter -	22	111 40	94
Saturn -	7	124 59	98
Georgian, or Herfchel	7	105 12	67

1ft. The wheel of 90 is placed firft, or loweft, faft to the revolving arbor R, and drives the wheel of 22 round the fixed arbor Q Q; and along with it the contrate wheel of 68, which is attached to it, and which drives the contrate or laft wheel of the train 67, fixed on the longeft and innermoft tube, to the top of which is fixed the radius vector of Mercury. The communication is made from 68 to 67 by the medium of two fimilar pinions.

2dly. The wheel of 113 is fixed next over the 90, on the arbor R, and drives its fellow 32 round arbor Q Q, together with 29, to which it is faftened; the latter of which impels the fecond tubed wheel of 63 round in the tropical period of Venus.

3dly. Four wheels of each 60 teeth are employed in a fimilar manner, to produce the earth's revolution in an exact folar year; and the laft of the four is faftened to the third revolving tube, to carry the annual bar, or radius vector of the earth.

4thly. A

4thly. A wheel of 53 fucceeds on the arbor R, to drive round Q Q the wheel of 56, to which is faftened the wheel 50, to actuate the fourth tubed wheel of 89 in the tropical period of Mars.

5thly. A fmall wheel of 21 is next mounted on the arbor R, to drive 121 round Q Q, and with it 60 as a fellow for 48, to which is attached the fifth revolving tube, which carries both Ceres and Pallas round in the fame period; the difference of their refpective velocities being not yet fufficiently afcertained to require a difference in the wheelwork.

6thly. The fmall wheel 22 comes next on the arbor R, and drives 111 round Q, and alfo with it 40, as a fellow for the fixth tubed wheel of 94, with which is connected the radius vector of Jupiter.

7thly. The long pinion of 7, which is cut in the folid part of the arbor, is common to both Saturn and Georgian, and drives the wheel 124 round the fixed arbor Q Q, and with it 59, as a fellow, to impel the feventh tubed wheel of 98 in Saturn's period.

Laftly: The faid pinion of 7 alfo drives, by its upper end, the wheel 105, and along with it the perforated pinion 12, which makes the wheel 67 together with the eighth tube revolve, and conduct on its upper end the radius vector of Herfchel.

This is the *order* in which the wheels ftand when they act; and their number might have been diminifhed one half, if accuracy in the calculations had not been confidered as a primary object. But to obtain a great degree of accuracy, the numbers that conftitute the ratios of a year neceffarily run high, and render it unavoidably requifite to break the high fimple fractions into compound ones of fewer figures, but of the fame value; or, which is the fame thing, it became expedient to fubftitute, in the moft convenient manner, a train of wheels for each planet, inftead of a fimple pair, where great accuracy muft have been out of the queftion. By this adoption, it will be feen in the fubjoined table of the powers of the wheelwork, that a greater degree of accuracy is attained than had perhaps ever been before accomplifhed; and that not merely in one, but in all the revolutions of the different primary planets.

But before we give the tables of dimenfions and powers of the wheelwork, it will be proper to obferve that *fig.* 4, which is an end-view of the frame, reprefents three brafs bridges, with tubes faftened to them, to be interpofed between the revolving tubes, in order to bear the weight of the machinery, and to take off the friction, which would otherwife have been too confiderable to be difpenfed with. The firft bridge, 1,1, fpans over the tubed wheel of Mercury, and has its tube next in length to that of Venus, that a motion may be derived therefrom to the fun's axis. This bridge is fcrewed to the upper fide of the lower plate of the frame. The fecond bridge, 2,2, with its tube, is placed over the tubed wheel of the earth, and is faftened by fcrews upon the lower plate, like the firft bridge; and the third bridge, with its tube, lies between the tubed wheel of Saturn and that of Jupiter, and is fupported by the upper plate of the frame, and is therefore inverted.

Powers of the Wheelwork.

Planets.	Fractions of a Year, or Trains from 365.24222 Days.	Periods of the Wheelwork.	Periods by Lalande's Tables.

But

But notwithſtanding the mean motions of all the planets are repreſented by this wheelwork with extreme accuracy, yet, if they were all *equable*, the true apparent places of the planets would not be accurately exhibited, except at the aphelion and perihelion points of their orbits, where the aggregate of all the increments and decrements of motion balance one another, *i. e.* where there is no equation of the centre, or proſthaphæreſis; for all the planets, that have any conſiderable excentricity in their orbits, continue many days longer in one half of their orbit than in the other: for inſtance, Mercury, as we have ſaid in another place, continues about $55\frac{1}{2}$ days in one half of its orbit, and only $32\frac{1}{2}$ in the other; and even in the earth's motion, the difference amounts to 7.8 days, where the excentricity of the orbit is very ſmall. Hence ariſes the neceſſity of ſome mechanical means for accelerating and retarding, alternately, the various motions of the different heavenly bodies in the reſpective parts of their orbits, that the heliocentric places may accord, from day to day, with the places calculated in the Nautical Almanac, and in White's Ephemeris; and alſo that the days of oppoſition and conjunction, the times of the ſtations, and the reſpective durations of the apparent direct and retrograde motions, may be all accurately indicated; none of which, a machine repreſenting only mean motions can have any pretenſions to effect, however accurately its wheelwork may be calculated. Likewiſe, to make the geocentric appearances what they are in the ſky as ſeen from the earth, and what they are calculated to be in the Nautical Almanac, and in White's Ephemeris, the *variable diſtances* muſt be alſo repreſented, otherwiſe the greateſt elongations of Mercury, and the annual parallaxes of the ſuperior planets, would always remain the ſame, as though their orbits were in concentric circles round the ſun.

To effect the two requiſites of varying velocities and of varying diſtances, the two following contrivances are adopted, which, without adding much to the complexity of the mechaniſm, completely produce both the deſired effects, and conſequently all the phenomena dependent upon them: firſt, the tubed wheels of thoſe planets, which have conſiderable excentricity, and conſequent variation of motion, have their teeth cut in ſo peculiar a manner, that the ſize of them varies gradually throughout the whole of each ſemicircle, ſo as to throw juſt ſo many teeth more into one half of the wheel than into the other, as are proper for producing *one half* of the grand equation of each planet; and, ſecondly, a ſmall arm ſuſpended at the extremity of each radius vector, and revolving with the planet in a retrograde direction, by means of an appended weight, ſhews both the *variation of diſtance*, and alſo the *other half* of the grand equation. The weight, too, is adjuſtable, ſo as to make the aphelion and perihelion points fall in their proper places in the ecliptic; and what is a wonderfully lucky coincidence of circumſtances, the ſame mechaniſm, that anſwers theſe purpoſes, preſerves, moreover, the paralleliſm of the axis of every planet, as well as of the ring of Saturn. The proportion between the radius vector and ſhort arm of each planet is as the radius of the planet's orbit to its excentricity; the radius *plus* the excentricity being equal to the aphelion diſtance, and the radius *minus* the excentricity being equal to the perihelion diſtance. See Equation *Mechaniſm*.

It would exceed the limits of this deſcription, were we to introduce here the proper directions for cutting the tubed wheels in the requiſite manner. Suffice it, therefore, to ſay, that the inventor lent to the inſtitution a cutting engine of his own, on the plate of which he had previouſly divided all the required circles in ſuch a way, as would neceſſarily divide and cut the wheels in a proper manner by its ordinary operation, without any extra ſkill in the workman. The danger of inaccuracy, in the execution of this otherwiſe extraordinary proceſs, was thereby obviated; and he had the ſatisfaction of ſeeing a practical difficulty vaniſh, which might have proved inſuperable to the mere theoriſt. Care, however, was previouſly taken to aſcertain that the largeſt and ſmalleſt tooth of every wheel were capable of being acted upon by the mean-ſized teeth of the driving wheel, with which each tubed wheel had to co-operate; but it was found that the diſparity between the largeſt and ſmalleſt teeth of Mercury's tubed wheel was too conſiderable to admit of the ſame method of cutting the teeth, that would apply to the reſt: hence, had no other practicable method of effecting half the equation of this planet preſented itſelf, the motion could not have been made perfect enough for the requiſite purpoſe; but fortunately a ſecond method occurred of producing the required degree of acceleration and retardation, and that without any inequality at all in the teeth, which was that of placing the tube as much out of the centre of the wheel as is equal to the excentricity of the orbit, the radius of the wheel being taken as its radius. The wheel conſequently was made a contrate one, and takes its motion from its fellow, by the interpoſition of two pinions placed at oppoſite ends of an horizontal arbor; which arbor is ſuſtained by the lower plate of the frame, and pivotted into a cock at each end. The pinion which drives the excentric contrate wheel was, therefore, required to be longer than double the excentricity of the wheel, that it might not eſcape its teeth: likewiſe the ſpaces of the wheel were required to be filed with an equalling file, held in a direction pointing not to its centre, but to the excentric point in which the tube is fixed, in order that, during its action, the friction might be as little as poſſible.

This method of producing unequal motion, we have before ſaid, was firſt applied by Huygens in his automaton planetarium; but we have ſhewn (under Equation *Mechaniſm*) that he miſtook the effect, by ſuppoſing that the *whole* equation would be thus produced, whereas, in fact, only *one-half* of it is effected, which is what the inventor's purpoſe requires.

As the exact periods and other data of the orbits of the two newly-diſcovered planets, Ceres and Pallas, were not aſcertained with ſufficient accuracy, their tubed wheel was cut, *pro tempore*, into equal teeth, as was alſo that of Venus, by reaſon of her excentricity being too inconſiderable to require notice; but the other planets have the teeth of their tubed wheels ſo diſtributed in the two ſemicircles, which are biſected by the line of the apſides, that one ſemicircle of each contains more teeth than the other, in the proportion expreſſed in the annexed table.

Table of the Teeth contained in the reſpective Aphelion and Perihelion Semicircles.

	Aphelion Semicircle.	Perihelion Semicircle.	Wheels.
	Teeth.	Teeth.	
Mercury -	37.9	29.1	67
Earth - -	30.3	29.7	60
Mars - -	47.2	41.8	89
Jupiter - -	48.4	45.6	94
Saturn - -	50.75	47.25	98
Georgian, or Herſchel	34.6	32.4	67

The

The above table will aſſiſt the workman in eſtimating the perfection of the cutting by an engine with appropriate unequal diviſions; for when a diametrical line is drawn from the aphelion to the perihelion points marked on each wheel, each of thoſe ſemicircles will contain the ſame number of teeth, notwithſtanding another line biſecting this at right angles will contain thoſe proportions which are expreſſed in the table; an examination of this kind will be a check upon the workmanſhip.

The tubes move round one another without the leaſt ſhake, and extend above the frame unequally, the innermoſt, or longeſt, being $6\frac{1}{2}$ inches long, and $\frac{5}{16}$ bore, and the outermoſt, or ſhorteſt, $\frac{5}{8}$ths of an inch long, and $1\frac{1}{4}$ bore; they go within one another, as in the common planetarium, in order that all the radii vectores may be borne by the upper ends of their reſpective tubes.

Fig. 5. exhibits to view the under face of the lower plate of the frame, in which the ſame letters denote the ſame parts as in *fig.* 3.

This lower plate of the frame, that contains the wheel-work, is bedded into and ſcrewed faſt to the upper ſurface of the moveable croſs-bar of mahogany E F, ſo that the tubes may be exactly over the middle of it; and the upper plate of the ſaid frame is bedded into, and made faſt to a circular mahogany board of forty-ſix inches diameter, to which it is attached by ſeveral ſtrong braſs bars, which are ſcrewed both to the braſs frame and to tapped braſs nuts let into the circular board below: the tubes project through a central hole, made in the large circular board, juſt large enough to admit them to paſs through it: the frame and circular board, therefore, may be put into either a horizontal or perpendicular direction, or into any intermediate elevation, in any of which poſitions it will be kept ſteady by the bolts H, H. The circular board is compoſed of many ſeparate pieces of wood, fitted together in ſuch ſhapes, and in ſo compact a manner, as to prevent its warping, in doing which, the contriver, M'Culloch, ſhewed great ingenuity: this circular board is painted blue on its upper ſurface, and has a large ecliptic mounted upon it by means of twelve perforated pillars of blackened wood, through which metallic rods paſs and ſcrew at both ends, above into fixed nuts under the ecliptic circle, and below into looſe nuts under the circular board, ſo that the ecliptic may be mounted or diſmounted at pleaſure. This ecliptic circle, which is three feet and a half diameter within, and four feet and a half acroſs the extremities, has the characteriſtic animals, or ſuppoſed animals, beautifully painted in oil colours on a black ground, and ſurrounds all the radii vectores, and therefore muſt be conſidered as the Earth's orbit projected into the heavens beyond the planetary ſyſtem; it ſerves admirably to rectify the planets by, and alſo to aſcertain all their heliocentric and geocentric places, at the ſame time that it adds greatly to the grandeur of the tout enſemble appearance of the machine, when in an erect poſition before an audience.

The radii vectores, ſhort arms, weights, and the other viſible parts of the mechaniſm, for the ſake of effect, are alſo painted blue, except the ivory balls which repreſent the planets, the contraſt between which and the blue ground behind, gives the ſemblance of real motion, without mechanical means, to an eye placed in front, at the remote part of the theatre.

A ſpectator viewing the planets obliquely, will moreover perceive them project beyond the ecliptic in one-half of their orbits, and retire within it in the other, which motion conſtitutes their variation of latitude, or deviation from the plane of the ecliptic; another effect which is not uſually ſhewn by a planetarium; and the quantity of latitude north or ſouth of each planet is indicated by ſmall fixed hands pointing to the reſpective ſmall revolving plates borne by the projecting ſtems of the radii vectores; which plates are ſilvered, and properly divided and figured by an engraver. The planets Mercury, Ceres, Pallas, and Mars, having no ſecondaries, have their latitudes ſhewn by a bend on the exterior ends of the projecting ſtems of the radii vectores, round which bent parts the ſmall arms revolve, ſo as to make their reſpective angles with the plane of the ecliptic. This method of ſhewing the latitude is very ſimple, but requires the ſmall arms to be elongated beyond what they would have been, when moving in the plane of the ecliptic, in the ſame proportion that the hypothenuſe of a right-angled triangle is to its baſe, the included angle being ſubtended by ſuch a perpendicular line as will be a ſine to the requiſite degrees of heliocentric latitude, at the diſtance from the ſun of the radius vector of each planet.

The ſtems on which the arms and weights revolve ſcrew into nuts under the ends of the radii vectores, by means of which the inclination of the bent ends may be ſet to any particular ſituation, ſo as to make the nodes fall in their due places with reſpect to the ecliptic; and by being thus adjuſtable, the ſtems may be eaſily rectified for the motion of the nodes at the end of every century, or longer period of time. The idea of bending the ends of the ſtems was ſuggeſted by Dr. T. Young, and affords a ſimple method of effecting the latitude of all the planets in queſtion, except that of Pallas, the latitude of which is too great to be altogether repreſented by ſuch a limited arm as the other parts of the mechaniſm will allow: the planet Venus having conſiderable latitude, and very little excentricity, required a different contrivance, as did alſo thoſe planets which have ſecondaries; otherwiſe the planes of the orbits of the ſecondaries would have been turned into various angles, as they regard the ecliptic, in different ſituations of the radii vectores. The application of an inclined circular plate promiſed beſt to produce the deſired effect of raiſing and depreſſing Venus, and the ſyſtem of Jupiter, Saturn, and Georgian or Herſchel, and were therefore adopted. The action of the inclined plate on the ſtem of the planet, is cauſed by a notch on the ſtem reſting againſt the edge of the fixed plate, while the ſmall arm, revolving round the ſaid plate, carries the ſtem round it; by which means the planet carried by the ſtem projects and recedes alternately, as much as one edge of the circular plate is more prominent than the other. This effect is not eaſily comprehended from a ſimple verbal deſcription, but is readily perceived in the machine.

With reſpect to the diſtances of the planets from the ſun, it was impoſſible to obſerve the exact proportions without making the ſun's ball very minute, and Mercury cloſe to it, or elſe Georgian at an immenſe diſtance from the ſun; in which caſe the machine muſt have been a horizontal one, and the ecliptic circle in another ſituation. It was, therefore, determined, that though the *exact proportions* of diſtance could not be preſerved, yet the lengths of the radii vectores ſhould be in due proportion, as far as to Mars incluſively, upon a ſcale that made the Earth five inches from the ſun, and that the longer radii vectores ſhould be an exact fractional part of their due lengths, rather than have no proportion at all, as is the caſe in the common planetaria.

Theſe lengths of the radii vectores, and the correſponding lengths of the ſhort revolving arms which repreſent the reſpective excentricities proportional to the lengths of the radii vectores, are expreſſed in the annexed table.

TABLE

TABLE of Diſtances and Excentricities of the Planets in the Planetarium.

Planets.	Mean Diſtance from Sun in Inches.	Ratio to the Truth.	Short Arms.
Mrcury -	1.94	1 : 1	0.38
Venus - -	3.61	1 : 1	0.025
Earth - -	5.0	1 : 1	0.08
Mars - -	7.61	1 : 1	0.69
Ceres - -	10.35	3 : 4	0.87
Pallas - -	10.35	3 : 4	2.59
Jupiter - -	13.0	1 : 2	0.62
Saturn - -	15.9	1 : 3	0.88
Georgian or Herſchel	19.19	1 : 5	0.91

The radii vectores have each a counterpoiſe, and are faſtened to the ends of their tubes by a clamping-piece of braſs attached to each of them by pins, and made ſo as to be tightened by a ſcrew, which draws the ends near together.

The inclination of the orbits are proportioned thus: *viz.*

The inclination of			Inches.	diſtance is ſubtended by	Inches.
	Mercury -	= 7° 0′ 0″ at	1.94		0.237
	Venus - -	= 3 23 35 at	3.61		0.213
	Mars - -	= 1 51 0 at	7.61		0.247
	Ceres - -	= 10 37 56 at	10.35		1.92
	Pallas - -	= 35 0 42 at	10.35		6.3
	Jupiter - -	= 1 18 56 at	13.0		0.296
	Saturn - -	= 2 29 50 at	15.9		0.69
	Georgian, or Herſchel	= 0 46 20 at	19.19		0.256

It muſt be obſerved, that the ſubtending lines here calculated muſt be doubled to ſhew both north and ſouth latitude; therefore the quantity of riſing and falling, or of projecting and retiring with reſpect to the plane of the ecliptic, muſt be *double* the quantity above expreſſed.

The ſun's mechaniſm remains yet to be explained, which, as we have ſeen, conſiſts of the train $\frac{19}{137} \times \frac{25}{62}$ of Mercury's tropical revolution $= 25^d\ 10^h\ 0^m\ 0^s.223$; the motion is communicated thus; – on the top of Mercury's long tube is faſtened the large contrate wheel of 137, which impels the pinion of 19, to which is attached the wheel of 62, which drives the ſmall wheel of 25 on the ſun's axis round in the ſpecified period, which does not vary a quarter of a ſecond from La Lande's laſt determination of the time of a rotation, as it regards a fixed point: the three laſt wheels with their bearing-pieces are borne by a ſmall braſs bar faſtened to the top of the fixed ſtem of $7\frac{1}{2}$ inches long, round which Mercury's tube revolves, which piece of mechaniſm is ſeen in its proper place near the upper P, in *fig.* 3, under the ſun.

It muſt, however, be recollected that Mercury's tube does not revolve *equably*, by reaſon of its being faſtened into a point, as nearly as may be, $\frac{1}{5}$th of the wheel's radius out of its centre, and therefore a compenſation was neceſſary to equalize the motion of the ſun round the axis, which otherwiſe would have been quicker on ſome days than on others: this compenſation was very eaſily effected, by placing alſo the large wheel of 137, as nearly as may be, $\frac{1}{5}$th of its radius out of its centre, but in the ſemicircle diametrically oppoſite to that of Mercury at the lower end of the tube, in order that when the aphelion tooth of Mercury's wheel is in action with its pinion, the perihelion tooth of 137 may actuate its pinion of 19, which, by reaſon of the excentricity of 137, muſt be a long pinion: thus, when an acceleration takes place in the wheel of Mercury, a retardation takes place in that of the ſun, and *vice verſâ*, by which means the motion of the ſun round his axis becomes equable, the increments of one wheel's motion balancing the decrements of the other.

The inclination of the ſun's axis to a line perpendicular to the plane of the ecliptic is 7° 16′, and it points always to 17° 53′ of Virgo; hence the direction in which a ſolar ſpot will move, whether aſcending, deſcending, or horizontal, to an eye ſituated at the Earth, will be ſeen to depend upon the Earth's ſituation in her orbit, as ſhe has reference to the direction of the ſun's axis. The ſecondaries have no motions by wheelwork, becauſe ſuch motions would have added greatly to the complexity of the machinery, as well as have enhanced the expence.

The appendages of this planetarium are theſe; 1. A light rod is adapted to the Earth's ſtem, and extends to either of the interior planets, to ſhew the retrogradations, ſtations, and direct motions. 2. A rod with a fiducial edge, containing the mean diſtances marked, and having a curve piece at the remote end, applies to the ſun's ſtem, by means of a downward bend, which rod, laid on the ecliptic circle, level with the centre of the ſun, and extending with its oppoſite end to the ſun, will ſerve to place the planets in their due heliocentric places in the rectification, and alſo to aſcertain the places on any given day after they have been in motion: this rod will alſo ſerve the lecturer to point with to any part of the inſtrument during the lecture. 3. The handle, which is in an erect poſition, behind the circular wooden board, when the ecliptic is erect, has a ſingle endleſs ſcrew, ſeen in *fig.* 5, at S, acting with a wheel of 52 ſtrong teeth, placed on the lower end of the annual arbor R, without the frame, ſo that one turn of the handle correſponds very nearly to a week. A large ſpiral face is alſo behind the circular board, removed from the braſs frame L M N O, by the interpoſition of the moveable croſs bar of mahogany E F, to which it is ſcrewed with its centre open for the annual arbor to paſs through, which carries the annual index: to the end of the annual arbor is alſo fixed a pinion of ten, driving a wheel of 100 round in ten years, which wheel has another pinion of ten attached to it, to drive a ſecond wheel of 100 round in 100 years, the uſe of which two wheels, not ſeen, is to indicate the year in each ſucceeding century, for which the inſtrument at any time ſtands rectified, which addition aſſiſts the memory, and ſaves the trouble of frequent rectification. The ſpiral of the ſaid face is quadruple, and is divided into the months and days of the year, taking in the 29th of February in every fourth year, like the ſpiral we deſcribed under our article ORRERY. The wheels for indicating the year and century lie behind the plate of the large ſpiral, and take their motion from the projecting arbor at R, and the figures are read through holes cut in the ſaid plate, the hands of which are ſecured by ſcrews, when ſet to their places. The rectification of this planetarium for a given time is attended

attended with some trouble, and therefore, when rectified, should be guarded against the eye of curiosity. As the wheels have several of them unequal teeth, it is necessary that the aphelion teeth of each should be in action, when the planets are respectively at the aphelion points of their orbits, and that the arms should be made fast when properly placed: when the wheelwork was first put together, the wheels were marked for their places of action, to correspond to the 1st of January 1800; and if these marks be brought in contact for that time, and the arms be put to the corresponding heliocentric longitudes, turning the handle till the hands shew the present time, will always be the surest, as well as easiest way of rectifying: but should the marks be effaced, each planet's distance from the aphelion must be calculated for the time, and both the wheel and arm be placed accordingly in succession. In order to disengage the screw S at any time from the annual wheel of 52 teeth, the cross bar T U (*fig.* 5.) is pushed in, or drawn out, as the case may be, and while it moves in a parallel direction by means of its longitudinal openings, admitting the pin W and screw X to guide them, the diagonal opening V, taking the pin Y of the cock that holds the screw, draws it out of, or pushes it into the wheel's teeth, accordingly as the bar is moved from T towards U, or from U towards T, in either of which situations it may be fixed by the nut of the screw X. The arbor of the screw S is squared, so as to admit of the handle at either end of it, as may be most convenient to the lecturer's assistant, who, standing behind the machine to turn the handle, is concealed from the audience.

The new Planetarium for equated Motions, by the Rev. W. Pearson.—Under our article ORRERY, when describing *the new orrery for equated motions in three parts*, we referred the reader to our present article for that portion of it, which constitutes the planetarium at present under our consideration. This planetarium, being contrived to exhibit the mean motions, the grand equations, and all the variations of distance, as well as of velocity, in the different parts of the respective orbits, demanded a new construction, and consequently new calculations. We have already described the *principle* by which *equated* motion is produced in this machine, under the title EQUATION *Mechanism*, near the end of that article; and have also given an example, under our *indirect method of approximation*, (see *Planetary* NUMBERS,) of the mode of calculating wheels for the motion of Venus, when one of those wheels is *not in a stationary* situation, which mode applies to all the trains of this planetarium, except those of the sun and of Mercury; we must, therefore, request the reader to recur to those two articles, and to make himself master of them, before he proceeds to examine the calculations and contrivances that we now propose to present to him.

Fig. 1. of *Plate* XI. of *Planetary Machines*, presents an elevation of all the wheelwork of their proportional dimensions, and in the state of action; and *fig.* 2. gives a plan of the arm or radius vector of Saturn, which will suffice to explain all the other arms. In *fig.* 1, A B is a section of an ornamental table or stand, broken into two parts at the side A, for the purpose of bringing it into the plate; and the legs are omitted for the same reason, but may be conceived to extend downwards the requisite quantity, as represented in *Plate* V, which gives a perspective view of a similar table. Below A and B, a section of the ornamented rim of the table is seen; at C is the handle turning the horizontal arbor, C D, round in seven days, and the exterior end of this arbor carries a hand to indicate the seven days of the week, on an engraved plate attached to the side rim of the table under B. This period of seven days is assumed as the basis of all the planetary calculations, and therefore all the motions must be traced in succession from this first moving arbor. The inner end of this horizontal arbor is supported by the cock G, screwed to the bottom of the table, and carries a pinion of 18 teeth, that drives a contrate wheel of 61 teeth placed under it, apparently without support: the axis of this contrate wheel is a piece of steel wire, nicely polished, which ascends through a thick brass tube, as high as F, under the sun, and is retained within it, by a screw entering its squared end at F. This thick tube of small bore has a shoulder-piece attached to it, which rests on the middle of the table at H, and the lower end of it is held by a large tapped nut under the table, above the wheel of 61 teeth. By these means the tube stands firmly in a vertical direction, and bears the superincumbent weight of all the wheels and arms, both which are always exposed to view. At F, on the superior squared end of the axis, or wire E F, is fixed fast, by the screw we have mentioned, the pinion 28, which drives another pinion 30 round on the inferior end of the sun's stem: the period of this revolution, or rather rotation, is $\frac{61}{18} \times \frac{30}{28}$ of 7 days = $25^d\ 10^h\ 0^m\ 0^s$, which is the period last determined by La Lande. To the pinion 28 is attached a wheel under it of 53 teeth, by means of a connecting piece of brass tube that surrounds the steel wire, which wheel rests on the top of the brass tube, which in future we shall call the central stem, as though it were solid. The wheel of 53 drives another of 35, supported by a horizontal bearing piece that supports the sun's stem at its opposite end, as seen in the figure; and this bearing piece has a short tube soldered into it below, through which the arbor of this wheel of 35 passes, and receives a pinion of 13 at its lower end; the axis or arbor of pinion 13, and of wheel 35, is detained in a vertical position by a screw above the centre of wheel 35, but so as to allow the wheel and pinion to revolve without any shake of the arbor within the tube: this pinion of 13 drives a wheel of 73 teeth, or rather a ring with the teeth cut on the inner edge, for the sake of making its motion proceed in the requisite direction, and the period of its revolution is $\frac{61}{18} \times \frac{35}{53} \times \frac{73}{13}$ of 7 days, or, which is the same thing, in $\frac{28}{30} \times \frac{35}{53} \times \frac{73}{13}$ of $25^d\ 10^h$, namely, in $87^d\ 23^h\ 14^m\ 36^s$. The ring we have described, therefore, carries the stem of Mercury, and is screwed to a circular plate of brass, the centre of which is fitted so as to turn easily round the central stem without shake. If the mean motion only of Mercury had been wanted, the wheels we have described would have been the whole that the planet would have required, but the equation of the centre required some additional wheels, which are thus applied; a little wheel of 30 teeth is attached to the sun's bearing piece, by the interposition of a piece of brass tube, and therefore has no motion; another similar wheel lies on the circular plate of the ring and acts with it, while the axis of this second wheel of 30 passes through the plate, and takes another similar wheel, under the plate; while the plate and ring therefore revolve together in Mercury's period, the second and third wheels, of each 30, revolve together just once by means of their connection with the first or fixed wheel, round which they are carried; then this motion is communicated to a fourth similar wheel of 30, fixed to the lower end of Mercury's stem, which wheel gives Mercury a rotation on his axis in each revolution; but the stem of Mercury is cranked, as seen in the figure, and as the

the parallelifm of the crank is preferved during its whole revolution, the diftance of the planet will vary conftantly, as well as its velocity, in the manner that has been explained under the article EQUATION *Mechanifm*, above referred to. When the horizontal part of the crank is equal to double the excentricity of the orbit, the equation will be properly reprefented, but the diftances will be better exhibited when the faid piece is equal to the fimple excentricity; there are, therefore, two holes drilled and tapped in this piece, to fuit either condition, but the nearnefs of the planet to the fun will not allow the introduction of the correction, which moft of the other planets have got, as will be prefently explained.

Hitherto the ufual mode of eftimating the value of a common train of wheels has been adhered to, becaufe the two trains that we have examined are fo placed, as to act in the ufual way in ftationary pofitions; but henceforth we fhall have to confider trains, in each of which a certain portion is placed on and carried round the fun by the very arm that is put into motion. In this conftruction, for a reafon that will appear prefently, the fyftem of concentric tubes, contrived by Roemer, and ufed in the common planetarium, is impracticable, unlefs as many fixed tubes could be introduced between them alternately, as there are revolving ones; the motion of each inferior planet is therefore tranfmitted to the next fuperior, beginning with Mercury and ending with Georgian, fo that each calculation is neceffarily that of a ratio between the periods of every pair of contiguous planets taken in fucceffion. In calculating thofe ratios the author had two choices, namely, of the *periodic*, and of the *fynodic* revolutions; one of which, as we have fhewn under the head NUMBERS *for Synodic Revolutions*, is eafily convertible into the other: if the periodic revolutions had been preferred, the wheelwork muft neceffarily have been placed on cocks, bridges, or in other *permanent* fituations; but when fynodic periods are chofen, fome of the wheels will require to be placed, or at leaft will admit of being placed on *moveable* fupports; the latter revolutions were thence chofen, in order to do away the neceffity of cocks and bridges, and the numbers calculated to produce fynodic revolutions, by the *mode* in which they are ufed, produce the periodic revolutions, after an allowance is made for the preceffion of the equinoxes. Thus, if the tropical period of Venus be to that of Mercury as $224^d.69847 : 87^d.96579$, we fhall find, by one of the methods of determining *planetary* NUMBERS, that thefe periods are to each other as $1553 : 608$ very nearly; but the numbers for the fynodic period are here required; therefore let 608 be taken from 1553, and let the remainder, 945, be fubftituted for 1553, as one of the products for two wheels, while 608, the other product, remains unaltered; then while $\frac{1553}{608}$ of Mercury's tropical revolution is equal to that of Venus and alfo $\frac{608}{1553}$ of Venus's tropical period equal to that of Mercury, abfolutely confidered, it will be found that $\frac{608}{945}$ of the tropical period of Venus will be the *fynodic* or relative period of the two planets, Mercury and Venus, from conjunction to conjunction, namely, 144.54 &c. days, which time very nearly correfponds to the period given in our table of mean fynodic revolutions, inferted under the title NUMBERS. Now the factors compofing the ratio $\frac{608}{945}$ are $\frac{38 \times 16}{15 \times 63}$, or in the form of a train inverted, (becaufe the motion is given by Mercury,) $\frac{15}{38} \times \frac{63}{16}$, or otherwife $\frac{63}{16} \times \frac{15}{38}$; but the latter portion is equal to $\frac{30}{76}$, and accordingly we find $\frac{30}{76} \times \frac{63}{16}$ the train adopted in the planetarium before us. The wheel 76 revolves along with Mercury's ring, to which it is made faft, and drives a pinion of 30, revolving on a pin, or ftud, at the pofterior end of Venus's arm, by which it is carried; then a pinion of 16 made faft to the faid pinion of 30 acts with the wheel of 63, by the intervention of a pinion 14, the office of which is merely to change the direction of motion, without affecting the velocity. The wheel of 63, however, though connected with the train in the way we have mentioned, is made faft to the central ftem, by clofe fitting, and therefore does not move, but by its refiftance caufes the arm of Venus to move inftead, thereby making the pinion of 14 revolve round it, and producing an effect on the motion of the train equal to what would have been produced by one entire revolution of itfelf. In this way the calculations made for fynodic revolutions in all the other trains, produce the requifite tropical periods of all the remaining primary planets, agreeably to the table of wheelwork which we have fubjoined, for the fake of abbreviating our defcription.

Again, the wheel 126, under the arm of Venus and made faft to it, drives a pinion of 26 and its attached pinion of 32, both which revolve on a ftud on the earth's arm; and the intermediate pinion 13, being refifted by the fixed wheel of 97, revolves round it and carries the earth's arm round the fun in a folar year, as it regards the ecliptic; but as it regards Venus, in the proper fynodic period of 583.9 &c. days. On the earth's arm are carried the wheels and pinions for preferving her parallelifm and alfo for producing the moon's period, both which are effected with great accuracy: juft above the faid arm the wheel of 107 is fixed to the central ftem, and by its refiftance gives motion to the wheel 62, which again impels another wheel of 107 in a contrary direction, thereby producing true parallelifm; in the mean time wheel 86, made faft to wheel 62, revolves with it on a ftud, and, through the medium of a fmall wheel of 32, for changing the direction of motion, impels the pinion 12, with which the moon is connected. The lunation thus occafioned is $\frac{62}{107} \times \frac{12}{86}$ of 365.242, &c. $= 29^d\ 12^h\ 44^m\ 0^s.4$. At a fmall diftance below the earth's arm, and faft to it, revolves the wheel 142, impelling the pinion 28 and with it the pinion 30, refting together on a ftud in the arm of Mars; while the intermediate pinion of 13, refifted by the fixed wheel 134, draws the arm of Mars round in his proper period. To the arm of Mars and not far under it is made faft the wheel 166, which impels the wheel 53, and with it the 34 attached to it, round a ftud on the arm of Pallas, while the intermediate pinion 15, oppofed by the fixed wheel of 154, pulls the arms of both Pallas and Ceres round with the fame velocity in a period which was calculated to be a mean between the two, and as far as we yet know, is not much different from either. At the time when thefe periods were calculated (1806), thofe of Juno and Vefta had not been afcertained, nor had Vefta been difcovered; but room was left during the progrefs of the work for their introduction, and arms were fince inferted on the fame tube that carries the other two arms, which may be adjufted by hand occafionally when their places are required for any particular purpofe; but when the period of thofe little bodies are finally fettled they

they may be alſo repreſented by appropriate mechaniſm. Below the four arms of the little planets, and faſt to their common tube, revolves the wheel 182 in the common period of Pallas and Ceres, actuating the ſmall wheel 40 and its attached pinion 17, carried by a ſtud on the arm of Jupiter, while the interpoſed pinion of 25, taking hold of the fixed wheel 122, conducts the arm round the ſun in its proper period. Again, beneath Jupiter's arm, and attached to it, revolves the wheel 126, actuating the wheels 43 and 41 round a ſtud on Saturn's arm; and the ſmall pinion 11, taking the teeth of both the ſmall wheel 41 and of the large fixed wheel 178, conducts Saturn's arm round in his due period. And, laſtly, the wheel 129 under Saturn's arm moves faſt to it, and drives the ſmall wheels 39 and 28, made faſt together and placed on a ſtud on Georgian's arm, while the intermediate pinion 20, taking the teeth of the fixed wheel 171, thereby conducts Georgian's arm through its revolution by a ſlow motion in its requiſite time. Thus each planet, except the little ones lately diſcovered, from Mercury downwards, has got a train of a moveable wheel, two ſmall wheels united together, a ſingle intermediate pinion, and a fixed wheel; and our explanation of the mode of action of the train of Venus, will apply individually to all the reſt. Before the wheelwork was put together, it was apprehended that there would be a conſiderable portion of time loſt in the tranſmiſſion of motion through all the trains from Mercury to Georgian, when the handle ſhould have commenced its operation, which apprehenſion conſtituted the inventor's principal objection to the theory of the conſtruction, before the machine was put into hand; but Fidler, the workman, being forewarned of this probable imperfection, laid all his teeth ſo deeply into one another, that no one wheel has any ſhake, and the moment that the handle commences its motion, all the wheels of the machine are immediately in action, and conſequently all the planets begin to move, as nearly as can be perceived, at the ſame time. Perhaps a more complete ſtructure of wheelwork was never put together, to anſwer a ſimilar purpoſe, and yet the handle moves with freedom and without any ſenſible jerks. Many of the wheels were at firſt calculated to have ſmaller numbers of teeth, but the nature of the conſtruction required that the fixed wheels, and conſequently ſome of the moving wheels, ſhould be large, in order to guide the arms of mean motion with uniform ſteadineſs, as well as to render all the motions contemporaneous at their commencement.

A TABLE of Tropical Periods produced by the Synodic Trains.

		D.	H.	M.	S.
The handle is aſſumed to revolve in		7	0	0	0
Sun's axis	$\frac{61}{18} \times \frac{30}{28}$ of ſeven days	25	10	0	0
Mercury	$\frac{61}{18} \times \frac{35}{53} \times \frac{73}{13}$ of ditto.	87	23	14	36
Venus	$\frac{30}{76} \times \frac{63}{16} = \frac{945+608}{608} = \frac{1553}{608}$ of Mercury's period =	224	16	41	56
Earth	$\frac{26}{126} \times \frac{97}{32} = \frac{1261+2016}{2016} = \frac{3277}{2016}$ of Venus's period =	365	5	48	39
Mars	$\frac{28}{142} \times \frac{134}{30} = \frac{938+1065}{1065} = \frac{2003}{1065}$ of the Earth's period =	686	22	17	11
Pallas and Ceres	$\frac{53}{166} \times \frac{154}{34} = \frac{4081+2822}{2822} = \frac{6903}{2822}$ of Mars's period =	1680	7	43	23
Jupiter	$\frac{40}{182} \times \frac{122}{17} = \frac{2440+1547}{1547} = \frac{3987}{1547}$ of Pallas's period =	4330	14	28	28
Saturn	$\frac{43}{126} \times \frac{178}{41} = \frac{3827+2583}{2583} = \frac{6410}{2583}$ of Jupiter's period =	10746	20	52	36
Georgian	$\frac{39}{129} \times \frac{171}{28} = \frac{2223+1204}{1204} = \frac{3427}{1204}$ of Saturn's period =	30589	7	18	58
Moon	$\frac{62}{107} \times \frac{12}{86}$ of 365.242 &c.	29	12	44	0

In computing the exact value of each of thoſe periods in ſucceſſion, we have had no reference to the true periods as given in La Lande's Tables, but have deduced each period from that of the preceding planet, as produced by the wheelwork, which is the only true method of appreciating the real values; and if theſe periods be compared to thoſe of the planetarium made at the houſe of the Royal Inſtitution, or indeed to thoſe of any other machine, they will be found to claim a preference, as to accuracy, in many of the periods, and are inferior in none, except in thoſe of the Earth and Jupiter; but in all the other planetaria the earth is *aſſumed* as having its period *exact*, and is made the ſtandard by which the others are guided, and therefore requires no calculation for particular wheels; whereas in this machine all the periods are derived from the motion of the weekly handle; and with reſpect to Jupiter, when the periods of Juno and Veſta are introduced, his period will neceſſarily be altered by the new calculations that will be introduced to complete the motions of all the primary planets.

The reader will recollect that when we explained the mode of converting a tropical calculation into a ſynodic train, we ſubtracted the denominator of the large ratio, put into the form of a fraction from the numerator; that is, we *ejected unity* from the value, as a compenſation for the *addition* made to each revolution by the *mode* in which the wheels are placed

placed to act; we have therefore, in reversing the operation to find the value of the train for a tropical period, substituted + for −, and by this substitution have given in their lowest terms the identical numbers that the author calculated to express the ratios of the respective tropical periods, before they were metamorphosed into numbers suitable for synodic trains. If we conceive, when all the planets are in motion, that the first mover is Georgian and the last the handle, which would be the case, if any external force were applied to Georgian's arm instead of to the handle, then the explanation will be obvious of the necessity that exists for *ejecting unity* out of each improper fraction, that is composed of the ratio of any two contiguous periods. Let us suppose Georgian's arm pushed forward by any force in the direction of the planet's proper motion, then, by looking at the figure, we shall see that the lowest wheel 171, which is made fast to the central stem, will produce a motion in the little pinion 20, which is given again to the small wheel 39, by the medium of its attached wheel 28; but wheel 39 cannot revolve without moving its fellow, or wheel 129 made fast to Saturn's arm, therefore Saturn's arm must evidently have a motion from this direct action of the small wheels; but the small wheels in question are supported by and carried round upon Georgian's arm; and if they did not revolve at all, by their connection with Saturn's arm they would make Saturn revolve in the same time with Georgian; or in other words, if pinion 20 were even detached from wheel 171, Saturn's and Georgian's arms would move as one arm, on account of the connection of the small wheel 39 with the large one 129, the former being fast to one arm, and the other to the other. Thus the arm of Georgian in each of its revolutions, *pushes* Saturn's arm *once* round independently of the direct effect of the train, and hence the number of Jupiter's revolutions in one of Georgian was diminished by *one*, when the wheelwork was calculated; which diminution shews the inventor's foresight as well as ingenuity; and hence we must add *one* of those revolutions to the revolutions simply produced by the train, in order to obtain the combined effect of the two separate causes of motion.

In the same way Saturn's arm may be said to push that of Jupiter once round in each of Saturn's revolutions, and so of the rest till we arrive at Mercury, which is pushed by Venus in the manner we have described, when the moving force is applied at Georgian. The same effect takes place when the force is applied at the handle, but on that supposition is not easily explicable by inspection.

From what has now been explained, it will be perceived, that all the arms, or radii vectores of the planets, are so connected together, like so many links of a chain, that no one can move without giving motion to all the rest, and that therefore when once rectified they will be always so for some specified year or other, which may be known from the situation of Georgian's arm, that rests on a roller supported by the large ecliptic plate surrounding the table; and the month will be indicated by the earth's arm, as well as the day by the index at the handle. But these motions of the arms, partly derived from the wheels and partly from the mutual connection of the arms themselves, are *mean motions*, like the motions produced in the common planetarium; and it remains yet to be explained, why the inventor preferred the more complex construction.

In *fig.* 2. Saturn's arm is detached, in order to shew how the equations and variations of distance are effected in all the orbits by the help of the mean motions: this arm, like Jupiter's and Georgian's, is made of wood, and gilt, for the sake of lightness; but an edge-bar of brass is screwed to it, to give it strength, which is in contact with it the whole length from A to B: immediately above the centre of motion of this arm is a pulley, fixed to the central stem between the arm and the fixed wheel, indeed the pulley is made fast to the under face of the wheel; then another similar pulley is placed on the remote end of the arm, so that an endless gut, embracing both, may give motion to the pulley at B, as the arm revolves round the fixed pulley under the wheel A. Under the pulley, B, is an oblong aperture in the arm, through which the stud passes, on which the pulley revolves, and as this stud is tapped into a screw below, a nut fixes it so that any degree of tension may be given to the gut that may be requisite for moving the pulley, or even for supporting the weight of the arm's appendages. A short arm, B C, is made fast to the pulley B, and revolves with it once in each revolution of Saturn, by reason of the two pullies being of the same dimensions; but the motion is in a contrary direction to that of the arm; now, we have shewn, under our article EQUATION *Mechanism*, that if the short arm, B C, bear the same proportion to the radius vector, or long arm A B, that the mean distance of the planet does to the excentricity, a point fixed at C will describe an *excentric circle*, very nearly similar to the real orbit of the planet, and all the variations of *distance* will be exhibited as nearly to the truth, as such an orbit is to the true elliptic orbit itself; and in all the orbits of small excentricity, the difference, even on a large scale, is hardly perceptible. But though such a point would always shew the distances properly, it would produce only *one-half* of the acceleration and alternate retardation on mean motion that is due to such excentricity; and doubling the short arm B C, so as to make it give the whole acceleration and retardation, or, which is the same thing, the whole *equation of the centre*, would exhibit improper variations of distance, by giving them in excess by one-half; therefore to fulfil the two conditions of variable velocity, and of variable distance, the short arm B C was made equal to $\frac{3}{2}$ds of the excentricity, or once and a half, and another short arm, C D, was made to revolve round its extremity *twice*, while the arm B C revolves once, that is, twice in each revolution of the planet; this effect is produced by another couple of pullies, one just double of the other, the larger one fixed fast over pulley B, and the smaller over the point C, while the stem of the planet rests at the point D, at the remote end of the second small arm; under these circumstances the smallest arm C D, which is just one-third of the length of the other small arm B C, has a direct motion, while that of the other arm is retrograde, and the effect produced by their united motions is a due representation of both the *equation* and *distances* in every part of the orbit. But in order that the little arms might have the proper motions imparted to them, it was necessary that the pulley A should be fixed immoveably, which would not have been the case had it been inserted on a revolving tube, and as each arm has a fixed pulley, like that of Saturn, which we have described, as well as a fixed wheel, the system of concentric revolving tubes was evidently incompatible with the demands of this construction. On the axis of pulley B, and under it, close to the long arm, is made fast a silvered circular plate, that contains the equations and latitudes of the planet, and this plate, when fixed in its due situation by the nut under the arm, is pointed to by a hand attached to the pulley, that revolves along with it. Thus, not only is the planet carried in its excentric path, according to the Keplerian law of planetary motion, but its equation and latitude are also indicated, at the same time that the mean motion is referred to the large ecliptic by the long arm of equable motion; so that the exact correspondence between the construction of the planetary tables, and of the motions produced by this machine, affords the best possible illustration of the process by which the places of the planets are calculated for the Nautical Almanac, and the machine may be considered as a species of perpetual self-calculating almanac.

It is true, the planets are made to revolve all in the same plane, which, in an horizontal machine, could not well be avoided, yet the stems of those that deviate any sensible distance from the ecliptic, are composed of tubes that draw out, or push in, to the required marks made on them, by way of graduation for latitude; and therefore, as the silvered plates exhibit the quantum of latitude, north or south, at all times, it is an easy matter to draw out, or to push in, at any time, the planet's stem, till the planet stands at its due latitude, as seen from the sun, on that particular day. The proportional distances, however, of all the planets could not possibly be preserved in the lengths of the arms, and therefore the subjoined proportions were adopted, which we will give in a table that shall contain also the corresponding lengths of the second and third arms.

Lengths of the respective Arms.

Planets.	Radii Vectores.	First short Arms.	Second short Arms.
	Inches.	Inches.	Inches.
Mercury	1.54	0.62	0.0
Venus	2.9	0.0	0.0
Earth	4.0	0.0	0.0
Mars	6.1	1.14	0.0
Vesta	9.4	1.17	0.39
Juno	10.6	4.04	1.34
Ceres	11.06	1.31	0.43
Pallas	11.06	4.15	1.38
Jupiter	20.8	1.50	0.50
Saturn	$\frac{3}{4}$ = 28.65	2.48	0.83
Herschel	$\frac{1}{2}$ = 38.4	2.70	0.90

From this table it will be seen that none of the planets have two small arms till we come to Vesta, and the reason is, because their mean distances from the sun are too small to admit of such addition, and also Venus and the Earth have their equations too small to require them. We might also have added a table of dimensions of the wheelwork, if there had been any difficulty in obtaining the due sizes, but as each train may have its wheels of any diameter, provided its large driving wheel be larger than its subjacent fixed one, in order to admit of an intermediate pinion of any number of teeth, the workman may fix on any dimensions that will admit of teeth to be from eight to ten *per* inch, provided those pairs which act together be duly proportioned to each other. In the trains of the Sun, of Mercury, and of Venus, where there is but little stress on the teeth, the wheels may have 14 or 15 teeth *per* inch, without any danger of injury. In the train of Georgian the driving wheel of 129 has only about seven teeth in the inch. The wheels on the Earth's arm have their diameters limited, the distance from the sun to the Earth being exactly four inches; hence the diameter of each of the wheels of 107 teeth is 2.53 inches, that of 62, 1.47, and that of 86, 2.0, and each of them have 13.4 teeth in every inch of their geometrical circumference. The satellites are made to move by hand, as in other planetaria, and the dimensions of the ivory balls are optional. What we have said under our article Orrery, respecting the *rectification* of that machine, will apply to a planetarium also; we will therefore conclude our account of the present planetarium by subjoining such tables as are requisite for graduating the silvered faces that indicate the equations and latitudes of the planets, which tables will be a proper supplement to those of the sun and moon, which are before explained, and with which we concluded our article Orrery.

Table I.—The angular Distances of Mercury from the Aphelion and Perihelion Points, which correspond to exact Degrees of Equation.

Ang. Dist.		Equation.		Ang. Dist.		Equation.	
Aphelion		0°	0′	Perihelion		0°	0′
3°	3′.1	1	0	1°	49′.1	1	0
6	7.7	2	0	3	38.4	2	0
9	12.3	3	0	5	28.2	3	0
12	17.6	4	0	7	18.8	4	0
15	24.1	5	0	9	10.4	5	0
18	31.5	6	0	11	3.4	6	0
21	38.5	7	0	12	58.0	7	0
24	51.6	8	0	14	56.7	8	0
28	8.7	9	0	16	54.0	9	0
31	23.1	10	0	18	56.1	10	0
34	40.6	11	0	21	15.8	11	0

PLANETARY, fomething that relates to the planets. In this fenfe we fay, planetary worlds, planetary inhabitants, &c. Huygens and Fontenelle bring feveral probable arguments for the reality of planetary worlds, and animals, plants, men, &c. The former in his Κοσμοθεωρος, five de Terris Cœleftibus; the latter in his Dialogues, fur le Pluralité des Mondes.

PLANETARY *Hours*, in *Chronology*. See HOUR.

PLANETARY *Days*. Among the ancients, the week was fhared among the feven planets, each planet having its day. This we learn from Dion Caffius; and Plutarch, Sympof. lib. iv. q. 7. Herodotus adds, that they were Egyptians who firft difcovered what god, that is, what planet, prefides over each day; becaufe among this people the planets were directors. And hence it is, that, in moft European languages, the days of the week are ftill denominated from the planets; Sunday, Monday, &c.

PLANETARY *Years*, the periods of time in which the feveral planets make their revolutions round the fun, or earth.

As from the proper revolution of the fun, the folar year takes its original; fo from the proper revolutions of the reft of the planets about the earth, fo many forts of years do arife, *viz.* the Saturnian year, the Jovial year, the Martial year. For Venus and Mercury, as their years, when judged of with regard to the earth, are almoft equal to the folar year; they are more ufually eftimated from the fun, the true centre of their motions. See periodic times under PLANETS, *fupra*; and YEAR.

PLANETARY *Machines, an Hiftorical Account of.*—"The apparent motions of the heavenly bodies," fays profeffor Vince, "are the moft obvious phenomena in nature; and as a knowledge of the return of the feafons muft always have been neceffary for the hufbandman, the courfe of the fun probably engaged the attention of mankind in the early ages of the world." Accordingly the Jewifh hiftorian, Jofephus, Josephus, tells us, that the sons of Seth applied themselves to the study of astronomy, and engraved their observations on pillars of stone to survive the deluge; and that Abraham read lectures on astronomy to the Egyptians. Berosus, the Chaldean author, also says, that Providence prolonged the life of the antediluvians, on purpose that they might improve in virtue, and in the knowledge of geometry and astronomy, which were deemed essential to human welfare. Indeed, if we search into the history of the Chinese, Brahmins, Chaldeans, or Egyptians, we find that astronomy was cultivated by each of these nations soon after the dispersion of the human race and confusion of tongues. So much it seemed necessary to premise on the antiquity of astronomy itself, before we entered upon a detail of the different machines which have been constructed to represent the different systems which prevailed at the time of their construction; and, indeed, the histories of astronomy, and of astronomical instruments, are so intimately united, that they cannot be separated, but throw mutual light on each other.

To ascertain the date and particulars of the *first* machine which was invented for representing the motions of the heavenly bodies, is the province of the antiquarian, rather than of the cultivator of science; but as the order of *time* seems to be the most systematic to adopt in a regular description of different celestial machinery, it shall be observed, as far as the materials that we have collected will furnish an historical sketch.

The first celestial mechanism of which we have met with any intimation, is the Chinese sphere, mentioned by professor Vince in his excellent Treatise on Astronomy (vol. ii. p. 253.), which was made by Yu-chi, in the reign of the emperor Hoang-ti, in the year before Christ 2697, and which is described as having had many both moveable and fixed circles belonging to it; but with respect to further particulars, we are not in possession of any information.

The next machine that occurs is also a Chinese sphere, mentioned by Martin, in his History of China, as being made by a man of the name of Xuni, 2400 years before Christ. His words are these; "Xuni, 2400 ans avant J. C. fit faire une sphere d'or, enrichie de pierreries, ou l'on voyoit les sept planetes, et la terre au milieu:" *i. e.* "Xuni, 2400 years before Jesus Christ, had a sphere made of gold, enriched with precious stones, in which were to be seen the seven planets, and the earth in the middle." This short notice informs us what the system of the early Chinese astronomy was, and exactly accords with the account we have of the astronomical system of the Brahmins, who not only supposed the earth to be the centre of the planetary orbits, but also believed that it was placed on a mountain of gold, to which probably the golden sphere had some reference.

A third Chinese sphere is mentioned by Dr. Long in his Astronomy, vol. ii. p. 662, as having been made 2277 years before the Christian era by Chun, who, on succeeding Yao, found a great quantity of gold and jewels, of which he made a sphere that included the seven planets.

The contriver of this machine must have had the advantage of the astronomical determinations of the astronomers Hi and Ho, who about the year before Christ 2332, amongst other astronomical notices, determined that *one* year should consist of 366 days, and *three* of each 365, alternately. It will probably be said, that the emperor might have made a better use of his newly found treasure than in converting it into a sphere, but perhaps he had the circumstance in his recollection, that 2513 years before Christ, or 181 years before that time, Chueni was created emperor of China entirely on account of having calculated an ephemeris of the motions of five planets.

We do not meet with any mention made of instruments constructed by the Chaldeans or Egyptians for representing their system of astronomy, though they cultivated astronomy very early, nor does it appear quite certain what their system was. According to the authority of Macrobius, the ancient Egyptians made the planets revolve about the earth, and reckoned the sun to be a planet, with Mercury and Venus revolving as secondaries round him; and Diodorus Siculus says, the ancient Egyptians discovered that the planets (superior as well as inferior) had sometimes a direct, and sometimes a retrograde motion, and that they were sometimes stationary. He also asserts, that they made the sun move in a circle inclined to the equator, and in a direction contrary to the diurnal motion. These accounts favour the idea, that systems, somewhat different, were adopted, either at the same time, or successively; but that a system with the earth in the centre was the prevalent one, particularly among the later Egyptians, may be thus inferred. The Alexandrian school, we believe, is universally allowed to have given the names of the planets to the days of the week, which names are yet retained in the Latin language. Philander, in his learned notes to Vitruvius, has given us two reasons for the *order* Dies Saturni, Solis, Lunæ, Martis, Mercurii, Jovis, Veneris, *viz.* Saturday, Sunday, Monday, Tuesday, &c. This arrangement may have puzzled many of our readers who have considered it, and who probably have not been able to find out the reason of such a succession. The first reason, says Philander, is said, in the seventeenth book of Dion, to be this: "Cum existimarent Egyptii, planetarum eum esse ordinem, ut orbis summus Saturni diceretur, proximus Jovis, tertius Martis, quartus Solis, quintus Veneris, sextus Mercurii, septimus Lunæ; diatessaron harmoniæ rationem habentes, quod in eâ vis omnis musica contineretur, orbium tetrachorda septem commenti sunt, quorum singulas primas stellas singulis hebdomadis diebus assignarent. Primum tetrachordum a Saturno ad Solem concipiebant, secundum a Sole ad Lunam, tertium a Luna ad Martem, quartum a Marte ad Mercurium, quintum a Mercurio ad Jovem, sextum a Jove ad Venerem. Inde factum, ut primus dies sit appellatus Saturni, quia primi tetrachordi princeps erat Saturnus, et pari ratione secundus Solis, tertius Lunæ, quartus Martis, quintus Mercurii, sextus Jovis, et septimus Veneris:"—that is,—"As the Egyptians thought the order of the planets to be such, that the orbit of Saturn was called the highest, that of Jupiter the next, that of Mars the third, that of the sun the fourth, that of Venus the fifth, that of Mercury the sixth, and that of the moon the seventh; conceiving a certain harmonic ratio to run by *fours*, as the groundwork of music, they made seven tetrachords (as they called them) of the orbits, and assigned the first planet of each (tetrachord or space of *four* successively) to each day of the week. Thus they imagined the first tetrachord to reach from Saturn (the highest) down to the sun, the second from the sun down to the moon, the third from the moon round again to Mars, the fourth from Mars down to Mercury, the fifth from Mercury round a third time to Jupiter, and the sixth from Jupiter down to Venus. Hence it came to pass, that the first day was called Saturday, or day of Saturn; the second Sunday, or day of the sun; the third Monday, or day of the moon; the fourth (or Tuesday) the day of Mars; the fifth (or Wednesday) the day of Mercury; the sixth (or Thursday) the day of Jupiter; and seventh (or Friday) the day of Venus."

The

The other reaſon of this order of the planetary names of the ſeven days, as given by Johannes Oxiphilinus, was this: "Cum naturalis dies quatuor et viginti horis conſtaret, primam dabant Saturno, ſecundam Jovi, tertiam Marti, quartam Soli, quintam Veneri, ſextam Mercurio, ſeptimam Lunæ; rurſus octavam Saturno, nonam Jovi, ac deinceps ad viceſimam quartam, quæ Martis cum eſſet, contingebat, ut proximæ diei prima eſſet Solis, tertiæ Lunæ, quartæ Martis, quintæ Mercurii, ſextæ Jovis, et ſeptimæ Veneris. Ex eo diebus hebdomadis planetarum inditum eſt præſidium, quos memorato ratiocinio primis horis præeſſe contigerat. Quem morem receperunt longo poſt tempore, & non ita pridem, Græci & Romani. Et revera, ut legas omnia omnium antiquorum monumenta, nunquam reperias eam dierum appellationem."—Namely: "As a natural day conſiſts of 24 hours, they gave the firſt to Saturn, the ſecond to Jupiter, the third to Mars, the fourth to the Sun, the fifth to Venus, the ſixth to Mercury, and the ſeventh to the Moon; again the eighth to Saturn, the ninth to Jupiter, and ſo on till the twenty-fourth, which happening to fall to Mars, made the ſun the firſt of the next day, the moon the firſt of the third day, Mars of the fourth, Mercury of the fifth, Jupiter of the ſixth, and Venus of the ſeventh. Hence thoſe planets to which the firſt hour of each day fell, by this mode of counting, were made to preſide over thoſe particular days: which mode the Greeks and Romans did not adopt till a long time afterwards, indeed not till recently: and in tracing the inſcriptions of the ancients this manner of naming the days is not to be met with."

Thus have we two reaſons given for the origin of the ſame cuſtom, of equal authority and probability; both of which may be eaſily underſtood if we deſcribe a circle and divide it into ſeven equal portions, and mark them ſucceſſively with the characters ♄ ♃ ♂ ☉ ♀ ☿ ☾; for the extent from ♄ to ☉ will make the points of a pair of dividers fall ſucceſſively thus, ♄ ☉ ☾ ♂ ☿ ♃ ♀, which are in the ſame order of ſucceſſion, as the days of the week which they reſpectively repreſent; alſo if, according to the ſecond reaſon given, we begin with ♄ and count to 24, the firſt of the next 24 will be ☉, and of the next 24 ☾, and ſo of the reſt.

Whichever of theſe reaſons was the original one for thus deſignating the days of the week, it is equally evident *what* the Egyptian ſyſtem was at the period this aſtronomical nomenclature was aſſigned; the earth was evidently placed in the centre, and the ſun was conſidered as a planet revolving round it in a year; and it is worthy of remark that Saturday, which was the Jewiſh ſabbath, was made the firſt inſtead of the ſeventh day of the Egyptian week.

Perhaps we ſhall be pardoned the ſhort digreſſion, if we ſhould remark here, that a natural and eaſy ſolution preſents itſelf, from a conſideration of the Chaldæan and Egyptian ſyſtem of aſtronomy, of the difficulty of thoſe paſſages of ſcripture, which relate to the motion of the ſun, and which have been uſed to countenance the cavils of ſome of our modern Deiſts: in Joſhua, chap. x. verſes 12, 13, it is ſaid that the ſun and moon ſtood ſtill for the ſpace of a whole day; and in the prophet Iſaiah, chap. xxxviii. v. 8. it is ſaid, that in order that the ſhadow might go back on the dial of Ahaz, "the ſun turned ten degrees backward, by which degrees it was gone down;" and again in the ſecond book of Kings we read, chap. xx. v. 11. the Lord "brought the ſhadow ten degrees backward, by which it had gone down in the dial of Ahaz." The objection to theſe paſſages has been that they attributed a motion to the ſun which is not agreeable to the true ſolar or Copernican ſyſtem, as now unqueſtionably eſtabliſhed; the anſwer to which, and in our opinion a complete anſwer, ariſes out of the ſyſtem at preſent before us: which is this, that at the time when theſe paſſages were written, the prevailing ſyſtem was, that the ſun actually moved as the fourth or middle planet, once round the earth as its centre, from weſt to eaſt in a year, and alſo, in common with all the other planets, moved along with their primum mobile once round from eaſt to weſt in 24 hours: if, therefore, ſcripture had ſaid that to produce the effect in queſtion, "the rotation of the earth on its axis was ſuſpended for a day," or that "the earth turned backward on its axis ten degrees," ſuch language would have been *unintelligible* to the people of that remote age, who knew not that the earth was a planet, nor yet that ſhe has a rotation on her axis, to produce the changes of day and night; the expreſſions, conſequently, in this, as in all other inſtances that we known of, were ſuited to the *apprehenſions* of the people to whom they were addreſſed, and were on that account ſufficiently expreſſive of the magnitude of the miracles which were performed by divine agency, for purpoſes of importance ſufficient to juſtify our credence of the facts related.

If it ſhould be here objected, that in one of the paſſages quoted, it is ſaid that the *ſhadow* went back *ten degrees*, and that in another of them it is ſaid, the *ſun* went back *ten degrees*, whereas in dials in general the degrees on the face do not correſpond in each hour, nor indeed in any hour, to the degrees of the ſun's apparent motion in the heavens, our further anſwer is, that in equinoctial dials, which were the earlieſt, as well as moſt ſimple, and the eaſieſt to make, the degrees on the dial-plate do exactly accord in number with the degrees of the ecliptic; until, therefore, it has been ſhewn, that the dial of Ahaz was not an equinoctial dial, the objection will not apply: on the contrary, there are other reaſons beſides the above for ſuppoſing that it was an equinoctial dial, one of which will ſuffice to mention, which is this: when Vitruvius is ſpeaking (chap. iv.) of the origin of ſun-dials, he ſays, "Ea autem ſunt divina mente comparata, habentque admirationem magnam, conſiderantibus, quod umbra gnomonis æquinoctialis alia magnitudine eſt Athenis, alia Alexandriæ, alia Romæ, non eadem Placentiæ, cæteriſque orbis terrarum locis."——"Theſe things are comprehended by minds which are as it were divine, and afford much admiration to thoſe who conſider them, becauſe the ſhadow of an *equinoctial gnomon* is different in length at Athens, at Alexandria, at Rome, at Placentia, and at other parts of the world." This extract ſerves to ſhew that the equinoctial dial was generally known in Egypt, Greece, Rome, and other parts of the globe before the time of the Romans. It was, indeed, an attentive obſervation and meaſurement of the length of the ſhadow compared with the height of the gnomon of a dial, which led to a knowledge, amongſt other things, of the obliquity of the ecliptic with reſpect to the equator, in very early ages; and it is by comparing more modern obſervations on the ſun's place, when croſſing the equator, with ancient determinations effected in this manner, that later aſtronomers have been enabled to determine not only the annual preceſſion, or rather retroceſſion of the equinoctial points, but have thereby very nearly aſcertained the period in which ſome of the ancient aſtronomers flouriſhed, and alſo the authenticity of many hiſtorical facts.

From Egypt, it is generally underſtood, that Thales of Miletus firſt introduced a knowledge of the circles of the ſphere, and the cauſes of ſolar and lunar eclipſes into Greece, about ſix centuries before the Chriſtian era, and that he calculated

culated an eclipse, probably from the assistance of the *Chaldean Saros*, which was a period of 223 lunations, or 6585⅓ days for the revolution of the nodes, from which a lunation was determined to be $29^d\ 12^h\ 44^m\ 7''$, which is only about $4''$ above the period that our best tables are calculated from.

Very soon after this time Anaximander, the scholar of Thales, who died in 547 A. C., taught that the earth was a sphere placed in the centre of the world, and that the moon borrows her light from the sun. Pliny says that he first discovered the obliquity of the ecliptic, but this must be a mistake, as we have before seen, that it was known to the Egyptians, unless, indeed, we discredit the authority of Diodorus Siculus; the invention of the sun-dial has also been attributed to him, but this is equally doubtful: he might probably be the first who made one in Greece.

A short time after Anaximander, Pythagoras of Samos became famous for his knowledge of astronomy, which he gained from the priests in Egypt; it is generally said that he placed the sun in the centre of the system, and laid the foundation of the Copernican system, but Laertius affirms that the system he held was, " that the earth was in the centre, with a diurnal motion, in the next place the moon, then the sun, and then the orbits of the planets." His disciple, however, Philolaus of Crotona, about the year 450 B. C. placed the sun in the centre, with the earth and other planets revolving round him; and soon afterwards Hicetas of Syracuse gave the earth a diurnal motion; and Plutarch says, that Pythagoras in his old age repented that he had not given to the earth its proper place. We might mention other names of men who contributed to the advancement of astronomy, if it did not interfere too much with our plan; but we must not omit to mention here Eudoxus of Cnidos, who was a scholar of Plato, and who, about 360 years B. C., made not only a sun-dial, but also a sphere or globe, with the constellations marked on it, as Chiron the centaur is said by fabulous history to have done before. According to Seneca, it was he who brought the hypothesis of the motions of the five planets out of Egypt into Greece.

About 300 years before Christ, Euclid of Alexandria wrote his admired treatise on geometry, which paved the way for astronomical calculations; and about a century after him the celebrated Grecian mathematician Archimedes, not only wrote a description of the sphere, but actually constructed one, in which, it should seem from the account of the Roman poet Claudian, the sun, moon, and planets had their respective motions, which they were at that time supposed to have in the system of nature, and that the globe which surrounded these moving bodies was made of glass, and had the constellations depicted on its surface: and as Archimedes had invented an engine for raising great weights by wheelwork, there can be no doubt but that wheels and pinions were introduced in his sphere to produce the respective motions. The description alluded to is this; *viz.*

" Jupiter in parvo cum cerneret æthera vitro,
Risit, et ad superos talia dicta dedit:
Huccine mortalis progressa potentia curæ!
Jam meus in fragili luditur orbe labor.
Jura poli, rerumque fidem, leges que Deorum
Ecce Syracusius transtulit arte senex.
Inclusus variis famulatur spiritus astris,
Et vivum certis motibus urget opus.
Percurrit proprium mentitus signifer annum,
Et simulata novo Cinthia mense redit:
Jamque, suum volvens audax industria mundum,
Gaudet, & humanâ sidera mente regit.
Quid falso insontem tonitru Salmonea miror?
Emula naturæ parvo reperta manus."

Epig. in Sphær. Archimedis.

As the translation which Dr. Derham has annexed to this quotation is not remarkable for its elegance, we beg leave to substitute the following:

" When Jove beheld in glass his heaven made,
He laugh'd, and to the deities thus said:
That human power and art should so succeed
With brittle orb, to imitate my deed!
Behold! that aged Syracusan's skill
Has made the very skies obey his will.
An hidden spirit guides, by certain laws,
Each animated planet as it goes.
The sun, well feign'd, his annual circuit makes;
And Cynthia too her monthly journey takes:
Man now by industry too bold is grown,
With joy who dares to make the world his own.
Why wonder at Salmoneus' dreadful lot?
Since nature's artist has a rival got."

The poet could not better express his admiration of the mechanism in question, than by supposing Jupiter more enraged at the sight of it, than he was at the king of Elis, who imitated his thunder by driving a chariot over a brazen bridge, and by throwing down burning torches at the same time instead of lightning; for which presumption, the story is, that he was hurled headlong by a thunderbolt into the infernal regions: but when we consider that the "hidden spirit" which actuated the various motions was probably a *dead weight*, his incensed majesty had not much reason to be jealous in either instance. Besides the above authentic account of the sphere of Archimedes, we have the two following notices of the Roman orator Cicero; the first is in the Tusculan Questions, where, as an argument to prove the divine nature of the soul (lib. i.) he introduces the contrivance of Archimedes thus: " Nam cum Archimedes lunæ, solis, quinque errantium motus in sphæram illigavit, effecit idem, quod ille, qui in Timæo mundum ædificavit Platonis deus, ut tarditate, et celeritate dissimillimos motus una regeret conversio. Quod si in hoc mundo fieri sine deo non potest, ne in sphæra quidem eosdem motus Archimedes sine divino ingenio potuisset imitari." In English thus; " For when Archimedes connected together in his sphere the motions of the moon, sun, and five wandering stars, he effected the same thing which that god did in Timæus, who built Plato's world in such a manner, that one revolution of it produced motions very dissimilar in slowness and quickness. But if this thing cannot be effected in that world without the aid of a god, neither could Archimedes in his sphere imitate similar motions without a divine genius." And again, in his second book " de Natura Deorum," Tully says, when speaking of the philosophers of his age, " Archimedem arbitrantur plus valuisse in imitandis sphæræ conversionibus, quam naturam in efficiendis," *i. e.* they imagined that " Archimedes could better imitate the motions of the sphere than nature could keep them in motion." Such was their veneration of that great philosopher and mechanic.

If we pass over sun-dials which were constructed in very early ages, and clepsydræ or water-clocks, (the invention of which has been attributed by Pliny to P. Cornelius Nasica, 150 years before Christ, but by Vitruvius to Ctesi-

 bius

bius about the ſame time,) we find no machine or inſtrument repreſenting the motions, or meaſuring the periods, of any of the heavenly bodies, till nearly eighty years before the Chriſtian era, when Poſidonius made a ſphere which ſeems to have been ſimilar to that of Archimedes. Cicero's deſcription of it, in his ſecond book "de Natura Deorum," is this; "Quod ſi in Scythiam, aut in Britanniam, ſphæram aliquis tulerit hanc, quam nuper familiaris noſter effecit Poſidonius cujus ſingulæ converſiones idem efficiunt in ſole, & in luna, & in quinque ſtellis errantibus quod efficitur in cœlo ſingulis diebus & noctibus; quis in illâ barbarie dubitet, quin ea ſphæra ſit perfecta ratione?" In Engliſh thus; "If any one ſhould convey into Scythia or into Britain this ſphere which our friend Poſidonius lately conſtructed, the revolutions of which produce the ſame effect in the ſun, moon, and five planets, as they experience in heaven; who is there in the midſt of ſuch barbarity, who could doubt that this ſphere is perfected by the operation of reaſon?"

It is the opinion of Ferdinand Berthoud, a French author, who has written many books on the different branches of clock-work, that this ſphere, like that of Archimedes, had wheels and pinions, but that it was put in motion by a water-clock, which kept it going day and night; and to reſcue our own country from the imputation of *barbarous ignorance* at the age in queſtion, it is grateful to the feelings of an Engliſhman to be told, by the ſame author, ſpeaking of clepſydræ, (Hiſtoire de la Méſure du Tems, tome i. p. 20, 21.) that "Ceſar les trouva même en Angleterre, lorſqu'il y porta ſes armes. Cet inſtrument nouveau lui donna lieu d'obſerver que les nuits de ce climat etoient plus courtes que celles d Italie:" *i. e.* "Cæſar found them, even in England, when he carried his arms thither. That *new* inſtrument gave him an opportunity of obſerving that the nights of that climate were ſhorter than thoſe of Italy." It muſt have been in ſummer that this obſervation was made by Cæſar, otherwiſe the reſult would have been juſt the reverſe.

Beſides the ſpheres above named, Dr. Derham ſays that Cardan mentions another belonging to Sapor, king of Perſia, in the middle of which his majeſty could ſit, and ſee all the ſtars riſe and ſet, though it was made of glaſs; but whether this was the ſame Sapor who was contemporary with Conſtantine the Great, is uncertain; nor is it known what wheelwork or planetary motions belonged to it, nor yet what ſyſtem of aſtronomy was the groundwork of the calculations, if there were any.

What the ſyſtem of the Romans was may be collected from their writings, particularly thoſe of Vitruvius and Tully in his dream of Scipio. The former deſcribes it very minutely in theſe words; (de Architectura, lib. ix. cap. 4.) *viz.* "Signa cum ſint numero xii, partes que duodecimas ſingula poſſideant mundi, verſentur que ab oriente ad occidentem continentèr, tunc per ea ſigna contrario curſu Luna, ſtella Mercurii, Veneris, ipſe Sol, item que Martis, et Jovis, et Saturni; ut per gradunm aſcenſionem percurrentes, alius aliâ circuitionis magnitudine ab occidente ad orientem in mundo pervagantur. * * * Mercurii autem et Veneris ſtellæ, circum ſolis radios, ſolem ipſum, uti centrum, itineribus coronantes, regreſſus retrorſum et retardationes faciunt."

"There are twelve ſigns, occupying each a twelfth part of a circle of the world, and turning round continually from eaſt to weſt; then through theſe ſigns, in a contrary direction, run the Moon, Mercury, Venus, the Sun, Mars, Jupiter, and Saturn, moving, as it were, along an aſcent of ſteps, each in an orbit of a different ſize from weſt to eaſt. * * * But Mercury and Venus moving round the rays of the ſun, and conſidering the ſun himſelf as their centre, make retrograde motions, and experience a diminution of velocity."

Tully's account, which is in a more ornamental ſtyle, runs thus (M. Tul. Cic. Somnium Sciponis): "Extimus (orbis) qui reliquos omnes complectitur, ſummus ipſe Deus, arcens et continens cæteros; in quo infixi ſunt illi, qui volvuntur, ſtellarum curſus ſempiterni; cui ſubjecti ſunt ſeptem, qui verſantur retrò, contrario motu, atque cœlum, ex quibus unum globum poſſidet illa, quam in terris Saturniam nominant. Deinde eſt hominum generi proſperus et ſalutaris ille fulgor, qui dicitur Jovis: tum rutilus horribilis que terris, quem Martium dicitis: deinde ſubter medium fere regionem Sol obtinet, dux et princeps, et moderator luminum reliquorum, mens mundi, et temperatio, tantâ magnitudine, ut cuncta ſuà luce illuſtret et compleat. Hunc ut comites conſequuntur alter Veneris, alter Mercurii curſus; in infimo que orbe luna, radiis ſolis accenſa, convertitur. Infra autem jam nihil eſt, niſi mortale et caducum, præter animos generi hominum munere deorum datos. Supra lunam ſunt æterna omnia. Nam ea, quæ eſt media et nona, tellus, neque movetur, et infima eſt, et in eam feruntur omnia ſuo nutu pondera."

"The outermoſt (orb) which ſurrounds all the reſt, is the great God, impelling and holding together all the reſt; within which (orb) the eternal courſes of the ſtars, which roll along, are fixed; under this are ſeven others carried backwards by a motion, contrary to that of heaven, one of which has a globe, called on earth Saturnia. Next is that luminary which is propitious and ſalutary to man, called Jupiter: then that ruddy and horrible one, which is denominated from Mars; after that, and nearly in the middle region, is the ſun, the prince and guide, as well as ruler of all the other luminaries, the mind and regulating power of the world, of ſuch magnitude as to illuminate and fill all places. The courſes (or orbits) of Venus and Mercury follow him as his companions; and the moon, lighted by the rays of the ſun, is carried round in the loweſt orb. Below her is nothing but what is mortal and frail, except the minds of men, which are the gift of the gods. Above the moon all things are eternal. For this Earth, which is the middle (or centre), and the ninth in order, does not move, and is the loweſt; and towards it are voluntarily carried all ponderable bodies."

We could produce further accounts of this ſyſtem from Pliny, Martianus Capella, and Caſſiodorus, if more were deemed neceſſary for our purpoſe; but we have perhaps already dwelt too long upon the accounts of heathen authors to be conſiſtent with our plan, of giving only a hiſtory of planetary machines; we will therefore ſubjoin only one further remark with reſpect to theſe authors and their ſyſtem, which is, that many of our words, particularly epithets, are evidently taken from this order of the planets, and owe their original ſignification to it; ſuch are the words *ſupernal*, *infernal*, *ſuperiòr*, *inferior*, *ſublunary*, *ſolſtice*, *ſun's path*, *aſcenſion*, *deſcenſion*, *declination*, and others which we ſtill retain, notwithſtanding we have placed the ſun in the centre, and made the earth a planet to deſcribe the ſame orbit which was formerly attributed to him.

It being then probable, that, as the ancient Egyptian was the prevailing ſyſtem on the continent before and for ſome time after the Chriſtian era, the machines which were invented before and about that memorable period, were contrived to exhibit *diurnal*, as well as contrary *annual* revolutions

tions of all the planets, except of Mercury and Venus, which planets were made to revolve as fecondaries to the fun, or fecond planet in order from the centre; the moon being the firft: fuch a fyftem would exhibit the phenomena relating to the fun, Mercury, Venus, and moon very well, but would not give a reprefentation of the retrogradations of our fuperior planets.

Ptolemy, who died about 138 years after the commencement of the Chriftian reckoning, faw the difficulty of explaining the retrogradations of the fuperior planets by the Alexandrian fyftem, and therefore devifed the circles and epicycles that diftinguifh his fyftem, in order to account for the apparent irregularities of the planetary motions; and though he probably could not conftruct a machine to reprefent the faid motions exactly, yet in his Almageft is defcribed a fphere, with the conftellations depicted thereon, to which he could refer the apparent paths of the heavenly bodies, and by which he could explain his fyftem.

From the time of Ptolemy to the fixteenth century, in which Copernicus revived the fyftem of Philolaus, or as is generally faid of Pythagoras, the machines which were conftructed we muft fuppofe reprefented the Ptolemaic fyftem, which, like the Egyptian, placed the earth in the centre, but fuppofed the moon and planets all feparately revolving round it every day, whilft they flowly performed periodic cycles and epicycles, to account for the ftationary and retrograde appearances, that could not otherwife be explained. The moft ancient machine of which we have met with any account during this period is that of Chromatius, the governor of Rome, in the third century, which is mentioned in the firft volume of Beckmann's "Hiftory of Inventions and Difcoveries." According to the accounts of St. Sebaftian and St. Polycarp, this coftly piece of mechanifm confifted of a pavilion of glafs, in the conftruction of which were confumed two hundred pounds weight of gold, as materials for the workmanfhip; and all the heavenly bodies were reprefented by mechanifm, together with the change of the phafes of the moon: there appears to have been alfo an ecliptic circle divided into figns. But whatever the particular conftruction of this machine may have been, it was loft to pofterity by the violent hands which the faints laid upon it, either on account of the valuable materials of which it was conftructed, or by reafon of fome fuppofed *impiety* attached to fuch a reprefentation of the heavens. St. Sebaftian reprefents Chromatius as fpeaking thus; "Habeo cubiculum holovitreum, in quo omnis difciplina ftellarum ac mathefis mechanicâ eft arte conftructa in cujus fabricâ pater meus Tarquinius amplius quam ducenta pondo auri dignofcitur expendiffe," *i. e.* "I have a chamber of glafs, in which all the knowledge relating to the ftars is laid down by mechanical contrivance, in the conftruction of which my father Tarquin is known to have confumed more than two hundred pounds weight of gold:" to which St. Sebaftian anfwers, "Si hoc tu integrum habere volueris teipfum frangis," *i. e.* "if you wifh to preferve this entire, you ruin yourfelf;" to which Chromatius replies, "Quid enim? mathefis aut ephemeris aliquo facrificiorum ufu coluntur, cum tantum eis menfium et annorum curfus certo numero per horarum fpatia diftinguuntur? Et lunaris globi plenitudo, vel diminutio, digitorum motu, rationis magifterio, et calculi computatione prævidetur?" (Act. Sanc. Seb. cap. 16.) *i. e.* "But why? this knowledge of the daily motions, is it not ufeful for the obfervance of the facred rites, feeing that the lapfe of months and of years is diftinguifhed by the paffage of a certain number of hours? And are not the increafe and decreafe of the lunar globe forefeen by the motion of indexes, guided according to certain calculations?" St. Polycarp, fpeaking of the fame mechanifm, ufes thefe words; "Illic figna Leonis, et Capricorni, et Sagittarii, et Scorpionis, et Tauri funt; illic in Ariete Luna, in Cancro hora, in Jove ftella, in Mercurio tropica, in Venere Mars, et in omnibus iftis monftruofis dæmonibus ars deo inimica cognofcitur:" that is, "There are the figns of Leo and of Capricorn, of Sagittarius and of Scorpio, and of Taurus; there are the moon in Aries, the hour-hand in Cancer, a ftar in Jupiter, the tropic in Mercury, in (or with) Venus Mars; and in all thofe monftrous dæmons is difcovered an art hoftile to the Deity."

The next inftrument in the order of time which occurs in our refearch, is that which was contrived by Y-tang, the celebrated Chinefe aftronomer, in the year 721, and which merited the admiration of his contemporaries. Berthoud (tome i. p. 38, and tome ii. p. 178, 179, Hiftoire de la Méfure,) fpeaks of this inftrument in the words of father Gaubil, thus: "L'eau faifoit mouvoir pleufieurs roues; et par leur moyen, ou reprefentoit le mouvement propre, et le mouvement commun du foleil, de la lune, et des cinque planetes; les conjonctions, les oppofitions, les éclipfes du foleil et de la lune; les occultations des etoiles et des autres planetes."—Which account in Englifh may be thus; "Many wheels were put in motion by water, and by their means were reprefented both the proper and common motions of the fun, moon, and five planets; the conjunctions and oppofitions, the eclipfes of the fun and moon, and occultations of the ftars, as well as of the planets."—By the proper and common motions, we conceive, we muft underftand the apparent or fuppofed diurnal motion of the planets round the earth, as well as their progreffive motions in the ecliptic, and alfo the lunation and motion of the moon's nodes. For it is faid, moreover, that this inftrument exhibited, by two pointers, the *hours* of the day and night, and alfo the *ke*, or hundredth part of the Chinefe day; and it may be worthy of remark here, that at every return of the index to the *ke* a little wooden ftatue ftept forth, and gave a blow on a wooden board, and then retired; which probably was the origin of *ftriking* clocks; but what was the regulator of this early horological, as well as aftronomical machine, does not appear.

We muft now pafs on to the eleventh century, in which William, the learned abbot of Hirfham, is faid "to have invented a natural horologe in imitation of the celeftial hemifphere;" (naturale horologium ad exemplum cœleftis hæmifpherii excogitâffe;) but this fhort notice conveys no exact idea of the conftruction of this piece of mechanifm.

The next machine that we find defcribed is an *horologium*, which, Trithemius fays, was prefented to the emperor Frederic II., of Germany, by one of the fultans of Egypt, in the year 1232: his defcription is as follows. "Saladinus Egyptiorum Frederico Imperatori dono mifit per fuos oratores tentorium pretiofum, mirabili arte compofitum, cujus pretii æftimatio quinque ducatorum millium procul valorum exceffit. Nam ad fimilitudinem fphærarum cœleftium intrinficus videbatur conftructum, in quo imagines folis, lunæ, ac reliquorum planetarum artificiofiffimè compofitæ movebantur ponderibus et rotis incitatæ; ita videlicet, quod, curfum fuum artis ac debitis fpatiis peragentes, horas tam noctis quam diei infallibili demonftratione defignabant; imagines quoque xii fignorum zodiaci certis diftinctionibus fuis motæ cum firmamento curfum in fe planetarum continebant."—"The fultan of Egypt prefented to the emperor Frederic, by his orators, a valuable tent (or pavilion), conftructed with admirable art, the value of which has been eftimated at more than five thoufand ducats. For its appearance within reprefented the celeftial fpheres, in which were the reprefentatives ſentatives of the ſun, moon, and the reſt of the planets, moſt ingeniouſly made and actuated by means of wheels and weights; ſo that, performing their courſes in certain ſtated periods, they deſignated the hours both of night and day with infallible clearneſs; the ſhapes alſo of the twelve ſigns of the zodiac diſtinctly moving along with the firmament, contained upon them the paths of the planets." Here it may be obſerved the ſun and moon are reckoned among the primary planets, according to the Ptolemaic ſyſtem: and if this horologium was an aſtronomical clock going by wheel-work, by the power of an appended weight, we think it may be conſidered as the firſt of which we have had any deſcription handed down to us: we are at a loſs, however, to know what was the *regulator*, if it had any; and alſo whether the *time* indicated was really *contemporary* with the earth's motion on its axis, (their ſuppoſed diurnal motion of the ſun,) or only a nominal or *relative* time, many days of which might paſs in a ſhort period, when the machine was in quick uncontrolled motion.

Next in order comes an aſtronomical machine or clock, made by Richard of Walingford, abbot of St. Alban's, in the fourteenth century, which was called Albion (all by one). Leland ſpeaks of the inventor and inſtrument thus: *viz.* "Electus in monaſterii præſidem —— cum jam per amplas licebat fortunas, voluit illuſtri aliquo opere non modo ingenii, verum etiam eruditionis ac artis excellentis miraculum oſtendére. Ergo talem horologii fabricam magno labore, majore ſumptu, arte vero maximâ compegit, qualem non habet tota, meâ opinione, Europa ſecundam; ſive quis curſum ſolis ac lunæ, ſeu fixa ſidera notet, ſive iterum maris incrementa et decrementa, ſeu lineas una cum figuris ac demonſtrationibus ad infinitum pene variis conſideret."—"After being elected abbot, now that his fortune would permit, he wiſhed to give proof, by ſome illuſtrious work, not only of his ingenuity, but of his learning alſo, and ſkill in the arts: he therefore conſtructed by great labour, and ſtill greater expence, with uncommon ſkill, ſuch a machine as, in my opinon, cannot be equalled in all Europe, whether you regard the courſe of the ſun and moon and fixed ſtars, or you take into conſideration the ebbing and flowing of the ſea, and the almoſt infinite variety of lines and geometrical demonſtrations." Nearly about the ſame time John, ſon of James Dondi, afterwards called Horologius, made a machine ſimilar to the foregoing, which is thus deſcribed by Petrus Paulus Vergerius. "In quo erat firmamentum & omnium planetarum ſphæræ, ut ſic ſiderum omnium motus, veluti in cœlo, comprehendantur; feſta edicta in dies monſtrat, plurima que alia oculis ſtupenda; tantaque fuit ejus horologii admiranda congeries, ut uſque modo poſt ejus relictam lucem corrigere, & pondera convenientia aſſignare ſciverit aſtrologus nemo. Verum de Franciâ nuper aſtrologus & fabricator magnus, fama horologii tanti ductus, Papiam venit, plurimis que diebus in rotas congregandas elaboravit; tandem que actum eſt, ut in unum, eo quo decebat ordine, compoſuerit, motum que ut decet dederit:" that is to ſay, this is a machine, "in which the firmament and ſpheres of all the planets, together with the motions of all the ſtars, are contained exactly as in heaven; it points out the feſtivals and other wonderful things; and ſo great and admirable was the ſtructure of this horologe, that after his (Dondi's) death, no aſtrologer could rectify, or aſſign the proper weights to the different parts. At length, however, an aſtrologer and famous mechanic of France, attracted by the report reſpecting ſuch an horologe, came to Pavia, and after many days labour collected the wheels, and put them into ſuch order, as to produce the requiſite motions."

The next inſtrument which we meet with is the famous aſtronomical clock at Straſburg, made in 1370, an account of which is given by Conradus Daſypodius in a German book, (Jac von Konigſhovens Elfaſs and Straſb.-Chronik, p. 574.) which we have not at preſent before us.

Again, John Werner of Nuremberg, that eminent aſtronomer and geometer, who firſt propoſed the lunar method of diſcovering the longitude, about the year 1500 employed Andrew Heirlin, an excellent mechanic, to conſtruct a machine which repreſented by wheelwork the Ptolemaic ſyſtem (Doppelmayer de Mathemat. Nurem.); but we are not in poſſeſſion of a more particular account of this machine.

Hitherto we have been able to collect only an hiſtorical ſketch of aſtronomical mechaniſm, as it is connected with the progreſs of aſtronomy, without knowing the preciſe diſpoſition of the parts, or the numbers into which the wheels were divided which produced the various motions; but imperfect as it is, it will furniſh us with a proof, that in all ages of the world, a repreſentation of the ſyſtem of the univerſe by mechaniſm has not only been deemed worthy of the efforts of the greateſt geniuſes, but has been conſidered as the moſt arduous and wonderful undertaking.

In coming down nearer to our own time, we propoſe to admit into our account notices of thoſe machines only, of which we can deſcribe ſome or all of the powers and properties from authentic ſources of information, and concerning which, therefore, we may be able to make appropriate remarks.

The firſt machines of modern conſtruction that offer themſelves to our notice, are the planetary clocks of the late Mr. Peckitt, of Compton-ſtreet, London, and the turret clock at Hampton-Court, in both of which are ſolar and lunar trains of wheelwork; but we have already deſcribed thoſe under our article Clock, and the latter at conſiderable length; to which we therefore refer our readers for further information.

Next in order after theſe we may place the famous planetary clock invented by Oronce Finée, mathematician to the kings Francis I. and Henry II. of France, begun in 1553, and made, during the ſpace of ſeven years, by the beſt workmen that could be found: this machine was preſented to the cardinal du Lorraine, and is at preſent placed in the library "de Sainte Geneviéve," or Pantheon at Paris. The exterior ſhape of this machine is repreſented as a pentagonal column, ſeventeen inches diameter and ſix feet high, ſurmounted by a braſs celeſtial globe of ſeven inches diameter, which contains 48 conſtellations, and which revolves once in every 24 hours from eaſt to weſt. The interior part of this pillar contains upwards of one hundred wheels to give the reſpective motions to the ſun, moon, and planets, which are actuated by clockwork, and the whole are kept in their reſpective motions by one weight ſuſpended within the pillar, the fall of which is one foot *per* day, and the motions continue 48 hours and upwards. The movement of each planet conſiſts of twelve, ten, or eight wheels, as the neceſſary accuracy requires, and they are all made of Spaniſh ſteel and actuated by one common arbor. The deſcription of this elaborate inſtrument is contained in a printed *recueil*, N° $\frac{V}{68}$, of the library at the Pantheon, Paris, in which it is ſaid, that the increaſe and decreaſe of velocity is ſomehow effected by the mechaniſm in the motion of the heavenly bodies, which are repreſented, together with the excentricities and motions of the apogees, nodes, and latitudes of each. The five plain ſides of the pentagonal column have each a braſs face of two feet in length, and ten inches in breadth, in each of which are two circles, the upper and the lower, except in that

that containing the places of the ſun and moon, which has three circles; and hands or pointers are made to indicate the different motions on the reſpective d'or moulu dials or circles, which are appropriated according to the ſubjoined arrangement, *viz.*

Faces.—1. The motion of Saturn above, and of Jupiter below.

2. The motion of Mars above, and of Mercury below.

3. The motion of Venus above, and of the ſun below.

4. The motion of the moon above, and of the moon's node below.

5. The hours above, an aſtrolabe below, and in the middle the conjunctions, oppoſitions, eclipſes, &c. of the ſun and moon.

The wheelwork and other mechanical parts of the inſtrument are not contained in Berthoud's extract, whence this detail is abridged; but the times of the various revolutions attributed to the movements, and alſo to the celeſtial bodies themſelves, which are ſaid to be repreſented to a minute in a revolution, are given in the ſubjoined table.

Planets.	Whole Periods. D. H. M. S.	Motion in 24*h*.
Mercury -	87 23 15 36	0 59 8

Ditto nodes -	19 years	

This machine does not exhibit to the eye the repreſentatives of the planets in their orders and diſtances, but only indicates on the different faces the periods of their ſidereal revolutions; the earth is conſidered by the inventor as the centre of the orbits of the Moon, Sun, Mars, Jupiter, and Saturn, the three laſt of which are made to move in the Ptolemaic epicycles; but the planet Sol, or ſun, is made the centre of the orbits of Mercury and Venus, according to the Egyptian ſyſtem, which is the reaſon why the daily progreſs in the ecliptic is put down for theſe three alike. It is ſomewhat remarkable, that this arrangement is not according to the Copernican ſyſtem, though Copernicus had publiſhed his book called the "Revolutions of the celeſtial Orbs," which laid the foundation of his ſyſtem, twelve years before; hence we muſt ſuppoſe, either that the book had not found its way from Pruſſia into France at that time, or elſe that the ſyſtem at firſt met with oppoſition. Thus an union of the Ptolemaic with the old Egyptian ſyſtem became the favourite of the aſtronomer before us, and three years afterwards he publiſhed a book in defence of this theory. This machine, then, ſtill in exiſtence, is a ſtanding proof of what has been aſſerted of the nature of the old original ſyſtem deſcribed by Vitruvius and Cicero, ſo far as relates to the inferior planets; and it is highly worthy of remark, that the ſidereal periods of our ſuperior planets are nearer the periods according to La Lande, than Dr. Halley gives them, who wrote more than a century after him, and whoſe aſtronomical tables were long held in the higheſt eſtimation. That the period of Mercury and Venus ſhould not be ſo accurate, we need not be ſurpriſed, when we conſider that they are made ſecondaries to the ſun; nor can we wonder that there is no diſtinction made between a tropical and a ſidereal year; but we think it certainly ſurpriſing, that both the anomaliſtic and ſynodic revolutions of the moon are agreeable to the preſent ſtate of our knowledge of the lunar motions as nearly as may be. As teleſcopes were not invented at the period we are now treating of, the ſecondary planets of Jupiter and Saturn were out of the queſtion; but it appears evident from the mechaniſm before us, that the *mean motions* of thoſe primary planets, which were known two centuries and a half ago, were *then* determined with that degree of accuracy, which left more modern aſtronomers little more to do in practical obſervations, with reſpect to them, than to contraſt their preſent places with ancient determinations, and ſo to correct the inaccuracies which have neceſſarily ariſen from want of good inſtruments of obſervation.

Planetarium of P. Schirleus de Rheita.—The next machine we meet with is the planetarium of P. Schirleus de Rheita, deſcribed in the "Technica Curioſa" of Schott, and made about the year 1650. This machine is ſaid to have repreſented all the true and mean motions of the planets, their ſtations, and direct and retrograde appearances, without epicycles or equations, and with very few wheels by the help of endleſs ſcrews and pullies. The movements were actuated by water, and on the exterior part of the inſtrument were three ſeparate faces, or dials, deſcribed into a number of circles for the orbits of the planets and ſigns of the zodiac; the loweſt face contained the circles of the Sun, Venus, and Mercury, which were denominated the inferior planets, and their reſpective hands or arms; the uppermoſt face had the circles of Saturn, Jupiter, and Mars, with their reſpective hands; and the face in the middle had twelve hours, and alſo a circle for the moon. The firſt wheel which gave motion to all the reſt was carried round by a fall of water once in a minute, on the arbor of which was a ſingle endleſs ſcrew, which drove a wheel of 15 teeth round in as many minutes; on the arbor of this was another ſimilar ſcrew, actuating another wheel of 24 once round in ſix hours; again, on the arbor of the wheel of 24 was another ſcrew, making a wheel of 20 teeth revolve in five days; and laſtly, a ſcrew on the arbor of the laſt mentioned wheel of 20 impelled a wheel of 73 once round in exactly 365 days, which repreſented the annual motion of the ſun in his ſuppoſed orbit round the earth. The laſt ſcrew alſo drove a wheel of 45 teeth round in 225 days, which, by the help of two equal pullies, carried Venus round the ſun in this period; and in like manner, it is ſaid, motions were produced in the reſt of the planets, but the numbers of the other wheels are not given by Berthoud, from whom this account is taken. Alexander, in his "Traité des Horloges," has anticipated, in ſome meaſure, the obſervations which we ſhould have made in theſe words; "this machine," ſays he, "cannot be of great utility, nor will it repreſent the motions of the planets with ſufficient juſtice; for

"1. The firſt wheel which moves all the reſt, is carried round by a fall of water, which cannot have the requiſite regularity.

"2. The movement is not regulated by a balance, pendulum, or fly.

"3. The

"3. The motion of the fun completes the year in exactly 365 days, which makes an error of 25 days in a century.

4. The difcs of the planets are made much too large in proportion to the fun."

The laft of thefe obfervations muft neceffarily conftitute an objection in every inftrument, where the ball for the fun is not made inconveniently bulky.

We are difpofed to think, that the irregularities of motion were not reprefented by the wheelwork in this machine, which appears not to have had accurate movements, but were indicated by the manner in which the circles were divided, fome of which were moft likely excentric. The fuppofed apogeal points (not aphelion points) of the orbits of the planets, are put down in the account for the year 1642, thus:

Saturn	26°	53′	of Sagittarius
Jupiter	7	26	of Libra
Mars	29	49	of Leo
Venus	2	12	of Cancer
Mercury	14	6	of Sagittarius
Sun	6	29	of Cancer.

If we add to thefe numbers the annual motions of the aphelion points, as at prefent afcertained, the above quoted places will be found to differ only in the *minutes*, except in the inftances of Mercury and Venus, in the former of which there is an error of about $2°\frac{1}{3}$, and in the latter, if we reckon forwards, of more than feven figns.

The fyftem which is reprefented by this mechanifm is the fame as was reprefented by the preceding one of Oronce Finée, which proves that the Copernican fyftem had not generally prevailed in the middle of the feventeenth century.

It may not be improper to mention here, that Cardan, who wrote in the middle of the fixteenth century, mentions the names of William of Zealand, and Junellus Turrianus, who invented machines of this defcription about the fame time.

Automaton of C. Huygens.—We come now to the firft machine, in all probability, which reprefented the true folar or Copernican fyftem, namely, the automaton planetarium of Chriftian Huygens; the defcription of this inftrument was not, indeed, publifhed till the year 1703, among the author's other pofthumous works; but Benjamin Martin fays, that this was the *original* from which all the more recent inftruments were afterwards made, and informs us, moreover, that during the refidence of this very ingenious mechanician and able mathematician at Paris, from 1665 to 1681, "he invented and perfected feveral ufeful inftruments and machines" (Biograph. Phil. p. 340.): we muft, therefore, fix the date of the automaton to be in this interval. The learned inventor fays, that he had feen and read of many elaborate inftruments contrived for exhibiting the celeftial motions, but as they were all very imperfect, he employed his mathematical attainments and mechanical fkill, for both which he was juftly renowned, in conftructing a more perfect machine than any which had been before made, inafmuch as it was to reprefent the excentricities and unequable motions of a fyftem, which was likely to maintain its ground amidft the fcrutiny of after ages.

In the "Defcriptio Automati Planetarii" we meet with an account of the numbers, and a drawing of the wheelwork of this machine, which we briefly fhall defcribe, and attach the proper value to each movement, and then make fuch obfervations on them as may occur.

In this machine there is a large watch or clock movement, regulated by a balance and balance fpring, which actuates all the planetary motions, and keeps them contemporary with the real motions in the heavens. The motions are thus effected; a pinion of 4, which revolves by means of the clockwork in 4 days, drives a wheel of 45, on the arbor of which is another pinion of 9, driving a fecond wheel of 73 once round in a year; $\frac{45}{4} \times \frac{73}{9}$ of 4 days being equal to 365 exactly. The laft mover of 73 has a long arbor lying horizontally, or nearly fo, acrofs the machine, on which arbor all the firft moving or driving wheels are placed of the different planetary movements; the ratios, therefore, conftituted by the wheelwork are fo many fractions of 365 days, according to the fubjoined plan, in which the value of each feparate movement is given in days, hours, minutes, and feconds, refpectively: *viz.*

		D.	D.	H.	M.	S.
Mercury's movement - -	$\frac{12}{121} \times \frac{17}{7}$	of 365 =	87	21	50	47.4
Venus' ditto - -	$\frac{32}{52}$	of do. =	224	14	46	9.2
Earth's ditto - -	$\frac{60}{60}$	of do. =	365	0	0	0
Mars' ditto - -	$\frac{158}{84}$	of do. =	686	13	8	34.2
Jupiter's ditto - -	$\frac{166}{14}$	of do. =	4327	20	34	17.1
Saturn's ditto - -	$\frac{206}{7}$	of do. =	10755	17	8	34.2
Moon's lunation ditto - -	$\frac{12}{137} \times \frac{12}{13}$	of do. =	29	12	16	34.49

Befides the above wheels and pinions, there is a fingle fcrew driving a wheel of 300 teeth once round in 300 years of 365 days each, to fhew for what year the inftrument is at any time rectified: alfo the wheel of 73 drives a large wheel of 219 teeth round in three years, on which the days and months are marked.

Upon comparing thefe periods with the exact periods which the beft tables give, the reader will obferve many very confiderable errors, and be difpofed to conclude unfavourably of the calculations here employed; but what will be his furprife when he is told that Huygens wrote exprefsly upon an excellent method of approximating to the

the truth, in calculations of this kind, which no doubt he employed before he began making his inftrument! He will naturally conclude that the fcientific contriver of this mechanifm has not made the moft of his calculations and ingenuity; and that this was really the cafe may be unqueftionably proved; for the fact is, he has calculated periods in fractions of a *folar* year, and afterwards has introduced a firft mover to revolve in a *civil* year of 365 days, as we have feen; whereas, he ought to have made the annual arbor revolve in 365.242 days, as his calculations fuppofed, and then the periods would have been thefe: *viz.*

			D.	H.	M.	S.
Mercury	$\frac{12}{121} \times \frac{17}{7}$ of 365,242	=	87	23	14	47.9
Venus	$\frac{32}{52}$ of ditto	=	224	18	20	48
Earth	$\frac{60}{60}$ of ditto	=	365	5	48	48
Mars	$\frac{158}{84}$ of ditto	=	687	0	4	38.8
Jupiter	$\frac{166}{14}$ of ditto	=	4330	17	30	3
Saturn	$\frac{206}{7}$ of ditto	=	10748	13	21	49.6
Moon	$\frac{12}{137} \times \frac{12}{13}$ of ditto	=	29	12	44	46.35

Thefe periods, being very near the true tropical periods, muft evidently have been calculated from a folar year, and therefore ought to have been produced by wheels placed on a common arbor revolving exactly in that time; hence, the fubftitution of a proper annual movement in this machine will reftore to all the other wheels their proper intended motions, and make the periods what the wheelwork was calculated to effect. See NUMBERS, *Planetary*.

The laft moving wheels, which are here put as numerators of the different refpective fractions, were fo many flat rings with the teeth cut in their pofterior or concealed furfaces, and projecting more or lefs from their planes to meet their drivers; thefe were fupported by intermediate fixed rings with friction rollers at both the inner and outer edges, and the driving wheels or pinions on the common horizontal arbor met their teeth, and impelled them round, whilft they were kept in their proper pofition by the rollers. On thefe moveable rings the planetary balls were fupported, and the aphelion and perihelion points, latitudes, and fhape of the orbits, were marked on the intermediate fixed rings, which, together with the revolving rings, refting on fhoulders turned at the outward and inward edges of the fixed ones, formed the cover of the machine, and concealed the wheelwork from fight. The frame was too feet in diameter, and fix inches deep, placed in an erect pofition; and the periods to be reprefented were collected from the tables of Ricciolus, according to which the folar year was $365^d\ 5^h\ 49^m\ 15^s$, and a lunation $29^d\ 12^h\ 44^m\ 3^s$, as we now generally reckon it. The aphelia, afcending nodes, inclinations of the orbits, mean diftances, excentricities, and proportional diameters, with refpect to the fun, were taken from that ancient aftronomer for January 1, 1682, as expreffed in the annexed table:

	Aphelia.				Afcending Node.				Inclination.			Mean Dift.	Excentr.	Diam. comp. with the Sun.
	°	′	″		°	′	″		°	′	″			
☿	15	11	19	♐	14	29	47	♉	6	54	0	38806	8149	1 : 308
♀	2	59	44	♒	13	54	52	♊	3	22	0	72400	500	1 : 84
⊖	7	7	20	♉								100000	1800	1 : 110
♂	0	30	17	♍	17	38	12	♉	1	50	30	152350	14115	1 : 166
♃	7	55	43	♎	5	30	42	♋	1	19	20	519650	20558	2 : 11
♄	27	39	46	♐	21	36	26	♋	2	32	0	951000	54207	Ring 11 : 37
														Do. to ♄ 9 : 4

It fhould feem from thefe dates that the inftrument was finifhed in the year 1681, which was the year in which Huygens finally left Paris.

In the machine before us no diurnal motion of the earth, nor motion of the moon's nodes or apogee, was introduced, nor yet the motions of Jupiter's or Saturn's fatellites, fo that it was properly what is now called a planetarium, and differed from a common planetarium in what it profeffed to exhibit only, inafmuch as the variable diftances and velocities of the planets were attempted to be exhibited: thefe two requifites are defcribed as being produced in fome of the planetary motions by unequal teeth cut in the laft moving wheels, and in others by means of rings, cut into equal teeth, and placed excentrically as they regarded the fun: but it has been fhewn, when we treated of the different methods that have been devifed for producing unequable motion, under our article EQUATION *Mechanifm*, that neither of thefe two methods, adopted by Huygens in his automaton, as he has defcribed them, will produce more than *one half* of the grand equation, and it does not appear that he, in any inftance, ufed them *jointly;* whence we may fairly conclude, that the accelerations and retardations of velocity, being reprefented in only *half* their due quantity, were much lefs perfect than the author himfelf imagined.

Should our readers wifh to attain a more clear conception of the internal ftructure and external appearance of the automaton of Huygens, he may confult the defcription of Antide Janvier, given in his quarto pamphlet entitled "Des Revolutions des Corps Céleftes par le Mechanifme des rouages," (Paris 1812,) who, like ourfelves, has given the fubftance of the original, together with two plates that illuftrate the conftruction, but which did not fall into our hands till our defcription was finifhed. From a view of thefe plates it is evident, that both Mr. Walker's eidouranion, and Mr. Lloyd's celeftial mechanifm, are copied from the automaton on an enlarged fcale, with but little deviation as to the mode of imparting and modifying the refpective motions, though we have reafon to believe that the periods produced in the latter machines are not fo accurate as in the prototype.

Laftly, the objection which father Alexander made very properly to the preceding machine of Schirleus de Rheita, in regard to its lofing 25 days in a century, is equally applicable

plicable to the automaton, exclusively of its other defects; but this objection would be completely obviated by the substitution of an accurate annual movement, which has been just recommended to rectify the other movements.

Roemer's Satellite Instrument.—The satellite instrument of Romer, or Roemer, presents itself next to our consideration, an account of which was presented by him to the first astronomer royal, Mr. Flamstead, in the year 1679. Romer was mathematician to the French king (Louis XIV.) during the period that Huygens was resident at Paris, under royal patronage, and as this instrument was produced during the residence of Huygens, who had a great propensity for mechanics, as well as astronomy and mathematics, we think it extremely probable that Romer's taste for astronomical mechanism was owing to his acquaintance with Huygens; nor is it improbable that the plan and calculations of it might be submitted to the consideration of the Dutch resident.

This is the first machine in which we meet with a number of *tubes*, or what the French artists have called canons, introduced to move within one another for the purpose of connecting the arms of the planets, or secondaries, with their corresponding wheels, whilst the latter are concealed from sight: this original contrivance was, no doubt, meant to supersede the use of revolving rings and friction-wheels, which were heavy, as well as tedious to make; but then the idea of *variable distances* and *velocities* was given up with its introduction: since the author's time the common planetaria have been made upon this plan, but chiefly with the numbers ascertained by Huygens. (See PLANETARIUM.) The machine before us had a common arbor revolving in seven days, on which all the four driving wheels for the four satellites of Jupiter were fixed fast, which drove each its fellow, placed at the lower extremity of the corresponding tubes; the first satellite had the longest and innermost tube, the second the next, and so on as in the common planetarium.

The numbers of the wheelwork, and their corresponding values in time, may be expressed thus: *viz.*

	Wheels.		D.	H.	M.	S.
Sat. 1.	$\frac{22}{87}$ of 7 days	=	1	18	28	57.93
2.	$\frac{32}{63}$ of ditto	=	3	13	20	0
3.	$\frac{43}{42}$ of ditto	=	7	4	0	0
4.	$\frac{67}{28}$ of ditto	=	16	18	0	0

There appears to be two reasons why seven days was the period assumed for a revolution of the common arbor; first, because a hand placed upon it would indicate the seven days of the week; and, secondly, because a period of seven days is nearly a mean period between the two extreme synodic revolutions of the 1st and 4th satellites, so that it is not necessary to use either a large wheel or a small pinion.

The four pairs of wheels were intended to be kept going by clockwork, but it does not appear that there was any movement proposed to require an annual index to point out the phenomena beyond the present or current moment, on which account the utility of the instrument was circumscribed.

The periodic errors in this instrument are as follow: *viz.*

In the movement of the 1st	=	+ 0′	21″.93
———— 2d	=	+ 2	6
———— 3d	=	+ 0	4
———— 4th	=	− 5	7

Romer's Planetarium.—But the satellite instrument of Romer was not the only instrument of which he superintended the construction: in the "Basis Astronomiæ Roemeri," Hauniæ, 1735, there is an account of a planetarium by this gentleman, constructed with tubes moving round one another, after the plan of his satellite instrument, and finished in the year 1697. The numbers of the wheels were, according to the size of the machine, as under; *viz.*

			D.	H.	M.	S.
Mercury	$\frac{33}{137}$	-	87	23	28	19
or ditto	$\frac{13}{54}$	-	88	2	44	30
Venus	$\frac{24}{39}$	-	224	18	20	48
Earth	$\frac{36}{36}$	-	365	5	48	48
Mars	$\frac{79}{42}$	-	687	0	4	38.3
or ditto	$\frac{47}{25}$	-	686	15	44	20.6
Jupiter	$\frac{83}{7}$	-	4330	17	30	3
Saturn	$\frac{206}{7}$	-	10748	13	21	49.6
or ditto	$\frac{147}{5}$	-	10738	2	54	43

These were the effective wheels of the machine under our present notice; besides which, there were some others of high numbers, which might be considered as dial-work, a part of which effected the revolution of a hand or index in seven days for the week hand, and the rest produced a revolution in ten years, to indicate the year for which the instrument was at any time rectified.

The reason why the author has given the instrument-maker the choice of two pairs of wheels for Mercury, Mars, and Saturn, is, probably, that he might adopt those which best accord with the scale upon which his instrument is to be made. We have here calculated the tropical periods from the standard of an exact solar year; and on examining the numbers, the reader will find that Romer borrowed all his ratios, except those of Mercury, from Huygens; indeed all the modern planetaria of the shops have their numbers taken from the same source, except that, in some instances, 148 has been used for 147 in the wheels of Saturn, either by mistake, or because it was much more convenient to cut into teeth; but the difference occasioned by an omission of this one tooth in each revolution is 127 days' motion; and yet it does not appear that an error of such magnitude has been before detected!

For an account of the manner in which the wheelwork of this planetarium is constructed, and of the mode by which the motion of the planetary bodies are produced, our readers are desired to revert to the title *Common Planetarium*, in our article PLANETARIUM.

 Martinot's

Martinot's Armillary Sphere.—In the "Traité des Horloges" of father Alexander (p. 323.), is contained a defcription of an inftrument made by Martinot, a Frenchman, and prefented to the king of France, on February 28th, 1701, an exact tranflation of which will conftitute the moft faithful account we can give. "The defign of this piece of workmanfhip," fays the author, "is the conftruction of an armillary fphere, which, by the motion of its circles, may imitate thofe of the heavens, particularly of the primum mobile of the fun and moon, and imitate, by a fenfible refemblance, the apparent fituation of heaven at every moment.

"The primum mobile makes its revolution in 24 hours from eaft to weft upon the poles of the world, by means of a movement which is below the equinoctial polar dial-plate. The equator is divided into 360°; and the zodiac, upon which are marked the figns, is pierced (in the middle we fuppofe), that its breadth may not conceal the fun and moon.

"The heaven is compofed of three large circles, namely, the ecliptic and two meridians. The body of the fun is attached to a point of the common fection of the meridian with the ecliptic. The ecliptic, turning upon its centre according to the order of the figns, carries the fun, and makes him perform a revolution through the ecliptic in 365 days; and at the fame time the heaven is carried by the primum mobile from eaft to weft in 24 hours. The heaven of the moon is alfo compofed of three circles, like that of the fun; but the poles are five degrees removed from thofe of the ecliptic. The moon, turning upon the poles of her heaven, moves through the zodiac, according to the order of the figns, in the fpace of one lunar month, and in 24 hours from eaft to weft upon the poles of the primum mobile. The body of the moon is of filver, of a fpherical fhape, one-half of which is darkened, and, prefenting the illuminated half always to the fun, fhews the phafes. The moon's circles carry her from weft to eaft in twenty-nine days and a half, to make a lunar revolution from one conjunction to another.

"In the middle of the fphere there is a little globe which reprefents the earth: this globe is immoveable, and Paris is conftantly on its zenith. The meridian is divided two ways into degrees, which begin at the equator and end at the two poles, upon which the primum mobile turns. The equinoctial dial confifts of two plates; that in the middle has the hours, and is immoveable; the other, which contains the names of the principal cities of the world, is carried by the primum mobile in 24 hours; and one may fee at any inftant what hour it is at each city which is marked. On the immoveable plate is feen the hour of the fun's rifing and fetting. The horizon carries two concentric circles, on which are marked the figns, and their correfponding days of the month. There are alfo the names of the winds and their divifions. Upon the ftand of the fphere are put the allegorical figures which reprefent the four elements. The diameter is two feet."

Such is the account given by Alexander of Martinot's armillary fphere, to which he has annexed the following obfervation. "The motion of this fphere," fays he, "is not very exact, becaufe the fun's period is only 365 days, and wants almoft fix hours in a year. The motion of the moon, too, is performed in $29\frac{1}{2}$ days; fo that it wants 44 minutes in a lunation; and in lefs than three years this quantity amounts to more than a day."

Whether the motion of the fun in this fphere was confidered as *real* or only *apparent*, does not appear certain from the account which is here given. In accommodation to natural appearances, we ftill, it is true, continue to fpeak of the fun's place in the ecliptic; and the idea of the fun's performing an annual journey through the heavens is countenanced by the language of our poets; but in all cafes it will be allowed, that an inftrument ought to exhibit the fyftem which it profeffes to illuftrate, in a manner which cannot miflead the uninftructed. The inventor of the armillary fphere before us, we are difpofed to believe, like Martin and Parke in our own time, affected to difcredit the Copernican fyftem.

Pigeon's Sphere.—Nearly about the fame time with Martinot, M. Jean (or John) Pigeon conftructed a fphere, in which the planets were introduced and kept in motion by clockwork: the account which M. Saverieu has given of this inftrument in his "Dictionnaire des Mathematiques," makes it rank much higher in our eftimation than the laft we examined, and it is much to be regretted, that the numbers of the wheelwork have not been tranfmitted to us. The author expreffes himfelf to this purpofe: "Many ages have paft over, before we have found ourfelves in a fituation to execute the plan of the fphere of Archimedes. It is not till our own days that a fphere in motion has been feen, for which we are indebted to the fkill of our ingenious artift, M. Jean Pigeon. His fphere is eighteen inches in diameter, and elevated to the height of five feet four inches by a fupport, from the fummit of which is fufpended a pendulum: in the middle of the fphere ftands the reprefentative of the fun, which is a large gilt ball, and all the planets are attached to their orbits in refpective order. Thus, Mercury is the neareft to the Sun, next moveth Venus, then the Earth, Mars, Jupiter, and Saturn. A pendulum gives motion to all the planets, and conducts them within the fphere, according to the order of the figns around the fun as their common centre. The earth turns upon its axis in 24 hours, and alfo makes the tour of the zodiac, according to the order of the figns, in $365^d\ 5^h\ 49^m$. Around the earth is a little circle which reprefents the ecliptic, fo that one may judge in what fign any planet is, and whether its declination be north or fouth. This circle alfo ferves to afcertain the retrogradations, direct motions, and ftations of the planet. There are alfo two other fmall circles round the earth, one of which reprefents the horizon, and the other the meridian, which is adjuftable to any place on the earth. To the orb of this planet is attached an index, pointing towards the fun, the ufe of which is to mark the times of the new and full moons; another index is placed below the moon to mark her latitude upon a plate, on which are marked the nodes, called the *head* and *tail* of the *dragon*, by means of which one may fee if the moon be at any time in the ecliptic, &c."—From this defcription of Pigeon's fphere, it feems to have been the moft comprehenfive reprefentation of the Copernican fyftem of any which we have hitherto met with, inafmuch as the diurnal motion of the earth, and the motion of the moon's nodes, have been added to the revolutions of the planets. All the motions, we muft conclude, were mean motions, and as nothing is faid about the wheelwork, we know not how far thefe motions were accurate. The plan, however, feems to have been happily conceived, and well calculated to produce a pleafing object to the eye of a fpectator.

Orrery by Graham and Rowley.—We have now come down to the time when our own country produced in a machine a combination of the annual and diurnal motions of the earth, together with the motions of the moon and primary planets, and gave to fuch combination the name of *Orrery*, in honour of the earl of Orrery, who at that time patronized the fciences; but as we have defcribed this complex mechanifm with confiderable minutenefs under our article ORRERY, it would be fuperfluous to fay more in in this place, than that the date alluded to was about the year 1715.

A Sphere moving by Clockwork, calculated by M. Paſſemant, and conſtructed by Dauthiau, Clock-maker to the King of France.—As this machine appears to be much ſuperior to any of the preceding ones, both in accuracy and extent, it claims a detailed notice, which cannot be given more faithfully than by tranſlating the abridged deſcription given by Ferdinand Berthoud, from a ſmall pamphlet of Dauthiau, publiſhed at Paris in 1756, in duodecimo.

"This clock, which is ſurmounted by a ſphere, which it puts in motion according to the Copernican ſyſtem, was preſented to the Academy of Sciences on the 23d of Auguſt 1749, by M. Paſſemant, the author of the calculations of the ſphere, to which he applied himſelf about 20 years. The gentlemen of the academy, from the report of Meſſrs. Camus and Deparcieux, the committee named for the examination of this clock, have certified that the revolutions of the planets are exact in it; for that they did not find a degree of difference from the aſtronomical tables in leſs than 3000 years. Dauthiau, the clock-maker, who conſtructed this machine, employed twelve years upon it. It was preſented to the king at Choicy on the 7th of September 1750. His majeſty, being a protector of the ſciences and arts, teſtified his ſatisfaction of it, and ordered a new caſe to be made for it after a deſign of his own choice, which was executed by Meſſrs. Caffiery, father and ſon, after which it was again preſented to the king at Choicy, the 20th of Auguſt 1753, and thence ſent to Verſailles.

"The ſphere repreſents from day to day the different motions of the planets round the ſun, *i. e.* of Saturn, Jupiter, Mars, the Earth, Moon, Venus, and Mercury, alſo their places in the zodiac, their configurations, ſtations, and apparent retrogradations with reſpect to the earth. Upon every circle which carries the orb of a planet, is engraven the time of its revolution round the ſun. The earth, during its annual revolution, makes its movement of paralleliſm, and views the ſun paſſing through the ſigns and degrees of the zodiac; alſo through the months and their day ſpaces, (quantièmes,) indicating the ſeaſons, the equinoxes, and ſolſtices; beſides, it makes a rotation in 24 hours, being divided by 24 meridian lines: it has likewiſe a map of the principal places of the globe; ſo that the riſing, ſetting, and meridian paſſage of the ſun, together with his different elevations, and the continuance of day and night, may be ſeen for every principal place. The moon finiſhes her revolution round the earth in $29^d\ 12^h\ 44'\ 3''$, during which time are indicated her age and different phaſes; her progreſs through the ſigns of the zodiac; her nodes, her eclipſes, and thoſe of the ſun with preciſion, *viz.* their place, ſize, and duration; beſides the various altitudes, and times of riſing, ſetting, and ſouthing.

"The clock beats ſeconds, which are indicated in the centre of the dial-face by a dead-beat eſcapement (échappement à repos) of a particular conſtruction. This clock effects the equation by itſelf, by ſhewing both apparent and mean time (called by the French "le temps *vrai* et le temps *moyen*," which, in England, mean the ſame thing); it ſtrikes the hours and the quarters of ſolar time, which it will repeat at pleaſure. The movement of the ſtriking part is by a ſpring, fuſée, and chain, that of the clock by a weight of twenty pounds doubly-ſuſpended, which has a deſcent of eight inches in ſix weeks, and the going is not interrupted by winding up the weight. The pendulum rod conſiſts of bars of ſteel and braſs, adjuſted ſo as to keep the metallic lens always at the ſame diſtance from the point of ſuſpenſion by the difference of their expanſions; and by this difference a hand is made to point out the variation of temperature on a divided circle on the top of the rod, which forms therefore a natural thermometer by the ſole action of metals.

"On the front of the clock, over the face, is a planiſphere marking the age and phaſes of the moon; in which are, beſides the day of the week, the names and days of the month, and year ſpaces after a new and ſingular method; for though ſome months have 28, 30, and 31 days each, yet the clock makes February to have 29 days every fourth year for biſſextile. The mechaniſm for ſhewing the days of the year will point them out for ten thouſand years, if the clock will wear ſo long, by means of four indexes revolving reſpectively in 10, 100, 1000, and 10,000 years."

In this clock and ſphere are three contrivances for diſengagement; the firſt for the eſcapement; the ſecond for the ſphere to be detached from the clockwork to move by a handle; and the third for detaching the diurnal motion of the earth, that the planets may have a quick motion by means of a correſponding handle. Thus the different portions may be diſengaged from each other to make the neceſſary rectifications. The number of wheels and pinions employed in this mechaniſm are 60, ſome of which are in the interior part of it; the diameter of the ſphere is one foot, and is ſurrounded by a cover of glaſs; the caſe of the clock is d'or moulu, with four faces, having glaſs covers, neatly deſigned, well finiſhed, and expoſed ſo far to view, that all the mechaniſm may be ſeen: the whole height from the top of the ſphere is ſeven feet.

According to the report of Antide Janvier, who was employed to repair this inſtrument, previouſly to its being placed in the gallery (of the firſt conſul) at the palais des Thuilleries at Paris, in the year 8, the following are the numbers of the wheels and pinionswhich are put down in his own method of noting them, and alſo their reſpective values in time.

The periodic revolution of the Moon from a motion of 48 hours.

$$\left.\begin{matrix}\text{Pinions} & 72.25.20.41.20\\ \text{Wheels} & 75.54.44.31.73\end{matrix}\right\} = 27^d\ 7^h\ 43'\ 4''\ 58'''.$$

Revolution of Mercury from a motion of 27 days 7 hours, &c.

$$\left.\begin{matrix}\text{Pinions} & 31.\ 85\\ \text{Wheels} & 84.101\end{matrix}\right\} = 87^d\ 23^h\ 14'\ 15''\ 56'''.$$

Annual revolution of the Earth from a motion of 87 days 23 hours, &c.

$$\left.\begin{matrix}\text{Pinions} & 8.35.83\\ \text{Wheels} & 43.44.51\end{matrix}\right\} = 365^d\ 5^h\ 48'\ 58''\ 3'''.$$

Revolution of Venus from a motion of 365 days 5 hours 48 minutes, &c.

$$\left.\begin{matrix}\text{Pinions} & 53.76\\ \text{Wheels} & 42.59\end{matrix}\right\} = 224^d\ 16^h\ 40'\ 30''.$$

Revolution of Mars from a motion of 365 days 5 hours 48 minutes, &c.

$$\left.\begin{matrix}\text{Pinions} & 53.75\\ \text{Wheels} & 84.89\end{matrix}\right\} = 1^y\ 321^d\ 16^h\ 32'\ 11''.$$

Revolution of Jupiter from a motion of 365 days 5 hours 48 minutes, &c.

$$\left.\begin{matrix}\text{Pinions} & 9.45\\ \text{Wheels} & 49.98\end{matrix}\right\} = 11^y\ 312^d\ 22^h\ 28'\ 0''.$$

Revolution of Saturn from a motion of 365 days 5 hours 48 minutes, &c.

$$\left.\begin{matrix}\text{Pinions} & 7.\ 40\\ \text{Wheels} & 80.103\end{matrix}\right\} = 29^y\ 156^d\ 12^h\ 46'\ 40''.$$

Revolution of the Moon, with reſpect to the node, from a motion of 29 days 12 hours 44 minutes 3 ſeconds.

$$\left.\begin{matrix}\text{Pinions} & 50.67\\ \text{Wheels} & 49.63\end{matrix}\right\} = 27^d\ 5^h\ 5'\ 36''.$$

N. B. Each dot between the figures in the above examples is a ſign of multiplication.

"It

"It may be aſked," ſays Janvier, in a note to his report, "where is the revolution of $29^d\ 12^h\ 44'\ 3''$ which gives motion to this laſt movement, it being not contained in the preceding ſtatement; but we have ſeen the periodic revolution, which conſiſts of the time in which the moon goes round the heavens; that interval, we know, is ſhorter than a ſynodic revolution; but this (ſynodic) revolution has no real exiſtence, but by means of the earth's change of ſituation, whoſe orbit carries a wheel immoveably fixed at the centre of the moon's orbit, round which the moon revolves really in $29^d\ 12^h\ 44'\ 3''$; it is this wheel, then, which gives motion to the wheelwork which repreſent the eclipſes with great accuracy. The laſt wheel of this movement carries a ſmall dial-plate on which the moon ſhews her poſition with reſpect to the node; this dial carries beſides an excentric piece, which makes the moon's place above and below the plane of the ecliptic within the limits of her greateſt latitude.

"The dial of the nodes is placed vertically, it accompanies the moon, and turns round the earth at the ſame time that it makes a revolution round its centre in the period we have ſpecified. This peculiarity has rendered the calculation ſingularly complex, and the effect leſs convenient to obſerve. Notwithſtanding this defect, this function is one of thoſe which ſhews a greater genius than that of Paſſemant; it was neceſſary to be better acquainted with aſtronomy than the reſt of the parts demand, to deviſe a ſimilar diſpoſition of parts, which it is impoſſible to comprehend without figures."

P. le Roi, ſpeaking of this ſphere, ſays "the calculations are ſo exact, that one could hardly imagine it poſſible to arrive at ſuch accuracy."

Such are the ample notices which we have procured of this inſtrument; but notwithſtanding the accuracy of the mean motions above ſtated, it muſt be recollected that, as the equations of the centre and excentricity are not attempted to be repreſented, nor even the relative diſtances, the conjunctions, oppoſitions, ſtations, and retrogradations will be far from accurate in reſpect to the *times* of their appearance; beſides, the want of the five laſt diſcovered planets renders it otherwiſe at this time incomplete.

In the account which has been here tranſlated, it does not appear whether the *year* mentioned in the periods of Mars, Jupiter, and Saturn, is a ſolar or civil year of $365\frac{1}{4}$ days, or whether it is taken at 365 exactly; we will therefore go through all the calculations again according to our own method, which, though attended with ſome trouble, (ſee NUMBERS, *Planetary*,) will afford us the ſatisfaction of knowing the preciſe value of each movement in days and parts of a day. The whole work abridged will ſtand thus: *viz.*

			D.	H.	M.	S.
Moon's period -	$\frac{75}{72}\times\frac{54}{25}\times\frac{44}{20}\times\frac{31}{41}\times\frac{73}{20}=\frac{403266600}{29520000}$ of 2^d	=	27	7	43	4.96932
Mercury's revolution	$\frac{84}{31}\times\frac{101}{85}=\frac{8484}{2635}$ of $27^d.3215853$	=	87	23	14	16.4976
Earth's revolution -	$\frac{43}{8}\times\frac{44}{35}\times\frac{51}{83}=\frac{96492}{23240}$ of $87^d.9682465$	=	365	5	48	59.04048
Venus' ditto -	$\frac{42}{53}\times\frac{59}{76}=\frac{2478}{4028}$ of $365^d.2423507$	=	224	16	40	28.408
Mars' ditto -	$\frac{84}{53}\times\frac{89}{75}=\frac{7476}{3975}$ of ditto	=	686	22	21	23.76
Jupiter's ditto -	$\frac{49}{9}\times\frac{98}{45}=\frac{4802}{405}$ of ditto	=	4330	14	26	43.64
Saturn's ditto -	$\frac{80}{7}\times\frac{103}{40}=\frac{8240}{280}$ of ditto	=	10748	4	52	59.20
Moon's node -	$\frac{49}{50}\times\frac{63}{67}=\frac{3087}{3350}$ of $29^d.53059$	=	27	5	5	32.67

From theſe calculations we find that the *ſolar* year is the year intended, as mentioned in the periods of Mars, Jupiter, and Saturn, which year is made by the wheelwork $11''$ longer than La Lande's tables make it. The revolutions of the planets in his machine are tropical, and, though not ſo accurate as they might have been calculated in a ſhorter time than *twenty years*, yet are they more accurate than in any other machine which preceded it. The period of Saturn, which is the moſt inaccurate, is pretty nearly equally diſtant from that of Dr. Halley and that of La Lande.

Paſſemant's Planetary Clock.—Beſides the preceding machine of M. Paſſemant, this author invented a clock in the year 1754, which has a caſe of five feet in height, and which gives motion to a terreſtrial globe of four inches in diameter, on which the different countries are engraven, and which is placed in the midſt of artificial rocks and waterfalls that ſerve as an univerſal horizon: at ſome diſtance is repreſented the ſky, containing a ſun of three feet diameter, and all the primary planets in motion round him, according to their reſpective velocities, and the four neareſt according to their proportional diſtances; the excentricities and alternate increaſe and decreaſe of velocity at the perihelion and aphelion points are alſo effected, and all the phenomena depending upon the earth's paralleliſm and diurnal rotation are accurately repreſented. There is alſo a moon performing a lunation, and all her various phaſes in the ſky, in a natural manner. F. Berthoud has given his abridged notice of this clock from "Deſcription et Uſage des Teleſcopes," a work publiſhed at Paris by Paſſemant in 12mo.; but as there is no account given of the numbers of the wheelwork, nor other particulars of the conſtruction, we muſt ſuppoſe that the numbers of the preceding machine were adopted: the clock is ſaid to have been made for the king of Golconda, and to be ſtill in exiſtence at Paris. It is matter of regret that we have it not in our power to deſcribe by what contrivance the excentricity of each orbit is effected.

Aſtronomical Machine by Phil. Mat. Hahn.—If we paſs over the days of Benjamin Martin and James Ferguſon, whoſe whofe aftronomical mechanifm has in part been explained under our article Orrery, and is to be found in their works in almoft every one's hands, we meet with no original machinery of any importance till we arrive at the year 1791, in which a defcription was publifhed in a pamphlet, in London, of a planetarium or aftronomical machine, invented and partly executed by Phil. Mat. Hahn, member of the Academy of Sciences at Erfurt, and completed by Albert de Mylins.

This machine confifted of three feveral portions, which were actuated by a pendulum clock, and which compofed three different fyftems; *viz.* 1ft, the folar fyftem of feven primary planets; 2dly, the particular planets only which have fecondaries, in which thofe fecondaries have their motions given by wheelwork as well as their primaries; and 3dly, a celeftial fphere of copper, with 1500 ftars engraved on it, in which were contained about 100 wheels that gave motion to the planets as they appeared when viewed from the earth. All thefe motions are faid to have been produced by trains of wheelwork that were calculated with the greateft accuracy, but as the numbers have not been difclofed that compofe the teeth of thofe wheels, we cannot form an eftimate of their accuracy; neither can we gratify our readers with an account how the inequalities of motion were produced, according to which feveral of the planets are ftated to have moved. The whole fabric was of the beft workmanfhip, and its different portions were fo fymmetrically arranged, that it was deemed a handfome prefent to be taken by lord Macartney in his capacity of ambaffador to China, where probably its ufes will not be duly appreciated.

Planifphere and Sphere by Antide Janvier of Paris.—A. Janvier, whofe new *orrery* we have defcribed in its place, received his mechanical and mathematical inftructions from l'Abbé Tournier, who maintained a fyftem of aftronomy in fome refpects fimilar to that of Ptolemy; and during the early part of his life the pupil employed himfelf in reprefenting, by means of wheelwork, the planetary fyftem of his mafter, as feen from the earth as the centre of all the apparent motions. The terreftrial globe, placed in the middle of the fyftem, was made to have the diurnal motion, while the fun was made a planet, with his fecondaries, Mercury and Venus, beyond the orbit of the moon, which was confidered as the firft planet. The other planets had their periodic revolutions in their refpective times; but, to reprefent the retrogradations and ftations, a fecond arm was made to revolve at the point of mean diftance, in the fame direction as the radius vector of each planet, once in each *fynodic* revolution, as they regarded the fun, each fhort arm being made equal to the radius vector of the fun. This arrangement produced the geocentric appearances fo well, that the author of the fyftem pertinacioufly withftood all the arguments of Caffini in favour of the Copernican fyftem; and a perufal of it has probably laid the foundation of what has very recently been denominated the *Martinian* fyftem by a pretender, who is endeavouring, in our own time, to inftitute a *Society*, under *royal patronage*, for the defence of his fyftem, as compared to that of Copernicus and fir Ifaac Newton! Janvier, however, was foon convinced that the fyftem of his preceptor was erroneous, and in the year 1789 he began the conftruction of a fphere that was to include the motions of the planets agreeably to the Newtonian fyftem, and that was finifhed in the year 1801, after a period of eleven years fpent in the calculations and conftruction. The fphere is mounted on a pillar with four faces, in the interior of which pillar are concealed a great variety of wheels and pinions, that are put in motion, like Hahn's machine, by a feconds' pendulum clock of the beft conftruction. To thefe four faces are attached feveral dials and correfponding hands to indicate the various phenomena of the planets that are exhibited within the fphere, where the heavenly bodies are in motion. It would not be poffible to give fuch a verbal defcription of this machine as would enable the reader to comprehend the peculiarities of its conftruction, without feveral plates for the reprefentation of the refpective parts; but we will not conclude our prefent article without giving an abridged account of its leading features. The trains of wheelwork contained within the pillar, and giving motion to the hands, have each fix or eight wheels and pinions, from which confequently great accuracy may be expected; but thofe that actuate the planets within the fphere are not fo numerous, and confequently not fo accurate; fo that the indication of the phenomena is more exact than the occurrence of thofe phenomena. The wheels and pinions that are principally employed, and the periods correfponding to the refpective trains, may be put down thus:

The Tropical Revolutions.

					D.	H.	M.	S.
Mercury	-	$\frac{80}{10} \times \frac{140}{43} \times \frac{179}{53}$	of 24 hours	=	87	23	14	30
Venus	-	$\frac{62}{7} \times \frac{81}{17} \times \frac{197}{37}$	of ditto	=	224	16	41	25
Earth	-	$\frac{52}{7} \times \frac{61}{13} \times \frac{241}{23}$	of ditto	=	365	5	48	$49\frac{3}{10}$
Mars	-	$\frac{89}{6} \times \frac{137}{6} \times \frac{144}{71}$	of ditto	=	686	22	18	35

The Moon's Apogee.

From 24^h - -	$\frac{69}{6} \times \frac{127}{8} \times \frac{177}{10}$	=	3231 8 33 0
From $27^d\ 7^h\ 43^m$	$\frac{57}{10} \times \frac{74}{13} \times \frac{113}{31}$	=	3231 8 44 0
From 365 5 48 49^s	$\frac{93}{98}$, *viz.* $\frac{93}{98-93}$	=	$19\frac{3}{5}$ years

The Moon's Nòde.

From half synodic revolution of the Moon	$\frac{106}{25} \times \frac{259}{59}$	=	6798 5 0 0
From $365^d\ 5^h\ 48^m\ 49^s$ - -	$\frac{115}{102}$, *viz.* $\frac{115}{115-102}$	=	$8\frac{11}{13}$ years.

Besides these trains of wheelwork, there is one that converts mean solar into sidereal time, the numbers of which are these, *viz.* $\frac{19}{29} \times \frac{67}{40} \times \frac{239}{63} = \frac{304247}{305085}$, the difference between the numerator and denominator of which large fraction is 833; the acceleration of sidereal on solar time is, therefore, $\frac{86400'' \times 833}{305085} = \frac{2160 \times 833}{7627} = 3'\ 55''\ 54'''\ 33''''\ 40'''''$; and the time required for its accumulation into 24^h will be very nearly $365^d\ 5^h\ 48^m\ 49^s$. There are various ingenious contrivances in the construction of this machine, that attest the mechanical skill of the inventor, but which cannot be intelligibly described without drawings: the principal of them are the manner in which the diurnal train is made to act; a representation of the two separate causes of the equation of time; and an union of the grand equation, of the evection, and of the heliocentric latitude of the moon, in every part of her orbit. In both the planisphere and the sphere there are some complex calculations introduced, in order that the periods, which would be altered by the mode in which the wheels are placed for action, may be rectified by corresponding alterations in the numbers of the wheels, after the original calculations were made. But accurate as the trains in general are, we are of opinion that, in many cases, fewer wheels would have effected equal accuracy in the periods, particularly in that of Georgian, which is very erroneous; and as the four newly-discovered planets are left out, the machine cannot be called perfect at the present moment, notwithstanding the great pains that have been bestowed upon its construction for the continued space of eleven years. A memoir of this elaborate machine was laid before the National Institute of France, through the medium of Coulomb, Delambre, and Fred. Berthoud, which the last named has copied into his "Histoire du Temps," together with the various drawings, which the curious reader may consult with advantage, who wishes to make himself master of all the particulars of the construction.

In this historical sketch we might have introduced notices of other machines, such as the orrery of Ribright in the Poultry, of Dean in Dublin, and of Bolton, belonging to her majesty, at Windsor, if we had been aware that there is any thing peculiar in the construction of any of them; and with respect to the pendulous orrery of Rittenhouse in Philadelphia, and to that lately exhibited at the Pantheon, London, as well as to Mr. Walker's eidouranion, and Mr. Lloyd's dioastrodoxon, we consider these not as objects of close

close examination, but as conveying only general information by a scenic effect, not depending on the accuracy of the wheelwork, and therefore not claiming our minute attention. For an account of those modern machines, which appeared to us to merit a more particular description than we could allot them in this article, we must request the reader to consult our articles ORRERY, PLANETARIUM, and SATELLITE *Machine*.

PLANETARY *Dials*, those whereon the planetary hours, latitudes, or equations, are inscribed. See DIAL, ORRERY, and PLANETARIUM.

PLANETARY *Globe*. See GLOBE.

PLANETARY *System*, is the system or assemblage of the planets, primary and secondary, moving in their respective orbits round their common centre, the sun.

PLANETARY *Squares*, the squares of the seven numbers from 3 to 9, disposed magically.

Corn. Agrippa, in his famous book of magic, has given the construction of the seven planetary squares: M. Poignard, canon of Brussels, in his Treatise of Sublime Squares, gives new, easy, and general methods for making the seven planetary squares, and all others to infinity, by numbers, in all sorts of progressions. See MAGIC *Square*.

PLANGESTA, in *Geography*, a town of Bengal; 21 miles N.N.W. of Kishenagur.

PLANIARY, a town of Bohemia, in the circle of Kaurzim; 3 miles N.N.E. of Kaurzim.

PLANIER, a small island in the Mediterranean, near the coast of France. N. lat. 43° 12′. E. long. 6° 19′.

PLANIFOLIOUS FLOWERS. See FLOWER.

PLANIMETRY, PLANIMETRIA, that part of geometry which considers lines and plain figures; without any consideration of heights or depths.

Planimetry is particularly restrained to the mensuration of planes or surfaces; in opposition to *stereometry*, or the mensuration of solids. See MEASURING and SURVEYING.

Planimetry, or the art of measuring the surfaces and planes of things, is performed with the squares of long measures, as square feet, square inches, square yards, square perches, &c.; that is, by squares whose sides are an inch, a foot, a yard, a perch, &c.; so that the area or content of any surface is said to be found, when we know how many such square inches, feet, yards, &c. it contains.

PLANING MACHINES, are machines used to diminish the great manual labour of planing the surface of planks and boards of wood: in strictness, those alone should be termed planing machines, which operate to reduce the surface of the wood to a true and smooth plane, by means of planes or instruments of a similar nature, though actuated by the power of machinery instead of the strength of a man's arm; but custom has denominated those machines which cut flat surfaces in a different manner from planes by the same name.

These machines are of modern invention; the first, we believe, was projected by general Bentham, who obtained a patent for it in 1791. It consisted of a plane, to be put in motion by means of a crank turned by a mill, to give it a reciprocating motion; or on a smaller scale it might be worked by hand in the usual manner, but the plane was so formed as to require none of the skill and attention necessary in the ordinary method of operating: here the workman, besides exerting the force necessary to force the instrument along, has several points to attend to, even in the simple case of planing a straight board he must adjust his tool to the board in a proper manner for beginning the stroke, and employ sufficient force to keep it down to the board; and in returning, he must raise it up off the board sufficient to save the cutting edge from injury; he must also guide it sideways to prevent it slipping off the board, and if this is wider than the plane, he must constantly examine if he reduces the middle and the sides in a proper manner to make a plane surface; and, lastly, he must observe the marks he previously makes for the thickness of the board, that he may keep it parallel, and not reduce it too thin. By the general's invention all these circumstances are gained at once; the plane is made the full width of the boards intended to be planed, and on each side of it fillets or cheeks are fixed, which project beneath the face of the plane just as much as the thickness the board is to be reduced to: these cheeks, therefore, guide the plane sideways in passing along the board, and gauge it in thickness; because, when the board is reduced to the quantity which the cheeks are beneath the surface of the plane, the cheeks rest upon the bench or surface on which the board lies, and bear off the plane, so that it can cut no longer. The plane is kept down by its own weight, which is increased, when necessary, by loading it with weights, and these are contrived to be capable of shifting their position from one end of the plane to the other during the time it is making the stroke; because, at first the pressure is required at the fore end to enter the cut, but at the conclusion it must be greatest at the hinder end, to prevent the fore end tripping down the instant it leaves the board. By another contrivance the plane is caused to rise up sufficiently to clear the cutting edge from the wood when the plane is on its return. It is by a piece which acts as a handle to the plane, and to which the power is applied, that it is fixed in the manner of a lever upon an axis extending across the width of the plane, and carrying at each side thereof a short lever, provided with rollers in their extremities; the handle projects upwards from the plane, which being forced forwards by it, assumes an inclined position, as do also the short levers, and their rollers then rise above the cheeks of the plane; but when the plane is drawn back, its handle is first drawn back into an erect position, and the levers moving with it, their rollers project beneath the cheeks of the plane, and raise it off the bench, the plane being in its return borne by them.

The bench for supporting the board during the operation was also of a peculiar construction, in order to confine the work steady upon it. In cases when the boards to be planed are winding or irregular on the lower side, so that they cannot lie flat upon the bench, it is provided with two sides, which can be brought to close upon the edges of the board, and hold it steady between them, being furnished with one or more rows of flat teeth to penetrate the wood and retain it; these sides are contrived to rise or fall upon the bench, to accommodate the different thicknesses of the boards. When a very thin board is to be planed, it might be liable to spring up to the iron, so as to be reduced even after the plane came to rest with its cheeks upon the bench; to avoid this the edges of the board are to be held by the sides to the bench above-mentioned, but as it would still be liable to spring up in the middle part, heavy rollers, or rollers loaded with weights, are fitted in apertures made in the plane as near as possible to the cutting edge, and these will keep the board down close upon the bench. For planing pieces of greater thickness at one end than the other, the cheeks of the plane are to be borne upon rulers of wood laid on the bench on each side, the wood being as much thicker at one end as the board is intended to be thinner at that end; therefore, when the plane has reduced the wood, the cheeks come to bear upon these rulers, and cause it to move not parallel to the bench, but inclined, according as they are thicker at one end than the other: in like manner, by using them of different thicknesses at the different sides the boards may be made feather-edged.

Mr. Bramah invented a planing machine, which he has used ufed very advantageoufly for planing all kinds of timber flat, at an exceedingly fmall expence. In 1802 he took out a patent for the invention, which he defcribes in his fpecification to confift in the following particulars. "The cutting tools employed to reduce the wood, inftead of being worked by hand are to be fixed on frames, fome of which are moved in a rotatory direction round an upright fhaft, and others have a fhaft lying in a horizontal pofition like a common lathe. In other inftances, the tools are fixed on frames, which flide in ftationed grooves to be driven alfo by machinery. The principal points on which the merits of the invention reft are, 1. The materials to be wrought are made to flide in contact with the tool, inftead of the tool being carried by the hand over the work in the ufual way. 2. The tool is made to travel acrofs the work in a fquare or oblique direction, except in cafes where it may be neceffary to fix the tool in an immoveable ftation, and caufe the work to fall in contact with it by a motion. 3. Inftead of common tools, bent knives, fpoke fhaves, or deep cutting gouges, are ufed for cutting off the rougheft parts, and planes of various fhapes and conftructions, as the work may require, are applied to follow the former in fucceffion, under the fame operation, and which latter I call finifhers. 4. Thefe are fixed on frames which move in cafes, like thofe on which the faws are fixed in a fawing-mill, and in other inftances thefe frames are fixed on a rotatory upright fhaft turning on a ftep, and carrying the frame round in a direction fimilar to the upper millftone for grinding corn, and fometimes the frames turn on a horizontal fhaft, refembling the mandrel of a common turning lathe. The different planes, tools, &c. are fixed in the frames, fo as to fall fucceffively in contact with the wood or other materials to be cut, fo that the cutter or tool calculated to take the rough and prominent part operates firft, and thofe that follow muft be fo regulated as to reduce the material down to the line intended for the furface. Thefe cutter frames muft alfo have the property of being regulated by a fcrew, or otherwife, fo as to approach nearer the work, or recede at pleafure, in order that a deeper or fhallower cut may be taken at difcretion, or that the machine may repeat its action, without raifing or depreffing the material on which they act. 5. When an upright fhaft is ufed, the pivot is to turn in oil, and it may be raifed or depreffed at pleafure, by means of a greater or lefs quantity of the faid fluid being confined between the end of the fhaft and the bottom of the ftep. 6. The materials to be cut muft be firmly fixed on a frame, fimilar to thofe in fawing-mills, on which the timber is carried to the faws. Thefe frames muft be moved in a fteady progreffive manner as the cutter frame turns round, either by the fame power which moves the latter, or otherwife, as may be found to anfwer beft in practice. 7. The motion of the cutter frames muft be under the controul of a regulator, fo that the velocity of the tool, in paffing over the work, may be made quicker or flower as fuch work may refpectively require, to caufe the cutter to act properly to the beft advantage." For this purpofe Mr. Bramah propofes to ufe what he calls a univerfal regulator of velocity, and which he defcribes as follows: "I take any number of cog-wheels, of different diameter, with teeth that will exactly fit each other through the whole; fuppofe ten, or any other number, but for an example fay ten, the fmalleft of which fhall not exceed one inch in diameter, and the largeft fuppofe ten inches in diameter, and all the reft to mount by regular gradation in their diameters from one to ten. I fix thefe ten wheels, faft and immoveable, on an axis perfectly true, fo as to form a cone of wheels; I then take ten other wheels, exactly the fame in all refpects as the former, and fix them on another axis, alfo perfectly true, and the wheels in perfect gradation alfo; but thefe latter wheels I do not fix faft on their axes, like the former, but leave them all loofe, fo as to turn upon the faid axes, contrary to the former, which are all fixed. All thefe latter wheels I have the power of locking, by a pin or otherwife, fo that I can at difcretion lock or unite any fingle wheel at pleafure to the axis. I then place the two axes parallel to each other, with the wheels which form the two cones as above defcribed, in reverfe pofition, fo that the large wheel at one end of the cone may lock its teeth into the fmalleft one in the cone oppofite, and likewife *vice verfâ*. Then fuppofe the axis, on which the wheels are permanently fixed, to be turned about all the wheels on the other axis will be carried round with velocities correfpondent to their diameters and thofe of the former, but their axes will not move. Then lock the largeft wheel on the loofe axis, and by turning about the faftened axis, as before, it muft take ten revolutions, while the oppofite wheel performs but one; then by unlocking the largeft wheel, and locking the fmalleft one at the contrary end of the cone in its ftead, and turning as before, the faftened axis will then turn the oppofite ten times, while itfelf only revolves once. Thus the axes or fhafts of thefe cones, or conical combinations of wheels, may turn each other reciprocally, as one to ten, and ten to one, which collectively produces a change in velocity, under an uniform action of the primum mobile, as ten to a hundred; for when the fmall wheel on the loofe axis is locked, and the faft one makes ten revolutions, the former will make one hundred; and by adding to the number of thofe wheels and extending the cones, which may be done *ad infinitum*, velocities may be likewife infinitely varied by this fimple contrivance: A may turn B with a fpeed equal to thoufands or millions of times its own motion; and by changing a pin and locking a different wheel, as above defcribed, B will turn A in the fame proportion, and their power will be transferred to each, in proportion as their velocities reciprocally. Here is an univerfal regulator at once for both power and velocity. In fome inftances I produce a like effect, by the fame neceffary number of wheels made to correfpond in conical order, but inftead of being all conftantly mounted on the axes or fhafts, as above defcribed, they will reciprocally be changed from one axis to the other, in fingle pairs, to match according to the fpeed or power wanted, juft as in the former inftance. This method will have, in all refpects, the fame effect, but not fo convenient as when the wheels are all fixed."

The utility of Mr. Bramah's machine, not lefs than its ingenuity, has induced us to procure drawings of one of them, which he has in conftant ufe in his factory at Pimlico. It is upon exactly the fame conftruction as one he made for the royal arfenal at Woolwich, by which all the timber for gun-carriages, and other fimilar articles, is now planed at a trifling expence, compared with the old method of planing by hand labour. See *Plates* I. and II. *Planing Machine*, where *fig*. 1. is a plan of the whole machine, and *fig*. 2. an elevation thereof; A *a* is a vertical axis, put in motion by a fteam-engine, the power being communicated to it by a pair of bevelled wheels B, one fixed on the vertical fhaft, and the other at the extremity of a horizontal fpindle C, *fig*. 1; fee alfo *fig*. 8. *Plate* II. which has a live and dead pulley upon it at *c*, for the reception of an endlefs ftrap, by which the machine is driven. The fhaft *a* A is for the purpofe of carrying an iron wheel 33, fhewn feparate in *fig*. 3; it has the cutters fixed at the different points 7, 7, 7, 7, of its circumference; thefe these are six in number at each side, and are formed with cutting edges similar to gouges or scoops (see *fig.* 7.); at the two opposite points, 4 and 5, it has small planes fixed in its rim, as shewn separate in *figs.* 4 and 5: when this wheel revolves, its cuttters will cut away all which projects above the plane of their motion; the wood is carried under them with a progressive motion, upon two moveable carriages E E and E E, one at each side of the wheel, and moving in opposite directions; they traverse upon iron beds, or railways F, F, which are more than double the length of the carriages: these are supported on iron legs, from a foundation of masonry, and well united together by cross pieces D, D, to keep them always in one plane, for upon this circumstance the truth of the planing depends. The pieces of wood to be planed are fixed down upon the carriages at G, G, and held firmly by screw-clamps with proper contrivances; the machine is then put in motion, and at the same time that the wheel is revolving the carriages are both drawn in opposite directions beneath its cutters, which soon clears away the wood to a perfect plane, by making successive strokes obliquely across the wood, and as the carriages advance these strokes proceed in succession from one end of the piece to the other. The gouges 7, 7, act first to chop, or hew away the wood roughly, but to a flat surface, and then the planes 4, 5, follow and reduce it to a smooth plane: this is accomplished by their being placed rather nearer the centre, so that they revolve in a rather smaller radius, and thus act upon the wood after the gouges have finished. We shall now enter more minutely into the details of the machinery: the two carriages E, E, are put in motion alternately, by means of an endless chain H H, which is extended between two horizontal wheels K, I; the centre pin of the latter is fixed in a piece of wood *d*, fitted in a groove formed between the two adjacent rails F, F, on which the carriages run; the slider has a screw *b*, by which it is forced outward, and thus strains the chain between the two wheels so tight, that when the wheel K is turned round, it will draw the chain, which being connected with the carriages beneath, gives them both a progressive motion. The wheel K is fixed upon a short vertical axis, upon the lower end of which is a pinion L, having its teeth engaged with a rack M, attached to the piston-rod of a cylinder 10, situated horizontally on the ground (see also *fig.* 10. *Plate* II.): the piston-rod, M, is fitted through a stuffing-box, *e*, at the end of the cylinder, and the piston, *f*, is fitted accurately to the chamber with leathers, to make it perfectly water-tight: the cylinder is bolted fast down upon the floor framing, as shewn in both figures, and pipes *g*, *h*, enter into it at each end, for the purpose of introducing or returning water, which acts upon the piston *f*, to give it an advancing or retrograde motion, upon the hydrostatic principle invented by Mr. Bramah, and described at the end of our article Machinery; see also Press, *Hydrostatic*. The steam-engine which gives power to the whole machine also works a small forcing pump, or injector, which is constantly pumping water into an air-vessel, under a great pressure: from this small copper pipes are conducted to the machine, to operate, when required, either in the cylinder 10, or in another, which is the step, or support of the main vertical shaft, and gives the means of raising or lowering it with the wheels and cutters all together, to cause them to reduce the wood upon the bench to any required thickness. The admission of the water into these cylinders is regulated by cocks, situated at one side of the machine, in a position where a person can, at the same time, manage them, and have a complete view of all the machine, to watch its operation. The relative position of these cocks is shewn in *fig.* 8, where that for the service of the cylinder is marked N, and the other for regulating the thickness is marked O, and *i* is the pipe leading from it to the bottom of the cylinder 13; the cocks themselves are shewn on a large scale in *figs.* 11 and 12: the entry pipe, which brings the water from the injector, is here plainly shewn, with two branches leading to the cocks. From the cock N, a passage directly opposite to the entry leads to the waste, or escape-pipe; and on the two opposite sides, at right angles to the former, are pipes *g* and *h*, leading to the front and back of the cylinder: the cock itself has two curved passages through it, which will make communication with any two adjacent pipes of the four; thus, as it stands in the figure, the water from the entry passes to the back of the cylinder, whilst the water contained in the front end is at liberty to escape at the waste pipe. In this situation the piston is moved towards the front end of the cylinder, and turning round the pinion and wheel K, (*figs.* 1 and 2.) moves both carriages in one direction: now by turning the cock N a quarter of a revolution in either direction, the same passages make a different communication, *viz.* from the entry to the front of the cylinder, and from the back to the waste; this throws the action upon the front side of the piston, drawing it to the back end of the cylinder, and moving the carriages in an opposite direction. By turning the cock only ⅛th instead of ¼th, all the four passages are close stopped, and no motion takes place. The other cock, O, is more simple; thus, the entry is on one side, the pipe *i* at right angles to it, and the waste opposite the latter; the passage in the turning part of the cock is made diametrically through it, and another at right angles into it. In the position of the drawing, the pipe, *i*, is open to the waste, and permits the water in the cylinder 13 (*fig.* 8.) to escape; but when the cock is turned round one-fourth, to bring the short passage opposite the pipe *i*, a fresh supply of water will be admitted from the entry into the cylinder 13, or, by turning a little farther, all of them are shut. The cylinder marked 13 (*fig.* 8.) is fixed by screws in the middle of one of the cross bars D; it is accurately bored withinside, and fitted with a piston P, (see also *fig.* 13.) which is packed with leather cups, so that no leakage can take place by the side of it; in the upper side of the piston is a perforation for the reception of a steel pivot, which is fixed in the lower end of the great vertical spindle A, and thus supports its weight as it revolves; the upper end, *a*, of the great spindle is fitted through the centre of the cog-wheel, B, with a fillet, so that it has free liberty to rise and fall, but cannot turn round without the wheel; the wheel itself is supported by means of a cone formed on the lower part of it, and fitted into a socket supported at the top of four iron standards Q, Q, which are erected from the iron framing below, and thus they sustain the axis and wheel very firmly from the same frame as the rails F, F, which support the carriages. At the top of the vertical spindle a shackle, *a*, is fitted, by a pin with a head, inserted into the end of the axis, and retained by a cross pin; by this means the shackle is united to the spindle, to rise and fall with it, but not to revolve with it; a chain is attached to the shackle, and passes over a pulley, as shewn at *m*, in *fig.* 2, and thence to a small pulley *n*; to this is attached a larger wheel, *o*, from which a chain is carried, to suspend a heavy wooden ruler *p*, situated at some distance from the machine, and sliding in a groove; it has divisions shewing inches and parts graduated upon it, which are determined by an index fixed to the wood of the groove. On this scale, those divisions which are marked inches are three times that length, because the wheels *n* and *o* are as three to one in diameter:

meter: this ſcale ſhews the thickneſs to which the machine will reduce the wood upon the carriages, the index being ſo adjuſted that it ſtands at zero of the ſcale when the wheel 3 3 is lowered down till its cutter cuts the ſurface of the carriage; then by turning the cock N, the water is very gradually admitted into the cylinder 13, and elevates the piſton P, the ſhaft, and wheel altogether, to any required height above the bench, which is ſhewn in inches and parts by the ſcale to very great accuracy; for by the cock being very partially opened, the wheel riſes ſo ſlowly, that it can be adjuſted to the greateſt nicety. The wheels *n* and *o* are ſupported in the floor above the room, as is alſo the frame for the ſupport of the axis, C, of the live and dead pulley *c*; the endleſs ſtrap of this pulley is guided through an eye at the end of an iron rod *s*, *fig.* 8, which is joined to a lever T, coming down in reach of the attendant, who alſo manages the cocks N, O.

The conſtruction of the cutters is ſhewn in *fig.* 7: here 3 is a ſection of a part of the rim of the wheel, and *t* an iron clamp ſcrewed faſt down upon it, as ſhewn in *fig.* 3; the clamp has a vertical mortiſe through it for the reception of the ſtem of the gouge cutter 7, which is fixed faſt therein by a wedge piece and ſcrew *v*: by this means they can all be adjuſted till their edges come exactly into one plane, though not quite ſo deep as the faces of the planes: theſe are made, as ſhewn in *figs.* 4 and 5, in iron, being received into an opening in the rim of the wheel, and held faſt by two bolts, *w*, *w*, with keys above the ſurface of the wheel to keep them faſt; the plane iron, *x*, is double, and fixed into its place by an iron wedge *y*, formed ſimilar to that of a carpenter's plane.

It only now remains for us to explain the conſtruction of the dogs or claws for holding the work faſt down upon the benches E, E; theſe are of two kinds, ſome fixed on the outſides of the carriage, and others in the middle, which draw up by ſcrews to hold the wood faſt; the carriage is compoſed of two large beams E, E, *fig.* 9, which is a croſs ſection of it; theſe are united by proper croſs pieces, and run upon the rails F, F, with metal pieces fixed on the lower ſides of them. There are alſo ſeveral caſt-iron frames fixed acroſs, as ſhewn by the dark ſhaded parts *k*; each conſiſts of two cheeks, all formed from one piece, and leaving a groove between them; in this groove a long ſcrew, *l*, is fitted by a collar at one end, and operates upon a ſlider, 8, fitted into the groove; a dog marked *z*, and bent ſomething like an S, is attached to this ſlider, and projects above the bench, having a ſharp point which penetrates the wood 2 G, and forces it againſt the other claws, *r*, *r*, fixed on the outſides. When the wood, as G, *fig.* 9, is of ſmall ſize, another ſmall claw, 9, is applied; this is ſcrewed into a nut of braſs, which is fitted into the groove, then a ſecond piece of wood, 2, is applied between it and the dog *z*, to tranſmit the force of the ſcrew, *l*, to the other one at 9: the outſide claws, *r*, are formed on the top of ſquare ſtems, which are fitted through clamps affixed to the ſides of the carriages, as ſhewn in *fig.* 6, and provided with clamp ſcrews, by which they can be fixed at any required height. The dogs *z* are very ſimply attached to the nut 8, by being applied upon the flat top ſurface of it, and one point enters into a ſmall hole made in the fore part of the nut 8; by this means it is ſimply hooked into its place, and when the ſcrew is turned, it cannot get looſe; another advantage is, that the clamp may be reverſed, or turned the other way, and then the ſcrew can be employed to hold the wood between *z*, and the claws, *r*, of the oppoſite ſide of the carriage. By theſe means the bench will hold a large piece of wood of the full width of the bench, or by introducing one of the clamps, 9, between each piece, it will hold as many narrow ones as will make up the width, and they will be all planed together to one ſurface.

The endleſs chain H, which gives motion to the carriages, is connected with them by means of a piece of wood H, *fig.* 9, projecting down from it, and divided into two halves, between which the chain can be clamped or jambed faſt when they are drawn together by a ſcrew 6; therefore, by relieving this ſcrew, the two halves open ſo much, as to permit the chain to ſlide freely between them; in this caſe the carriage will ſtand ſtill. This expedient is uſed when it is required to have one carriage diſengaged, for, in general, both are uſed together, in the following manner; ſuppoſe both carriages at the ends of their reſpective rails, the wood is laid upon them, and by the ſcrew 6, which is turned with a winch, it is clamped faſt on the chain. If the wood is winding, or irregular, it is made up at firſt by wedges, till its upper ſurface is parallel to the bench, and it is then fixed by the ſcrews *l*; the carriages are then engaged with the chain, by turning the handle of the ſcrew 6, which for that purpoſe comes to the outſide. Next the cock O is turned one way or the other, to raiſe or lower the cutter, till the gauge, *p*, ſhews it to be at the thickneſs the ſtuff is to be planed to. All being thus prepared, the handle of the lever, T, is drawn; this draws the ſtrap upon the live pulley *c*, and puts the machine in motion, and having acquired its full velocity, the ſame perſon turns the other cock N, and gently opens it; this puts the carriages in motion, and he can, by regulating the handle of the cock, give it any velocity he wiſhes; he can bring it up very quick, till the work comes under the cutters, and then move it very ſlowly, if much wood is to be reduced, or quicker when but little is to be taken off. In this manner the planing is performed from one end of the piece to the other, and the ſucceſſive ſtrokes of the cutters and planes follow each other ſo cloſely, as to leave an even ſurface, and with only ſuch very ſlight ſcores acroſs it, that the leaſt ſhaving of a ſmoothing plane afterwards finiſhes it, from the rougheſt and moſt irregular timber which can be found.

In 1803, Mr. Bevans obtained a patent for a machine which we have ſeen at work for planing (or *ſticking*, as the joiners term it) all kinds of mouldings or rebates, and ploughing grooves, as well as forming flat ſurfaces of ſmall breadth, which it does with very little labour: in this machine, theſe operations are performed by the planes commonly uſed for ſimilar purpoſes, with only ſuch alterations as are neceſſary to adapt them to the machinery by which they are put in motion with mechanical power inſtead of human labour; they are to be uſed either ſingly, or combined together in any number, according to the width of the boards to be worked at once, and the nature of the work to be done, ſo as to plane up at one operation ſuch moulding as joiners work up by uſing ſeveral planes ſucceſſively for the different parts; this is effected by a kind of frame or box, which admits of fixing any number of planes in it, ſide by ſide, and at any diſtance aſunder, to form the compound moulding required. The work is fixed faſt on a bench, and the box of planes is made to paſs over it, in the direction of its length, by a connecting rod communicating at one end with the box or frame containing the planes, and at the other end with machinery capable of affording a reciprocating motion.

This machinery conſiſts of a crank, whoſe radius muſt be nearly half the length of the required ſtroke, and muſt be regulated accordingly: this regulation is effected by the arm of the crank paſſing through a mortiſe in a ſtrong box, fixed on an axis, and ſliding in the ſaid box to any required length, where it muſt be fixed by ſtrong ſcrews, the axis being turned by manual exertion, by horſes, ſteam, water, or any

 other

other power, and having its motion regulated by a fly-wheel.

The planes are loaded, to keep them in contact with their work, by a long beam of wood, fet up on end upon the fides of the box, and connected therewith by being divided into two cheeks, which at the lower fides are formed to an arc of a circle, and united to the box by chains, in the fame manner as the beams of fteam-engines are connected with their pifton-rods. The upper part of the beam is made to pafs always through one point by fliding between friction-wheels, or otherwife in a tube hung on two pivots perpendicularly over the centre of the work, and at fuch heights as may be moft convenient for the length of the ftroke required: the connecting-rod from the crank before mentioned is jointed to the upright beam, near its lower end, and by this means the motion is given to the box of planes, the chains and arches at the bottom allowing it in all pofitions to preferve the plane horizontal. To guide the box of planes in a rectilinear motion, and alfo to bear them off when they have been reduced to the depth required, fences are ufed, which are irons fliding perpendicularly in tubes or fockets in the box or frame, and clipping a tongue, or ruler fixed in the direction of the required ftroke, in the frame fupporting the bench.

PLANISPHERE, a projection of the fphere, and the feveral circles thereof, on a plane; as upon paper, or the like.

In this fenfe, maps of the heavens and the earth, in which are exhibited the meridians, and other circles of the fphere, are called planifpheres. See PROJECTION.

PLANISPHERE is fometimes alfo confidered as an aftronomical inftrument, ufed in obferving the motions of the heavenly bodies; confifting of a projection of the celeftial fphere upon a plane, reprefenting the ftars, conftellations, &c. in their proper fituations, diftances, &c. Such is the aftrolabe, which is a common name for all fuch projections.

In all planifpheres, the eye is fuppofed to be a point viewing all the circles of the fphere, and referring them to a plane on which the fphere is as it were flattened. This plane is called the *plane of the projection.*

A perfpective plane is only a plane of projection placed between the eye and the object, fo as to contain all the points which the feveral rays drawn from the object to the eye imprefs thereon. But in planifpheres or aftrolabes, the plane of the projection is placed beyond the object, which is the fphere. The plane of the projection is always one of the circles of the fphere.

Among the infinite number of planifpheres which the different planes of projection, and the different pofitions of the eye, would furnifh, there are two or three that have been preferred to the reft. Such are that of Ptolemy, where the plane of projection is parallel to the equator; that of Gemma Frifius, where the plane of projection is the colure, or folftitial meridian, and the eye the pole of the meridian; that of John de Royas, a Spaniard, whofe plane of projection is a meridian, and the eye placed in the axis of that meridian, at an infinite diftance. This laft is called the analemma.

The common defect of all thefe projections is, that they diftort and alter the figure of the conftellations, fo that it is not eafy to compare them with the heavens; and that the degrees in fome places are fo fmall, that they afford no room for operation.

All thefe faults M. de la Hire has provided againft in a new projection, or planifphere; where it is propofed the eye fhall be fo placed, as that the divifions of the circles projected fhall be fenfibly equal in every part of the inftrument. The plane of his projection is that of a meridian.

PLANISPHERE, *Nautical.* See NAUTICAL.

PLANITZ, in *Geography*, a town of Saxony, in the circle of Erzgebirg; three miles S. of Zwickau.

PLANK, a general name for all timber, excepting fir, which is from one inch and a half to four inches thick: if of lefs dimenfions it is called *board.*

PLANK, *Garboard.* See GARBOARD.

PLANK-*Hook*, is a pole with an iron-hook at its end, with which the navigators fhift their runs or wheeling-planks, as occafion requires.

PLANK-*Piling*, the fame with *Camp-fheeting;* which fee.

PLANK-*Sheers*, or *Plan-Sheers*, the pieces of plank wrought horizontally over the heads of the timbers of the forecaftle, quarter-deck, and round-houfe, for the purpofe of covering the top of the fide; hence fometimes called *covering-boards.*

PLANKENBERG, in *Geography*, a town of Auftria; four miles S.S.W. of Talla.

PLANKENSTEIN, a town of the duchy of Stiria; four miles S. of Windifch Weiftritz.

PLANKENWARD, a town of the duchy of Stiria; eight miles W. of Gratz.

PLANKING, in *Ship Building*, covering the timbers of a fhip with plank; fometimes quaintly called *fkinning.*

PLANO-*Concave Glafs*, or *Lens.* See LENS.

PLANO-*Convex Glafs*, or *Lens.* See LENS.

PLANSCHWITZ, in *Geography*, a town of Saxony, in the Vogtland; three miles W. of Oelfnitz.

PLANT, in *Botany*, *Gardening*, &c. See PLANTS.

PLANT, *Burning thorny*, a fpecies of *Euphorbia;* which fee.

PLANT, *Egg*, a fpecies of *Solanum;* which fee.

PLANT, *Ice.* See MESEMBRYANTHEMUM.

PLANT, *Parafitical.* See PARASITE.

PLANT, *Senfitive*, is the Englifh name of a diftinct genus of plants, called by botanifts *Mimofa;* which fee.

PLANT, *Baftard fenfitive.* See ÆSCHYNOMENE.

PLANT, *To*, in *Military Language*, is to place or fix, as, *e.g.* to plant a ftandard. It likewife fignifies to arrange different pieces of ordnance for the purpofe of doing execution againft the enemy or his works; as, *e.g.* to plant a battery.

PLANTA, in *Anatomy*, the loweft part, or fole of the foot of a man, comprehended between the tarfus and the toes.

PLANTAGENET, in *Hiftory*, an addition, or furname, borne by many of our ancient kings.

The term plantagenet has given infinite perplexity to the critics and antiquaries, who could never fettle its origin and etymology.

It is allowed that it firft belonged to the houfe of Anjou, and was brought to the throne of England by Henry II. where his male pofterity preferved it till the time of Henry VII., a fpace of above four hundred years.

It is difputed, who it was that firft bore the name. Moft of our Englifh authors conclude, that our Henry II. inherited it from his father Geoffrey V., earl of Anjou, fon of Fulk V., king of Jerufalem, who died in 1144. This Geoffrey they will have the firft of the name; and our Henry II. the iffue of Geoffrey, by Maud, only daughter of Henry I. the fecond.

Yet Mahege will not allow Geoffrey to have borne the name; and adds, that, in effect, the old annalift of Anjou, J. Bourdigne, never calls him fo. The firft, Manege adds, to whom he gives the appellation, is Geoffrey, third fon of this Geoffrey V.

Yet muft the name be much more ancient than either of thefe princes, if what Skinner fays of its origin and etymology

logy be true. That author tells us, that the houfe of Anjou derived the name from a prince thereof, who, having killed his brother to enjoy his principality, took to repentance, and made a voyage to the Holy Land to expiate his crime; difciplining himfelf every night with a rod made of the plant genêt, genifta, broom; whence he became nicknamed *Planta-genêt*.

Now it is certain that our Geoffrey made the tour of Jerufalem; but then he did not kill his brother, nor did he go thither out of penance, but to affift king Amauris his brother. Who then fhould this prince of the houfe of Anjou be? Was it Fulk IV? It is true he difpoffeffed his elder brother Geoffrey, and put him in prifon; but he did not kill him; nay, Bourdigne obferves, he was even releafed from the fame prifon by his fon Geoffrey V., already mentioned.

Farther; this Fulk did make a journey to Jerufalem; and that, too, partly out of a penitental view: we are affured, by Bourdigne, he did it out of apprehenfion of the judgments of God, and eternal damnation, for the great effufion of Chriftian blood in the many mortal battles he had been in. The annalift alfo adds, that he made a fecond voyage; but it was to return God thanks for his mercies, &c.; to which we may add, that Fulk was never called Plantagenet; fo that what Skinner advances appears to be a fable.

There is another common opinion, which appears no better founded; and it is this: that the name Plantagenet was common to all the princes of the houfe of Anjou after Geoffrey V., whereas, in fact, the name was only given to a few, and that, as it fhould feem, to diftinguifh them from the reft. Thus Bourdigne never applies it to any but the third fon of Geoffrey V. and diftinguifhes him, by this appellation, from the other princes of the fame family. Though it is certain that it was likewife given to the elder brother, Henry of England, as before obferved.

PLANTAGINELLA, in *Botany*, is Vaillant's name for the *Limofella*; fee that article.

PLANTAGINES, the fecond order of Juffieu's feventh clafs, for the characters of which clafs fee NYCTAGINES. The *Plantagines*, or *Plantagineæ*, as Juffieu now terms them, in which he is followed by Mr. Brown, Prodr. Nov. Holl. v. 1. 423, are thus defined.

Calyx moftly in four deep fegments. *Tube* petal-like, contracted at the fummit, and generally four-cleft, refembling a *corolla*, but withering and not deciduous, inferior. (This "*tube*" is the Linnæan *corolla*.) *Stamens* four; their filaments long, prominent, inferted into the bottom of the "tube." *Germen* folitary; *ftyle* one; *ftigma* fimple. *Capfule* divided circularly, of one or two cells, with one or more feeds in each cell. *Perifperm* (or *albumen*) none. *Plants* herbaceous. *Sexes* fometimes in diftinct individuals.

Juffieu's genera of this order are *Pfyllium*, *Plantago*, and *Littorella*. The two firft are combined by Linnæus, as well as by Decandolle and Brown. The latter author defcribes an albumen of the fhape of the feed, and of a denfely flefhy texture. He remarks that the analogy between the fuppofed *corolla* of the *Plantagineæ* and the membranous tube, which connects the *ftamens*, in the neighbouring order of *Amaranthaceæ*, or *Amaranthi*, is weakened by the prefence of the fame part in the female flower of *Littorella*, a monoecious genus. We would obferve however, though by no means inclined to invalidate the opinion of the part in queftion being a real *corolla*, that barren filaments are often found in female flowers, and therefore any other organ relating to the *ftamens*, may likewife be prefent in fuch, while the *ftamens* themfelves are abfent. See LITTORELLA and PLANTAGO.

PLANTAGO, the herb Plantain, feems moft probably to have been fo named in ancient times, either from its refemblance to the fole of the foot, *planta*, in flatnefs, breadth, and lines or furrows; or from the depreffed trodden appearance of fome of the moft common fpecies, particularly *P. media*. Such is nearly the explanation of Ambrofinus, Ray, and the lexicographers. Linnæus, in Phil. Bot. 167, has "*Plantago, planta tangenda*." "A bold etymology," fays De Theis, who, neverthelefs, leaves as he finds this derivation, without fearching further. Linn. Gen. 57. Schreb. 77. Willd. Sp. Pl. v. 1. 641. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 182. Prodr. Fl. Græc. Sibth. v. 1. 99. Brown. Prodr. Nov. Holl. v. 1. 424. Purfh v. 1. 98. Ait. Hort. Kew. v. 1. 250. Juff. 90. Tourn. t. 48. Lamarck Illuftr. t. 85. Gærtn. t. 51. (Coronopus; Tourn. t. 49. Pfyllium; Tourn. t. 49. Juff. 90.)—Clafs and order, *Tetrandria Monogynia*. Nat. Ord. *Plantagines*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in four deep erect fegments, fhort, permanent. *Cor.* of one petal, membranous, permanent, withering; tube fwelling in the middle; limb depreffed, in four deep, ovate, acute fegments. *Stam.* Filaments four, capillary, erect, extremely long, inferted into the tube, alternate with the fegments of the limb; *Brown*; anthers rather oblong, moftly beaked or crefted, incumbent. *Pift.* Germen fuperior, ovate; ftyle threadfhaped, half the length of the ftamens, ftigma fimple, acute. *Peric.* Capfule ovate, fomewhat membranous, of two or four cells, burfting by a tranfverfe circular fiffure, the partition at length becoming unconnected. *Seeds* feveral, oblong, convex on one fide, concave on the other.

Obf. In fome fpecies the calyx is equal, in others unequal. Mr. Brown remarks that *P. Coronopus* has four cells to the capfule, with one feed in each cell. Gærtner, without mentioning the number of cells, fays there are four feeds in each cell, in that fpecies. Tournefort made *Coronopus* a diftinct genus, merely on account of the deep fegments of the foliage. It is rather to be wifhed that *Pfyllium* of authors could have been retained, as there are feveral fpecies of that fuppofed genus, and their branched leafy habit is very different from what is ufual in *Plantago*. Juffieu thought to diftinguifh *Pfyllium* by having folitary feeds, but the fame is the cafe with many indubitable fpecies of *Plantago*, as *P. Bellardi*, *cretica*, *media*, and others. For the difficulties attending the true nature of the corolla, fee PLANTAGINES.

Eff. Ch. Calyx four-cleft. Corolla four-cleft, inferior, membranous; its limb reflexed. Stamens very long. Capfule with two cells, burfting all round.

The fourteenth edition of Linn. Syft. Veg. enumerates twenty-four fpecies of *Plantago*; Willdenow has thirty-three, to which one is to be added from the Prodr. Fl. Græc., four from Mr. Brown's Prodr. Nov. Holl., and five from Mr. Purfh's American Flora. The genus is divided into two very unequal fections, of each of which we fhall give fome examples, particularly mentioning the five Britifh fpecies. The new ones all belong to the firft fection.

Sect. 1. *Stem none. Flower-ftalks naked.* Thirty-fix fpecies in all.

P. *major*. Greater Plantain. Linn. Sp. Pl. 163. Willd. n. 1. Curt. Lond. fafc. 2. t. 11. Engl. Bot. t. 1558. Fl. Dan. t. 461. Camer. Epit. 261. (P. media; Matth. Valgr. v. 1. 435. P. latifolia; Ger. Em. 419.)—Leaves ovate, fmoothifh, fomewhat toothed, with longifh footftalks. Stalk round. Flowers imbricated. Seeds numerous.

merous.—Common every where throughout Europe, as well as in North America, flowering at almost all seasons, in mild weather. *Root* perennial, of many long fibres. *Leaves* radical, several, upright or spreading, on channelled ribbed *footstalks*, ovate, broad, toothed or waved, nearly smooth, with seven or nine longitudinal ribs. *Stalks* several, erect, longer than the leaves, each bearing a dense cylindrical *spike*, of innumerable crowded, small, whitish *flowers*, with purple *anthers*. *Stigma* downy. *Capsule* elliptical, small, each cell containing several *seeds*, which are the food of small birds, and are often given to those kept in cages. This species is subject to many varieties, one of which we suspect to be *P. crassa*, Willd. n. 2.

P. *asiatica*, Linn. Sp. Pl. 163, has the appearance of *major*, but is more slender, with scattered *flowers* and angular *stalks*.—*P. maxima*, Willd. n. 3. Jacq. Ic. Rar. t. 26, is intermediate between the foregoing and the following.

P. *media*. Hoary Plantain. Linn. Sp. Pl. 163. Willd. n. 5. Curt. Lond. fasc. 4. t. 14. Engl. Bot. t. 1559. Fl. Dan. t. 581. Camer. Epit. 262. (P. major; Matth. Valgr. v. 1. 436. P. incana; Ger. Em. 419.)—Leaves ovate, downy, depressed, with very short footstalks. Stalk round. Spike cylindrical. Seeds solitary.—Common on open hills and pastures, where the soil is chalky or gravelly, flowering throughout summer. The broad depressed *leaves* are very conspicuous, and considered as a great blemish by those who are curious about their grass-plats. A single drop of oil of vitriol on the crown of each root is said to prove the best and most certain mode of destroying these intruders. The *spikes* are much thicker and shorter than those of *major*. The white *corolla*, pink *stamens*, and yellow *anthers*, make a far from inelegant appearance.

P. *lanceolata*. Ribwort Plantain. Linn. Sp. Pl. 164. Curt. Lond. fasc. 2. t. 10. Engl. Bot. t. 507. Mart. Rust. t. 67. (P. longa; Matth. Valgr. v. 1. 437. P. quinquenervia; Ger. Em. 422.)—Leaves lanceolate, entire, acute at each end. Spike ovate. Stalk angular.—Extremely frequent throughout Europe, in pastures and waste ground, flowering in summer. The more elongated, erect, narrower, greener *leaves*, with three or five ribs, and the short *spike*, the *calyx* of whose *flowers* is black, *corolla* brownish, and *anthers* white, mark the plant sufficiently. The entire *leaves* afford a less ambiguous specific distinction than the naked *spike*, by which Linnæus meant to discriminate between this and *P. Lagopus*; for the *lanceolata* has a bracteated, though not a hairy *spike*, while *Lagopus* has a hairy one without *bracteas*.

P. *Lagopus*. Hare's foot Plantain. Linn. Sp. Pl. 165. Willd. n. 10. Ait. n. 10. Sm. Fl. Græc. Sibth. t. 144.—Leaves lanceolate, five-ribbed, distantly toothed. Spike ovate, hairy. Stalk round, clothed with upright hairs.—Native of the south of Europe, in dry open places; very common in Greece and the Archipelago.—*Root* perennial. Habit and size like the last, but the leaves are distinguished by their neat, prominent, more or less distant teeth. The *spikes* are shorter, rounder, hairy and pale. *Anthers* more obtuse.

P. *albicans*. Woolly Plantain. Linn. Sp. Pl. 165. Willd. n. 13. Ait. n. 12. Sm. Fl. Græc. Sibth. t. 145. (Holosteum salamanticum; Ger. Em. 423.)—Leaves lanceolate, oblique, waved, villous. Spike cylindrical, rather lax. Stalk round, longer than the leaves.—Native of Spain, the south of France, the Peloponnesus, and some of the Greek islands, but not common. It is perennial, flowering in summer. The divided leafy crown of the *root* sometimes assumes the appearance of short stems. The *leaves* are long and narrow, spreading in an arched manner, not depressed; their surface glaucous, besprinkled with fine soft hairs. *Stalks* very hairy, especially when they first spring forth. *Spikes* long and slender, the *flowers* rather distant. *Bracteas* and *calyx* green, edged with white, hairy at the back. *Corolla* brown. *Stamens* red. *Anthers* yellow, with a small sharp beak. *Style* hairy.

P. *alpina*. Alpine Plantain. Linn. Sp. Pl. 165. Willd. n. 15. Ait. n. 14. Jacq. Hort. Vind. v. 2. 58. t. 125.—Leaves linear, flat. Stalk round, hairy. Spike oblong, erect.—Native of the Alps of Switzerland and Austria. Dr. Sibthorp found it about the summit of the Bithynian Olympus. The *root* is perennial. *Leaves* long and narrow, with taper points; the edges often fringed. *Stalks* hairy. *Spike* rather cylindrical than ovate. *Anthers* yellow, with a blunt beak. *Style* hairy. The Plantain noirâtre of Reynier, an alpine plant, with a short ovate dark *spike*, often mistaken for this, seems rather, as professor Schrader has hinted to us, a variety of *lanceolata*.

P. *Bellardi*. Bellardian Plantain. Allion. Pedem. v. 1. 82. t. 85. f. 3. Willd. n. 16. Ait. n. 15. Sm. Fl. Græc. Sibth. t. 146. (Holosteum, sive Leontopodium creticum alterum; Ger. Em. 424.)—Leaves linear-lanceolate, hairy, flat. Stalk round, villous. Spike cylindrical. Bracteas pointed.—Found in Spain, Italy, Barbary, and on the summit of the Bithynian Olympus, as soon as it is clear of snow. The *root* is annual, erroneously marked perennial in Prodr. Fl. Græc. *Leaves* numerous, spreading, either quite entire, or toothed near the point. *Stalks* rigid, erect or ascending, two or three inches long, numerous, clothed with horizontal hairs. *Spike* thick, hairy, with prominent pointed *bracteas*. *Corolla* tawny, taper-pointed. *Anthers* yellow, with a pale two-lobed crest as large as their cells.

P. *cretica*. Cretan Plantain. Linn. Sp. Pl. 165. Willd. n. 17. Ait. n. 16. Sm. Fl. Græc. Sibth. t. 147. (Holosteum, sive Leontopodium creticum; Ger. Em. 424.)—Leaves linear, flat, hairy. Stalk woolly, very short. Head of flowers roundish, drooping.—Native of Crete and Cyprus. A small annual species, remarkable for its numerous, short, deflexed, very hairy *stalks*. The *flowers* form a head, not a spike. The *corolla* is yellow, with a purple eye, its segments broader and shorter than in the last. *Anthers* similar to *P. Bellardi*, except that their crest appears to consist of one lobe only.

P. *maritima*. Sea Plantain. Linn. Sp. Pl. 165. Willd. n. 19. Ait. n. 17. Pursh n. 10. Sm. Fl. Græc. Sibth. t. 148. Engl. Bot. t. 175. (Coronopus; Ger. Em. 425. C. sylvestris; Matth. Valgr. v. 1. 449. P. marina; Ger. Em. 423.)—Leaves linear, channelled, nearly entire. Spike cylindrical, close. Stalk round, longer than the leaves.—Native of muddy sea-shores in Europe and North America, as well as of mountain rocks.—*Root* long, perennial. *Herb* extremely various in size and luxuriance. *Leaves* copious, spreading, linear, channelled, dark green, rather fleshy, occasionally hairy; their margins either quite entire, or sometimes beset with a few irregular teeth. On mountains they are generally narrowest and most entire. *Flower-stalks* few, ascending, about twice as long as the foliage, rather hairy. *Spike* slender, of numerous crowded or imbricated *flowers*. *Corolla* whitish. *Anthers* with a little sharp beak. *Style* downy. The structure of the *flowers* most agrees with *P. albicans*. The ripe *fruit* we have never examined. This species being, like the Thrift, *Statice Armeria*, found on the loftiest mountains, as well as on the sea-shore, its small alpine varieties have been taken for

alpina,

alpina, or confounded with *subulata*, neither of which are really known to be natives of Britain.

P. *subulata*. Awl-leaved Plantain. Linn. Sp. Pl. 166. Willd. n. 20. Ait. n. 18. (Serpentina omnium minima; Lob. Ic. 439. f. 2. Coronopus sive Serpentina minima; Ger. Em. 426.)—Leaves awl-shaped, triangular, striated, rough-edged. Stalk round.—Native of the Swiss alps and the Bithynian Olympus, as well as of the coasts of the Mediterranean. Gerarde might have it in his garden, but we have never seen a garden specimen of this species. Its *root* is perennial, running down in one great cylindrical body to the depth of a foot, or more, and divided at the crown into many short leafy tufts. The *leaves* are very copious, from one to three inches long, readily known by their narrow, linear, acute, triangular form, and rough edges. *Flower-stalks* rather stout, hairy, not numerous. *Spikes* cylindrical, not always perfectly close, various in length, and number of *flowers*, which seem to resemble those of *P. maritima*, but we have not been able to investigate their *anthers*. The *bracteas* are hairy, as long, or longer, than the *calyx*.

P. *gentianoides*. Gentian-leaved Plantain. Prodr. Fl. Græc. n. 355.—Very smooth. Leaves ovate, three-ribbed, somewhat waved. Stalk round. Bracteas ovate, naked, shorter than the calyx.—Gathered by Dr. Sibthorp on mount Olympus, with the preceding. *Root* perennial, thick. *Leaves* very like *Gentiana acaulis*. *Stalks* three or four inches high, quite smooth and naked. *Spike* cylindrical, slender, scarcely an inch long, perfectly smooth in every part. *Bracteas*, as well as the *calyx*, obtuse and pointless.

P. *varia*. Variable New-Holland Plantain. Brown n. 1.—Hairy. Leaves lanceolate, three-ribbed, toothed; woolly, as well as the stalks, at the bottom. Spike many-flowered.—Native of various parts of New Holland without the tropic. *Brown*. It was sent us from Port Jackson, in 1793, by Dr. White. The *leaves* are three or four inches long, from half an inch to an inch wide, most tapering towards the base, or *footstalk*, which last is variable in length; both sides are clothed with dense short pubescence, and marked with three, occasionally five, longitudinal ribs; margin often beset with distant, very large and dilated, almost ovate, teeth, sometimes with obsolete ones, or none at all. *Flower-stalks* taller than the leaves, at least when full-grown, hairy, round, woolly at the base. *Spike* cylindrical, hairy, of rather numerous, but sometimes distant, *flowers*. *Bracteas* ovate, concave, rather smaller than the *calyx*. Segments of the *corolla* rounded, or broad-ovate. *Style* nearly smooth. This species seems in many points akin to *albicans*, and to *Serraria* and its allies, but very distinct, as a species, from all of them.

P. *debilis*. Weak New-Holland Plantain. Br. n. 2.—Leaves lanceolate, toothed or entire, three-ribbed, flaccid; beardless, as well as the thread-shaped flower-stalk, at the base. Lower flowers of the spike scattered.—Found by Mr. Brown at Port Jackson, New South Wales. Nearly akin to the foregoing.

P. *hispida*. Hispid New-Holland Plantain. Br. n. 3.—"Hairy and hoary. Leaves linear-lanceolate, toothed; beardless, as well as the flower-stalk, at their base. Spike of many imbricated flowers."—Native of the south coast of New Holland. *Br.*

P. *carnosa*. Fleshy New-Holland Plantain. Br. n. 4.—"Very smooth. Leaves lanceolate, deeply toothed, somewhat fleshy; naked, as well as the flower-stalk, at their base. Flowers from one to three."—Native of the island of Van Diemen. *Br.*

P. *Serraria*. Saw-leaved Plantain. Linn. Sp. Pl. 166. Willd. n. 23. Ait. n. 20. (P. apula laciniata bulbosa; Column. Ecphr. v. 1. 258. t. 259. P. angustifolia serrata hispanica; Barrel. Ic. t. 749.)—Leaves lanceolate, five-ribbed, with awl-shaped tooth-like serratures. Stalk round. Spike elongated, slender, cylindrical, imbricated. Bracteas taper-pointed.—Native of Italy, Barbary, Zante, and various parts of the Mediterranean and Archipelago. *Root* perennial, thick, so as to assume a bulbous aspect. *Leaves* numerous, acute, hairy, distinguished by their long, parallel, almost pectinate, teeth, in which they essentially differ from the broad rounded imbricated teeth of *P. macrorrhiza* of Vahl, Willd. n. 22. The *spikes* also are very much longer and more slender than those of that species, composed of innumerable crowded *flowers*, and longish taper-pointed *bracteas*.

P. *Coronopus*. Buck's-horn Plantain. Linn. Sp. Pl. 166. Willd. n. 24. Ait. n. 21. Fl. Dan. t. 272. Engl. Bot. t. 892. (Coronopus; Matth. Valgr. v. 1. 448. Cornu cervinum; Ger. Em. 427.)—Leaves linear, in many pinnate segments. Stalk round. Anthers with a lanceolate crest. Capsule of four cells. Common in gravelly soils, and on sandy sea-shores, throughout Europe. It is annual, flowering with us all summer long, and conspicuous for its depressed pinnatifid *leaves*, spreading, close to the ground, in a star-like form, whence originated one of its names, Star of the Earth. Some of the starved maritime varieties have more fleshy, and nearly undivided, *leaves*. *Spikes* various in length, pale. *Bracteas* pointed. *Anthers* tipped with a lanceolate membrane, or crest, akin to what is seen in *P. cretica*, Willd. n. 17. *Style* long, very hairy.

P. *Cornuti*, Jacq. Misc. v. 2. 351. Ic. Rar. t. 27. Willd. n. 26. Ait. n. 23, appears to us but a luxuriant variety of the last; its *stamens* indeed are shorter, and *style* rather longer; but there is hardly a distinct specific character to be discerned. It is pity that Jacquin did not examine the cells of the *capsule*. He merely says "fructus congenerum," which conveys nothing, in this case, that we want to know. If he had specified that the part in question agreed with all the rest of the genus, except *Coronopus*, it would have been decisive.

P. *Loeflingii*. Narrow Annual Plantain. Linn. Sp. Pl. 166. Willd. n. 25. Ait. n. 22. Jacq. Hort. Vind. v. 2. t. 126.—Leaves linear, with slender distant teeth. Stalk round. Spike ovate. Bracteas obtuse, with an orbicular membranous border.—Native of hills, and the borders of fields, in Spain and the south of France. No species is more distinct, or has been more mistaken, owing to Hudson and Linnæus having referred to this the toothed variety of *P. maritima*, figured in Petiver's English Herbal, t. 4. f. 9, and Ger. Em. 423. The *root* of *P. Loeflingii* is small, tapering and annual. *Plant* extremely variable in luxuriance. *Leaves* upright or spreading, linear, acute, very narrow, beset with fine, distant, taper teeth. *Stalks* spreading, thread-shaped, hairy, usually shorter than the foliage. *Spike* of few flowers, ovate, or almost capitate. *Bracteas* orbicular, concave, pointless, formed of a broad membrane, with a thick green keel. The *anthers* seem to have a membranous tip, but we have not seen them fresh, and Jacquin's figure has no dissected or magnified parts. He describes the *capsule* very accurately, of two cells, with one *seed* in each.

Sect. 2. *With a leafy stem.* Seven reputed species.

P. *amplexicaulis*, the first of these, Cavan. Ic. t. 125, appears a very doubtful species, perhaps allied to *albicans*, and certainly not more truly caulescent than some appearances of that plant. It is perhaps P. angustifolia lanuginosa incana,

 cana,

cana, Barrel. Ic. t. 750; a ſpecimen of which, from the ſouth of France, we have referred to *albicans*.

P. *Pſyllium*. Flea-bane Plantain. Linn. Sp. Pl. 167. Willd. n. 28. Ait. n. 25. Sm. Fl. Græc. Sibth. t. 149. Ehrh. Pl. Off. 271.—Stem branched, herbaceous. Leaves ſomewhat toothed, recurved. Heads leafleſs. Bracteas uniform, lanceolate, obtuſe.—Native of cultivated fields, vineyards, &c. in the ſouth of Europe, very common in Greece, being doubtleſs the real ψυλλιον of Dioſcorides. The *root* is annual. *Stem* round, downy, glutinous, leafy; if ſlightly branched, erect; if much ſubdivided, decumbent. *Leaves* oppoſite, ſeſſile, an inch or inch and half long, ſpreading, rather curved downward, linear-lanceolate, narrow, acute, flat, rough; tapering and entire at the baſe; ſparingly but ſtrongly toothed upwards. *Flower-ſtalks* axillary, ſolitary, round, rough, about the length of the leaves. *Heads* ovate, ſolitary, of ſeveral crowded *flowers*. *Bracteas* ovato-lanceolate, concave, blunt, rough at the keel, all uniform, and nearly of equal ſize. *Calyx* about as long as the bracteas, rough, obtuſe. *Corolla* pale browniſh-yellow, with pointed ſegments. *Anthers* with a ſhort membranous point. *Style* hairy. *Capſule* obtuſe, compreſſed, its circular fiſſure near the baſe. *Seeds* ſolitary in each cell. P. *Pſyllium*, Bulliard t. 363, in its large leafy *bracteas* and entire *leaves*, agrees beſt with *indica* of Linnæus.

P. *Cynops*. Shrubby Plantain. Linn. Sp. Pl. 167. Willd. n. 32. Ait. n. 29. (Pſyllium majus ſupinum; Bauh. Hiſt. v. 3. 513. Pſ. ſempervirens; Ger. Em. 587. Pſ. alterum; Matth. Valgr. v. 2. 414.)—Stem branched, ſhrubby. Leaves entire, thread-ſhaped, ſtraight. Bracteas orbicular, with linear points, much longer than the flowers.—Native of Provence, Italy, Switzerland and Bithynia. The *ſtem* is ſhrubby, and certainly perennial in our gardens, or rather greenhouſes. *Branches* and *heads* purpliſh; the latter diſtinguiſhed by their rounded membranous-edged *bracteas*, with linear rough points.

The cuts of old authors, given for the true *Pſyllium*, as Ger. Em. 587. f. 1. Matth. Valgr. v. 2. 413, and the modern plate of Bulliard, t. 363, having large *bracteas* under the heads of *flowers*, bear ſome reſemblance to *P. Cynops*, but better agree with the *indica*, Linn. Sp. Pl. 167, and are poſſibly, like that, but varieties of *Pſyllium*. The *afra*, Linn. Sp. Pl. 168, appears to us much more clearly a luxuriant, biennial, and ſomewhat ſhrubby, variety of *Pſyllium*, with which it preciſely agrees in every thing, but the more ſtout and ſhrubby habit of the *ſtem*.

P. *ſquarroſa*. Leafy-ſpiked Plantain. Willd. n. 29. Ait. n. 26. (P. ægyptiaca; Jacq. Ic. Rar. t. 28.)—Stem herbaceous, branched, diffuſe. Leaves linear, entire. Heads oblong. Bracteas leafy, elongated, rough.—Native of Egypt. This is a very diſtinct annual ſpecies, whoſe long recurved *bracteas* are rough to the edge, ſcarcely at all membranous. The *ſtyle* is rough, much longer and thicker, and perhaps more perfect, in ſome flowers than in others.

Plantago *Lanceolata*, ribwort plantain or ribgraſs, in *Agriculture*, has a perennial root, which, when old, appears as if bitten off at the end. The leaves are all from the root, truly lanceolate, diſtinguiſhed by five (ſometimes three or ſeven) prominent ribs, pointed, entire, or ſometimes having a few teeth near the baſe. According to Withering, in maritime ſituations they are toothed all along the edges. They are of a dark green, moſtly hairy beneath, taper at the baſe into a long flat footſtalk, ribbed like the leaf itſelf, and at their inſertion are inveſted with long white woolly hair ſpringing from the crown of the root. The ſcapes or flowering-ſtalks upright, longer than the leaves, from among which they ſpring; they are clothed at the baſe with the ſame kind of hair, and upwards are ſmoothiſh, round, with five deep furrows, ſlightly twiſted, and terminated by a ſhort ovate ſpike, imbricated with black ſcales, and enlivened with the prominent cream-coloured anthers, in its more advanced ſtate. A ſpike will ſometimes contain one hundred and thirty ſmall flowers crowded cloſe together, with an ovate pointed ſcale or bractea at the baſe of each. The capſule contains two oblong ſhining ſeeds, of an amber colour, in each cell. The ſtalks continue to grow after the flowering is over, and ſometimes ſhoot out to the length of two feet more. When it grows in meadows, the leaves are erect and drawn up: but in a dry barren ſoil they are ſhorter, broader, and more ſpread on the ground. It grows ſpontaneouſly in dry paſtures and other places, where it is often left untouched by cattle, to feed ſmall birds with the copious produce of its ſeeds. It has often been conſidered as a weed, occupying the room of graſſes, and other uſeful herbs; but has lately been introduced into culture as a good food for ſheep, or to be made into hay for cattle in general. Haller has attributed the richneſs of the milk in the alpine dairies, in ſome meaſure, to this plant. And it has been remarked by Linnæus, that it has been eaten by horſes, ſheep, and goats, but that cows refuſe it. Sheep, however, will eat it either green or dried, provided it be well gotten; but it does not anſwer for paſturage, without a mixture of clover or graſſes, according to ſome cultivators. Withering ſuggeſts that the total abſence of this plant, in marſhy lands, is a certain criterion of their wretched quality. In proportion as ſuch ſoils are improved by draining, it will flouriſh and abound. But others have ſuggeſted, that in this climate the produce of this plant is not a criterion of excellence in ſoil, but merely of its dryneſs. But though botaniſts do not ſpeak favourably of this plant as a paſture or meadow herb, practical farmers hold it in a degree of eſteem. And it has been aſſerted by Mr. Zappa of Milan, that it grows ſpontaneouſly in every meadow of Lombardy, eſpecially in thoſe which are irrigated; that it vegetates early, flowers at the beginning of May, ripens in five weeks, and is cut with the *poa trivialis*; that the height of the leaves is about one foot, and of the ſtalk a foot and a half; that it multiplies itſelf much by the ſeed and a little by the roots, which it continues for ſome time to reproduce; that it is eaten heartily by every ſort of cattle, and in particular by the cows in graſs, and the cows like it moſt in May, having great influence on the milk; that the hay is eaten more voraciouſly by cows, and has on them great influence in the fleſh; in ſhort, that it is one of the beſt plants either for the milk or the fleſh. Where kept well fed down by ſtock, there can be no doubt of its being a good and nouriſhing plant for both cattle and ſheep ſtock.

And Mr. Young ſtates, that he had long before recommended this plant for laying land to graſs, and ſowed it on his own farm. At the ſame time he thinks it extravagant to propoſe dandelion and ſorrel as plants proper for a cow paſture; and conjectures that thoſe plants being found among good ones, have qualities given them which do not properly belong to them; he is likewiſe inclined to make the ſame conjecture in reſpect to narrow-leaved plantain, ribwort, or rib-graſs, and ſhould even have preferred dandelion and ſorrel to it: but he is cautious of oppoſing theory to practice. But Dr. Anderſon contends that narrow-leaved plantain or rib-graſs is well liked by horſes and cattle, and yields a very good crop upon rich ground tending to dampneſs, if it is at the ſame time ſoft and ſpongy; but that upon any ſoil which has a tendency to bind, or upon dry ground

ground, it furnifhes a very fcanty crop. And it has been made ufe of in fome parts of Yorkfhire as a fummer grafs. As an article of pafturage for cattle and fheep, it is there in high efteem; it is not, however, well eaten by horfes; and as an article of hay it is held to be detrimental to the crop; retaining its fap an unufual length of time; and when fully dry falls into a fmall compafs, or is broken into fragments, and left behind in the field. One advantage of this plant is, that its feeds may be eafily procured genuine. A fmall proportion of it may be eligible: it has now ftood the teft of twenty years eftablifhed practice, and feems to be ftill in good eftimation even among farmers that are the moft attentive in grafs hufbandry. It has been ftated by Mr. Marfhall that he made a trial of it in Norfolk, as a fubftitute for clover, but gained no credit from the experiment: on which it has been obferved that the fact is, horfes do not affect it, and they are the principal confumers of the clover crop in that county. It is a plant that varies much in fize as well as in the breadth of the leaves, &c. The narrow leaves have only three ribs. The fpike is fometimes furrounded by large leaves, inftead of the ufual fmall bracteas: it fometimes becomes an abortive panicle: and it is found with two or three heads. Its qualities feem to be nearly the fame with thofe of the following; and it is more ufed than that by the common people in fome places.

It is probable that the fort which has been termed grafs-leaved plantain (*tenuifolia*) by Dr. Anderfon, is only a variety of this. See Rib Grass.

Plantago, *Major*, the great plantain. This affords more feeds than the former, and is perennial. The root when old is the thicknefs of the thumb, præmorfe or ftumped, laying ftrong hold of the earth by its fibres, which ftrike deeply, and are whitifh. The leaves petioled, feven-ribbed, or fometimes nine-ribbed, fmooth, but fomewhat hairy when young, about a hand in length, often remotely toothed about the edge. The petioles long, convex on the under fide, concave above, each forming a kind of fheath at its bafe. The fcapes upright, pubefcent, longer than the leaves. The fpikes cylindrical, very long, linear, compofed of many clofely imbricate flowers, under each of which is a lanceolate concave bractea. This is likewife a plant, according to Mr. Zappa, that may be ufeful as a cattle food. It grows not only along the roads, near dunghills, in damp and fat places, but in irrigated meadows alfo of every diftrict in Lombardy, though more near the borders than in the centre of them; it vegetates later than the above, flowering towards the end of May; the leaf is fix inches long, and the ftalk almoft a foot high; notwithftanding it is not tender, every fort of cattle like it, and cows are as fond of it as of the above fort. It has alfo been noticed by Mr. Curtis that cattle in general appear very ready to eat the leaves. Sheep, goats, and fwine, alfo eat it well. But it is not in fo much efteem among the farmers as the narrow-leaved fort. See Rib Grass.

Plantago, in the *Materia Medica*. The leaves of the plantago major, common great plantain, or weybread, have a weak herbaceous fmell, and an auftere bitterifh fubfaline tafte, and their qualities are faid to be refrigerant, attenuating, fubftyptic, and diuretic. Plantago was formerly reckoned among the moft efficacious of vulnerary herbs; and by the peafants the leaves are now commonly applied to frefh wounds, and cutaneous fores. Inwardly they have been ufed in phthifical complaints, fpitting of blood, and in various fluxes, both alvine and hæmorrhagic. The feeds, however, feem to be better adapted to relieve pulmonary difeafes than the leaves, as they are extremely mucilaginous. The roots have alfo been recommended for the cure of certain intermittents, and from the experience of Bergius, not undefervedly. An ounce or two of the expreffed juice, or the like quantity of a ftrong infufion of plantain, may be given for a dofe; in agues the dofe fhould be double this quantity, and taken at the commencement of the fit. Plantain has been alleged to be a cure for the bite of the rattle-fnake; but for this there is probably little foundation, although it is one of the principal ingredients in the remedy of the Negro Cæfar, for the difcovery of which he received a confiderable reward from the affembly of South Carolina. PLANTANOCEPHALUS, in *Botany*. See Cephalanthus.

PLANTARIS, in *Anatomy*, a fmall mufcle fituated in the calf of the leg. See Gastrocnemius.

PLANTATION, in the *Iflands and Continent of America*, a fpot of ground which fome planter, or perfon arrived in a new colony, cultivates and tills for his own ufe.

Plantations, or colonies in diftant countries, are either fuch where the lands are claimed by right of occupancy only, by finding them defart and uncultivated, and peopling them from the mother country; or where, when already cultivated, they have been either gained by conqueft, or ceded to us by treaties. See Colony.

But there is a difference between thefe two fpecies of colonies, with refpect to the laws by which they are bound. For it hath been held (Salk. 411. 666.) that if the uninhabited country be difcovered and planted by Englifh fubjects, all the Englifh laws then in being, which are the birthright of every fubject, are immediately there in force. But this muft be underftood with very many and very great reftrictions. Such coloniſts carry with them only fo much of the Englifh law as is applicable to their own fituation, and the condition of an infant colony; fuch, for inftance, as the general rules of inheritance, and of protection from perfonal injuries. But in conquered or ceded countries, that have already laws of their own, the king may indeed alter and change thofe laws; but, till he actually does change them, the ancient laws of the country remain, unlefs fuch as are againft the law of God, as in the cafe of an infidel country. 7 Rep. 17. Calvin's cafe. Show. Parl. cap. 31. See Charter-*Governments*.

Plantations *and Trade*, *Board of*. See Board.

Plantation, in *Gardening*, a certain collection of different kinds of trees or fhrubs, which are cultivated either in nurfery grounds or other places, in order to be raifed and protected to proper and fuitable ftates of growth for being afterwards planted out in particular fituations; or which are planted out for ornamental or other purpofes, generally in the way of beautifying portions of ground or particular fpots furrounding or lying about country refidences, &c. The former are commonly denominated nurfery plantations.

As moft plantations of the latter fort, befides the ornament

ment which they give, afford confiderable improvement to the places where they are formed, they fhould, of courfe, be more fully attended to and regarded, in all cafes and fituations wherever there is any fort of want or deficiency of either variety or beauty. This is ftill further defireable, as they have alfo an excellent effect in all fuch fituations, by giving an idea of grandeur to them, and at the fame time an air of cultivation and fertility.

In the forming of thefe, as well as other kinds of plantations, it is conftantly neceffary to felect and provide the plants with a view to the nature of the foils, and the peculiarity of the expofures in which they are to be placed.

The plants, for the moft part, after being firft raifed from the feeds, or by fome other proper means, and having a little growth, are tranfplanted or removed into nurfery grounds or plantations, where they remain for two, three, or more years, according to their different natures, and the ufes for which they are intended; when they are, in general, ready, and in the beft order for being planted out in different forts of plantations, as larger plants are commonly found not to fucceed fo well. Larger plants may, however, be occafionally found neceffary, efpecially in particular cafes of ornamental planting, and for producing blinds, covers, and fhades, in fome peculiar fituations; but for all common purpofes, in almoft all cafes of this fort of work, young plants, which have been raifed in, and procured from, the nurfery plantations, and which are from about two or three to five or fix feet in their growth, are moftly in the beft and moft proper ftates to be employed, and efpecially in all fituations where timber is in any way an object. The plants fhould alfo be chofen as nearly of equal growth as poffible for the fame plantation.

For all ordinary purpofes of planting, a fmall portion of ground will be quite fufficient for raifing the young plants; but in all nurfery grounds of any extent, there are moftly pretty large tracts fet apart for the purpofe of receiving plantations of thefe kinds, where a great many different forts of trees and fhrubs of various growths are kept, being fet out in rows at different diftances, according to their ages and other circumftances. See NURSERY.

The young plants in all thefe nurfery plantations fhould be kept clean and free from every fort of obftruction, by digging or hoeing frequently between the different rows, until they become of fufficient growth for being fet out in other fituations.

In regard to the preparation of the ground before the making of the plantations, in all thofe of the nurfery kind it is conftantly dug or trenched over with the fpade; and this is likewife fometimes the cafe in forming thofe of the ornamental or other defcriptions; though frequently the plants are put in without, fimply by digging feparate holes at fuitable diftances for the reception of each; or by forming flits or crevices for them by the point of the fpade. The more fully, however, the land can be prepared previoufly to the plants being introduced, the better they will commonly fucceed. Plantations are alfo occafionally raifed by fowing the feeds of the different forts of plants, either in fmall drills, or over the whole furface of the ground, after being made ready in the above manner, or without undergoing any fuch preparation, but in the latter cafe the plants feldom thrive fo well.

In preparing the land for nurfery plantations, a little manure is not unfrequently had recourfe to in digging it over; but for thofe other kinds this is very rarely neceffary.

In making all thefe forts of plantations, the moft proper times for performing the bufinefs is in mild dry periods, either in the autumnal, or very early fpring feafons.

In the forming of every fort of plantation where any kind of ornament is intended, as great a variety as poffible of different forts of hardy trees and fhrubs fhould conftantly be had recourfe to, fuch as thofe of the middling and more tall growths of both the kinds, which in the former or thofe of the tree forts are ufually the oak, elm, afh, beech, chefnut, hornbeam, birch, alder, maple, fycamore, plane, poplar, lime, walnut, wild cherry, mountain-afh, larch, willow, hazel, &c.; and in the latter, or fhrubby fort, the pine, firs, cedar of Lebanon, holly, bay, laurel, yew, ever-green oak, box-tree, and fome others. See DECIDUOUS, EVER-GREEN, and FOREST *Trees*.

In regard to the general difpofition of the plants, the deciduous and ever-green kinds may be planted in feparate compartments, or in mixture, and fometimes the tree kinds by themfelves, fome in running varying plantations, towards the boundaries of lawns, parks, paddocks, &c., others in avenues, groves, thickets, and clumps, varioufly difpofed in different parts; and fometimes the trees and fhrubs together, forming fhrubberies, wilderneffes, fhady walks, and wood-works; placing thofe of taller growth backward, and the lower in front; bordering the whole with the moft beautiful flowering fhrubs and fhowy ever-greens, efpecially next the principal walks and lawns, varying the form of all the feveral compartments, fometimes by moderate fweeps and curves outward and inward, of different dimenfions, other parts in long eafy bends, varied projections and breaks, fo as to diverfify the fcene in imitation of natural plantations. The proper diftances, in planting, may be from five or ten to fifteen or twenty feet: for example, the tall trees defigned for continued plantations may be from ten to fifteen or twenty feet, varying the diftance in different parts, according to light and fhade, &c.; and thofe in groves, where open, may be fifteen or twenty feet diftance, and where clofe ten or twelve; for thickets, five or fix feet, or clofer in particular places where a very dark fhade or thick coverture of wood is required; and in clumps of trees, from five or ten to twenty feet between the trees in each clump, varying the diftance occafionally, according to growth, as alfo the forts and numbers of trees in each, from two or three, to five, ten, or more. The form of the clumps may fometimes be triangular, at other times quadrangular, pentangular, &c., and fome in curves, others in ftraight lines, to caufe the greater variety. And in fhrubbery clumps, and wildernefs compartments, where the trees and fhrubs are employed promifcuoufly, they may be planted from five to ten feet diftance; the taller growths being placed backward eight or ten feet afunder, placing the lower plants gradually forward according to their gradations, to the loweft in front, as above, at four or five feet diftance: and if the trees and fhrubs of the plantations in general are difpofed fomewhat in the quincunx way, they appear to the greater advantage, and produce a better effect in fome inftances.

Before the making of any of thefe forts of plantations, the grounds fhould, in all cafes, be well inclofed in fome manner or other, and the plants be afterwards kept properly cleaned, pruned, and thinned out, fo as to take their full growths.

Mr. Loudon, in his Treatife on Country Refidences, after noticing the great variety which exifts in trees, fhrubs, and all forts of wood, both in refpect to beauty and utility, remarks, that all ornamental plantations may be divided into two kinds; namely, thofe whofe *grandeur* is the effect to be produced, and thofe whofe *variety* or *beauty* is the principal object. And it is afferted, that as grandeur depends more upon the whole than upon the parts, it may be produced where only one kind of tree is employed or made ufe of; but

but that as variety depends upon the parts alone, many different kinds are neceffary. This, it is contended, has given rife to a moft erroneous opinion and very pernicious practice among landfcape gardeners and planters. Imagining that variety is produced by mixture, their rule is to mix as many kinds together as they poffibly can, and never to let two trees of the fame fpecies be feen at once. This is faid to be their recipe for variety in plantations; which they follow, as far as poffible, in every arrangement of vegetables, from the parterre to the foreft. But inftead of affording variety, it is maintained that it, on the contrary, produces the moft diftracting incongruity. The eye, in examining the parts, finds no connection—no harmony—no relief—no repofe of effect—no difference of compofition, or change of character; or, if the furface of fuch a plantation be looked upon from a diftance, it is on account of the indifcriminate mixture of forms, more dull and monotonous than if only one fpecies of tree had been ufed. Its outline againft the fky is a mere unvaried zig-zag line; which, except in artificial plantations, is not to be found in the whole range of nature. It is further fuppofed, that this mixture is evidently produced by their ignorance of that which conftitutes variety; for it does not, as they imagine, confift in the diverfity of feparate parts, but "in the diverfity of their effects when combined together; in a difference of compofition and character:" very different from the other is the effect of fuch a variety; it relieves the eye and interefts the mind, without fatiguing either.

Therefore, in forming a plantation with a view to variety, inftead of felecting fuch trees and fhrubs as are of oppofite character, thofe differing in the flighteft degree are in general much better adapted to the purpofe. The upright fpiry *form* of the larch, mixes very ill with the round head of the oak. But by choofing trees of intermediate forms, and placing them in the interval between thefe extremes, a natural connection and gradation will be produced. By this means, with the ftore of trees and fhrubs which we poffefs, an endlefs fource of variety in woody fcenery may be had from the forms of trees and their modes of growth, independently of any other material of landfcape.

But there is another fource of variety which arifes from grouping, or the manner in which trees are difpofed, more than from the number of diftinct fpecies. And this is chiefly applicable to extenfive plantations where the general character is grandeur, as woods, groves, and forefts. It is produced by mixing together tall and low growths; planting irregularly, fometimes very clofe, at other times very wide; by pruning fo as to expofe trunks, ftems, or branches, in fome places, and to conceal them in others, &c. Much of the effect alfo depends on the diverfity of age in the low growths, as well as the difference of magnitude and accidental form of the trees. This kind of variety, it is fuppofed, exifts in the greateft perfection in natural forefts; and the true way to ftudy its principles is, to obferve in them the effects of time, accident, the browfing of cattle, the felling of timber, and other circumftances. By this means we fhall, it is imagined, be enabled to transfer the fame effects, fometimes by different and fometimes by fimilar methods, to artificial plantations. Natural forefts cannot be too ftrongly recommended to the examination of the ornamental planter. Almoft every other operation of planting is mechanical; it is in this mode of grouping, and following the principles of nature, that the man of tafte will be diftinguifhed from the mere gardener. The effect of putting in practice the principles to be derived from fuch a ftudy may be feen, it is faid, in Mr. Price's woods at Foxley, which no man of tafte ever, it is fuppofed, faw without being filled with wonder and delight.

A ftill further fource of variety, which is independent of the modes of growth or the manner of difpofition, is in the *colour*. Therefore, in order to affift in the arrangement of a numerous collection of trees and fhrubs, a knowledge of the harmony of tints is effentially neceffary to the planter, and of very confiderable importance to his fuccefs in the bufinefs.

It may be thought, that the different tints of green in trees are diftinctions too minute to be attended to for this purpofe; but reflection and experience fhew that they are of material confequence in this fort of fcenery. Imagine, fays the writer, two woods of equal and confiderable extent,—the one compofed of the yellow green of the weeping willow, the other of the dark green of the oak: how different muft be the impreffion received from each, though the general form and compofition of both, at a diftance, would appear in fome meafure the fame! It is evident, that the effect of the different greens muft be much more confpicuous in fcenes intended to be more minutely examined by the eye: how different even the green of the goofebery-bufh and currant-tree when oppofed to each other!

It it remarked, that the tints of trees may be confidered in refpect to their harmony with one another—with external fcenery—their gradation—and their particular effects. The harmony of tints is fuppofed, in general, to be derived from the refpective agreement, difagreement, and deftruction of particular kinds when mixed together; and that thefe harmonies, difcords, and privations, will remain true, although the colours fhould not be bright. The flighteft tinge will have the effect. When weak colours that agree are placed near each other, they fupport and give fpirit to one another. A hawthorn hedge, among the green of pafture fields, has, it is afferted, the fame dull green appearance; but when oppofed to the brown of a ploughed field, it appears with peculiar fpirit and force. And again, the ploughed field, were it not contrafted with the hedge or fome object of a fimilar colour, would appear dark and colourlefs; but oppofed to the hedge, it appears of a rich brown. A Huntingdon willow, obferved alone, it is maintained, appears green like any other tree; but, contrafted with an oak or a chefnut, it approaches to white; and the oak again, by the contraft, appears much darker than before. If plantations were arranged agreeably to thefe principles, the colours would, it is believed, at all times appear ftriking and forcible; but from the oppofite conduct, that of mixing all colours together, they are *annihilated, and their feparate effects deftroyed*. In confequence of this, it is frequently faid that *trees have no colour but green, except in autumn*, and that attention to thefe principles in their arrangement is frivolous. But nothing can fhew greater ignorance of nature. Green is indeed the predominant colour of trees; but it is only in one or two of the fummer months that it nearly abforbs every other colour. All trees have their peculiar autumn and fpring tints, which in midfummer are only weakened, not deftroyed; and, whether it be not of greater importance to attend to the harmony of thefe tints, than to neglect it altogether, becaufe the effect would be in fome degree loft during a month or fix weeks in fummer, every man of tafte or fenfe is left to judge. It is evident, that the *harmony of wood with landfcape* muft depend upon the general principles that have been already mentioned. One principle of harmony is, that the general appearance of the wood planted about a manfion fhould correfpond with the general appearance of the wood in the furrounding country:

 if

if otherwife, the fpace fo planted will appear a formal fpot in the general view. The fame principle requires alfo, that in a fcene where water is a prominent part, and has a tendency to make the landfcape too cold; trees of warm tints (by no means evergreens) fhould be principally planted adjoining to it. On the contrary, where buildings make the landfcape too warm, cool tints, fuch as ever-greens, fhould be planted, to counteract that tendency. Some objects in landfcape require to be relieved and fet off with fpirit, others require to be kept under, or prevented from becoming principal. Thefe, and a great number of other important particulars, are effected by the colouring of trees and fhrubs.

It is remarked, that if we operate with the permanent dark and light greens, as with light and fhade in landfcape painting, we may produce many of the effects of *aerial perfpective*. The imaginary height of a hill may be increafed, by placing dark coloured trees at the bafe, and lighter kinds towards the fummit; fo may the apparent breadth of a lake, by planting trees of a dark green on the fide neareft the eye, and others of a lighter tinge on the oppofite fide; in the fame manner, bays or receffes may be apparently deepened by placing the light coloured greens on the prominences. This mode of operating with the colours of trees will only be deemed unimportant, it is fuppofed, by the ignorant or unexperienced.

But though the harmony of tints only produces a pleafing fcene, their difagreement, on the other hand, may produce a ftriking effect. An outline, which cannot be varied in form, may be broken by the oppofition of its tints, or by maffes of dark and light green. Two or three trees together, that form a ftriking contraft with all around, may attract the eye, and fix it fo, as either to induce it to admire fome object, as a building; or prevent it from viewing fomething difagreeable, or lefs noble, in the fcene. Trees of a reddifh tint, or ever-greens, have the power of attracting the eye in an aftonifhing degree; and in many places, where the former have been planted at random among other trees, they diftract the whole fcenery in the autumnal months.

In regard to the arrangement of the materials of plantations, the great bufinefs is that of uniting beauty with utility in the moft natural manner, which is beft accomplifhed by the confideration of forefts or woody waftes, which are the fpecies of fcenery that approach as near or nearer to nature than any other in this country; by this means may be difcovered the indications of every valuable or ufeful practice in beneficial or picturefque planting. But in refpect to arrangement where utility alone is the main object, it may be obferved, that as every tree has a certain foil and fituation, or thofe in which it will profper better than in any other, that is, produce timber in the greateft quantity and beft quality, and as this tree will in general pay better than more valuable kinds which would not thrive, or would grow too quick in fuch places; it follows, that in the formation of ufeful plantations, one great object fhould be, to accommodate the trees to thefe circumftances, as already feen. And, as the properties of foils and fituations are various, thefe naturally lead to a correfponding variation of the forts of trees alfo; and this *variation*, it is fuppofed, *at once produces ornament and utility*. Thus, in natural forefts fuch an arrangement actually takes place. Hence, in one part, the oak is found as the principal tree; the hazel the principal undergrowth; and other particular plants, graffes, and moffes, chiefly to prevail. While a little farther on, a few beeches mingle with the oaks; ftill more onward the beech becomes the principal tree; the undergrowths changing in the fame way, the thorn, with other plants, graffes, and moffes being found. Ultimately the land becomes moift, when the birch gradually fhews itfelf, and this moifture increafing as the birch retires, it is fucceeded by the alder; each with their appropriate undergrowths, or ever-varying glades of pafture, as fhewn by Gilpin in his "Foreft Scenery," and "Walks in a Foreft," &c. In this manner the arrangement proceeds throughout the whole foreft; and if the foil were minutely examined, it would be found to vary correfpondently with the trees. Where the oak abounds, it will generally be deep and good; dry where the beech fucceeds beft; and moift in different degrees where the birch and alder prevail.

Planters, it is fuppofed, have feldom a fufficient idea of the effects and advantages that might be produced, by having recourfe to this mode of arranging vegetables in artificial fcenery, whether the firft expence of planting, the future beauty, or the ultimate utility of it be regarded. Only thofe who combine a knowledge of botany with painting, it is imagined, can conceive the variety and perpetual intereft that may be thus created in a place even of the fmalleft extent, and with the leaft natural advantages. In the prefent mode, all improved places have a famenefs in their general appearance; as they are compofed of the fame kind of mixture. The fhrubbery, or a part of it, in one place, is precifely the fame with another at a diftance from it, and affords a pattern of all others; but were nature followed in this refpect, the variety would be endlefs. Nothing, it is believed, could then be more interefting, than to walk or ride through a place thus laid out; to view the trees, fhrubs, plants, and even the graffes and ferns; the infinite diverfity of fhapes, colouring, and compofition of the trees and fhrubs; and the ever-varying openings and intricate receffes between them; again, varied with groups and turfs of flowering plants and ferns, fpreading among the grafs, in every direction; and all this independently of every other object, fuch as buildings, rocks, water, animals, diftant profpect, and even variety in the grounds. So that by this mode of planting, a fituation naturally the moft dull and infipid, may be made infinitely varied and interefting. And it is afferted, that this mode of arrangement is not more beautiful in fhrubberies, flower-gardens, and green-houfes, than it is profitable in extenfive plantations.

In the difpofition of the wood in plantations about country refidences, the forms of the furfaces the moft defireable to be planted in the grounds, are chiefly to be determined by the character which they are to affume. Where they are of an even or level furface, there can be nothing to interfere with this rule; but when the furface is varied with fwells, hollows, and abruptneffes, the great art is, to combine the natural character of the place with the character to be created; and when thefe are underftood by the defigner, the beft effect will be produced. However, independently of artificial characters, nature always points out rifing grounds for plantations. Wood placed on knolls or fwells, it is contended, heightens their effects, and gives fpirit, force, and intricacy to a fcene, otherwife tame and monotonous. On the contrary, wood placed in the hollows only, or in the hollows and eminences indifcriminately, deftroys all the expreffion or natural features of the furface, and often produces deformities. Nothing is more noble than a fteep hill clothed with wood; but, imagine this hill perfectly bare, while the furrounding country is wooded, and it becomes a deformity in the general view. To plant the hollows, and leave bare the eminences, is, in almoft every fituation, counteracting nature. Even in pleafure grounds or parks, a group of ſhrubs, or a few trees, placed upon a riſe, however gentle, ſet off the ſcene, as it were, at once; but, plant them only in the low places, and they will remain until full grown before they have much effect; and at that time, though the reſidence may have the appearance of wood at a diſtance; yet, when it is examined particularly, the features of the grounds are totally deſtroyed. There are many places in the country which have a ſufficient quantity of old wood, which, if it had been planted with a proper regard to the natural variety of the grounds, would have made them as ſuperior to their preſent ſtate, as that is now to ſuch as are totally deſtitute of trees. It is not, however, meant that no low ſituation ſhould be planted, or that trees ſhould be placed formally on the ſummit of every eminence; on the contrary, dills, dingles, and ſuch romantic places ſhould be ſhaded with wood; and not a group, nor a ſingle tree ſhould exiſt, but what appears connected with other trees, as well as with the grounds. Taking the country in a general point of view, the hills ſhould be wooded; the riſing grounds between the hills and vallies diverſified with handſome reſidences, paſture lands, and ſome corn fields; and the loweſt parts kept in a ſtate of almoſt perpetual aration. Theſe vallies in general, in order to promote a more free circulation of air, and favour the particular mode of farming to which they are ſuited, ſhould be free from plantations, and ſometimes even from hedges. Viewed from riſing grounds in the autumnal ſeaſon, they ſhould preſent broad flat ſhades of rich yellows, interſperſed with farm houſes, and relieved by roads, canals, or rivers. An example in illuſtration of which is ſuppoſed to be met with in the valley called the Carſe of Gowrie in Scotland.

In fact, it is contended, that there is nothing of ſo great importance as the ſituation of wood, whether the general appearance of the country and the improvement of its climate, or the beauty and value of individual properties, are had in contemplation. All other operations that can be effected about reſidences, are thought comparatively of little conſequence. It is the wood, it is ſuppoſed, like the ſhades in a picture, that gives the effect; and as it is by the ſituation and relative connection of theſe ſhades, that an expreſſive or unmeaning picture is produced by the painter; ſo by the ſcite and connection of plantations, a place is either deformed or beautified by the planter. Even ſmall groups and detached trees are of the utmoſt conſequence in this reſpect, when ſkilfully performed or put in their places, but where the contrary is the caſe the whole is ſpoiled. It is ſaid to be lamentable to ſee the plantations that are daily making at a conſiderable expence, without any regard to this principle. In this level country it may, however, be thought of leſs conſequence, than where the grounds are ſtrikingly varied by nature, as in Wales and Scotland, where it is of the firſt importance. It is conceived, that in leſs than half a century, wood may completely change the appearance of the reſidences of gentlemen, and of the whole country; and thoſe who underſtand the ſubject will allow, that there is ſome danger of the change producing a bad effect, as is illuſtrated by the example of ſome parts of Scotland.

In reſpect to the quantity and diſpoſition of the wood which is to ſurround reſidences, it ſhould either, it is ſaid, be arranged in groups, ſo cloſe together, as, at a ſmall diſtance, to appear a connected maſs; or one or more large irregular maſſes muſt be planted, to which all the groups and ſingle trees ſhould ſeem to belong. The former method, it is ſuggeſted, will have a good effect when the ſurface is unvaried; but can only be adopted with propriety, when the ſituation of the reſidence is elevated or on a declivity, where moiſture or ſtagnation of air will not prove pernicious. But the latter method may be had recourſe to in every caſe. In *levels*, the principal maſs or maſſes may be placed at ſome diſtance from the houſe; which may ſtill be connected with it or them by intervening groups judiciouſly placed for the purpoſe. On *irregular ſurfaces* and *hilly ſituations* the ſame mode may be ſucceſsfully adopted. The maſſes may generally be placed upon the hills, while the connecting chain, thickets, and ſtraggling groups deſcend into the valley, and embrace the houſe. Theſe groups ſhould never be large, three or four trees together will generally be ſufficient; their effect depends not upon the magnitude of the group, but upon their number and apparent connection. This object is attained by making the groups looſe and open, and by ſcattering ſingle trees among them; and again by grouping theſe ſingle trees, and even many of the groups and thickets, with low growths, as hollies, thorns, honeyſuckles, ivy, &c. to take away from the formality of ſolitary and naked ſtems riſing from ſmooth turf. The common method of ſcattering ſingle trees here and there, and always at ſome diſtance from one another, gives a formal *ſtemmy* appearance to a lawn or park, which is never ſeen in nature. An example of the valuable mode of forming plantations, which is here recommended, is given from Foxley.

In regard to the nature or kinds of plantations, they may be conſidered as the *grove*, which is a collection of trees without undergrowth; the *wood* or *foreſt*, which is a collection of trees with undergrowth; the *copſe-wood*, which is undergrowth alone; the *group*, which is compoſed of two trees or more, or a tree and one or more ſhrubs planted together; and the *avenue*, which conſiſts of ſingle rows of trees ſet in different directions according to fancy or utility.

The firſt, or grove, is divided into two kinds, the former of which is commonly employed for ornament in parks and other ſimilar places. Theſe are moſtly uninicloſed; they admit the paſture to grow below them; and appear, in walking through them, as a large collection of ſingle trees. The latter kind of which is compoſed of the pine or fir tribe. This ſort is for the moſt part planted upon hills, moors, commons, or other places of the ſame nature; they are thicker than the former kind, and they effectually prevent the growth of paſture: they are principally incloſed. The character of the former is generally ſolemnity and beauty; that of the latter chiefly pictureſqueneſs. Groves are originally planted equally thick with other plantations. As they grow, they are gradually thinned out, until the trees left ſtanding are able to defend themſelves from cattle. The fence is then removed or deſtroyed, the outline varied, and the ſpaces between the trees ſown with graſs-ſeeds. Fir groves are often allowed to remain, without thinning, until they are fifteen or twenty years old; and then they are conſidered as a full crop, and cut regularly over. See GROVE.

The ſecond, or wood, is moſtly well ſuited both for ornament and utility. It is primarily formed by planting timber trees at ſuch diſtances as would form a grove, and filling up the interſtices with the kinds intended for undergrowth. This, it is ſuppoſed, is the moſt generally applicable kind of plantation, and commonly the moſt profitable, particularly when in ſtripes and belts. There, the undergrowth thrives beſt; thickens the ſtripe below; completes the ſhelter; and by concealing the real breadth, gives a maſſiveneſs and grandeur to narrow plantations, which they can never have, if planted in the grove ſtyle. Oak undergrowth is generally the moſt proper, and, if its worth were fully known, many plantations might be made

made of double their prefent value, have a much better effect, and afford better fhelter. Moft plantations, efpecially in the northern parts of the country, though they generally go under the title of woods, are, in reality, of the grove kind. None of the trees are found kept under the reft in a decided manner, cut over, and allowed to fpring up again, while a certain number, from fifteen to thirty feet diftance, are preferved until their timber be full grown; but the trees being once planted, are allowed to grow up together, only a few being thinned out where they are too much crowded, and even this is very little attended to. Thofe removed are either cut over, or grubbed out by the roots, as is found moft convenient, without any regard to propriety. In confequence of this management, a few bufhes of undergrowth are found in fome places, and the reft of the ground, if not fhaded too much by the crowded trees, is covered with pafture; and neither the pafture, nor the undergrowth, from being intermixed, can be turned to the advantage of the proprietor. There are other plantations where undergrowth exifts among timber trees in a more general way, but of kinds which are of little or no ufe, except for fuel; and this is by no means a profitable article, efpecially in a cold diftrict. But, on the other hand, there are woods in fome places where both timber and undergrowth are cultivated; and it is from obferving the great profits derived by the proprietors of thefe, that the advantages of raifing oak undergrowth in woods is fo ftrongly recommended. The very high price which is given for oak-bark is generally known; and the fum given for an acre of oaks, from twelve to twenty-five years old, valuable for the bark alone, is very confiderable. Inftances of thefe kinds are adduced from the woods of Dunkeld in Scotland, where there are lands of very little value for any other purpofe, that contain oak woods, chiefly of the natural kind, the undergrowth of which is fold every twenty-five years, at the rate of from 35*l.* to 60*l.* the acre, clear of all expences; or from 25*s.* to 48*s.* the acre annually; independent of the value of the timber trees left, fifty of which commonly remain to each acre. And in more low and fheltered fituations, it is contended, that double the advantage would be derived, in confequence of the more quick growth, as in fuch cafes the undergrowth would become equal in fize in the courfe of twelve or thirteen years, and therefore afford two cuttings inftead of one in the fame length of time; befides more uniform crops be produced, from the greater regularity in planting, which would be adopted. But left oak undergrowth fhould be thought to be made more profitable than it really is, it is further remarked, that, in the moft cold, hilly fituations of Scotland and Wales, it will afford upwards of 2*l.*, and in more favourable fituations above 3*l.*, the ftatute acre annually; and if properly attended to in its early growth, ftill more. The eafy and cheap method of raifing it by means of the acorn, is alfo a great recommendation of it, as well as that of its growing better and more expeditioufly in this way. Where an undergrowth alone of oak is wanted, other forts of timber trees may be planted with the acorns. Thefe ftatements ftrongly difplay the fuperiority and advantages of woods over other kinds of plantations; but the recommendation of the formation of them, exclufive of groves or coppices, is not by any means intended, as, on the contrary, there are thin kinds of land, with bad under ftrata, where the fir formed into groves, is more profitable than any other kind of plantations: and there are fteeps and rocky banks, where no tree can be fo advantageoufly cultivated as the common afh; and rich moift places, where no plantation will turn out fo profitable as ofiers. But, generally fpeaking, it may be fafely afferted, that woods are the kind of plantation that ought to be moft commonly formed; and that though the kind of *timber* grown in thefe woods muft vary according to the confumption of different places, yet that oak will be found the beft and moft profitable *undergrowth* of any. See WOOD.

In refpect to the third fort, or copfe-wood, it is alone feldom defirable in point of character, though, in many places, it is the moft profitable kind of plantation. Its formation is very fimple: when of a proper fize it is cut down; after which, the ftools fpring up again; and this operation is had recourfe to in a periodical manner. Thefe kinds of woods are, however, in general, under a very wretched fort of management in many parts of this country. See COPPICE.

With regard to the fourth, or group, whether made in the ground, or in the hedges which divide the fields, it fhould be well and ornamentally formed.

And in the fifth, or avenue, whether the rows of the trees be leading to a refidence or in other parts of grounds, they fhould be well fuited to the nature of their fituations and other circumftances. See AVENUE.

In all cafes where plantations are to be made, it is of great confequence to fix upon the moft proper kinds. In afcertaining this, the kinds of woods and fpecies of trees met with in the furrounding country, the market, the prefent or probable expence of carriage by land or water, and a variety of other circumftances, are to be confidered; and that kind fixed upon which will in the end turn out the moft profitable. And the plantations being once made, the particular kinds fhould be held ftrictly in view in their management afterwards. A collection of oaks defigned for a grove, if not gradually thinned out as they grow up, will never, it is fuppofed, fucceed; but if the fame collection were intended for a wood, thinning them out, in place of cutting over, would leffen the crop of undergrowth. There is no method of management that will make a collection of firs a wood; nor can a collection of hazels, or other low growths erroneoufly planted to rear a grove, ever be made to affume that character. The idea of forming and preferving a diftinct character in plantations, it is thought, is never fufficiently attended to by planters in general,—a certain fpace is to be planted; and it is filled up with trees at random. It is fuppofed to be from this neglect alone, independent of all others, as thofe of previoufly preparing the foil to planting, cultivating, and keeping it in order afterwards, training and thinning, with other operations, that few plantations yield one-third of the profit which they might. It is, however, fuggefted, that, if the particular kind of plantation to be formed, were previoufly determined upon, the bufinefs might proceed with a degree of certainty unknown and unpractifed at the prefent period, as well as other great advantages be derived from it.

In relation to the outlines or boundaries of plantations, they fhould, it is imagined, be determined by the character which they are to affume. The tree being a picturefque object, all wood is confequently fo; and as the addition of wood to ground is always an addition of picturefquenefs, although frequently blended with grandeur or beauty, hence the propriety of irregular or picturefque outlines in all kinds of plantations. Where the character to be produced is that of grandeur, the bounding line, it is afferted, fhould confift of bold angular prominences, fucceeded by deep incifions, forming large bays and promontories; and to give thefe ftill greater effect, and vary their outline againft the fky, they fhould be adapted to the variations of the ground, the bays being in the hollows, and the promontories

montories on the eminences. In this mixture of curves and ſtraight lines, the former ſhould generally be obtuſe and convex, and the latter of conſiderable length. All ſhould appear "irregularly great." Such plantations as are made on hills ought always to aſſume the character of grandeur. Thoſe introduced among cultivated fields, and bounded by ſtraight lines, may alſo have a very grand effect, if due regard be had to vary their outline, by attending to the angular inſertions of hedgerows, or belts of planting; though, in this caſe, it is impoſſible to avoid a degree of formality, which is always connected with cultivation, and which, being eſſential to it, cannot be conſidered as a deformity. But where a plantation is to be made of a ſize which does not aſſume the character of grandeur, the outline ſhould be compoſed of ſuch a mixture of ſtraight and curved lines as will relieve each other, produce variety and intricacy, and correſpond with the ſurface of the ground. Nothing can be more unnatural or inſipid than a ſerpentine line, or one wholly compoſed of curves, as the boundary of a plantation: it is totally void of variety and intricacy, and deſtitute of force and ſpirit, which are ſome of the great objects gained by planting, and which it is the peculiar property of irregular or pictureſque forms to confer. The outline, whoſe ornament is a principal conſideration, ſhould be broken by ſingle trees and groups, ſo diſperſed, as to increaſe its irregularity, and take away from that formality and ſameneſs which lines of every kind have, when viewed alone. Thoſe who attempt this, without underſtanding effect, clog up the bays and receſſes, in place of making them appear deeper and more intricate; and thus they do much more harm than good. The outline is alſo greatly varied, and much improved, by mixing low growths with timber trees along the boundary of the plantation; and afterwards by taking away the fence, and making partial inroads or receſſes of different forms and degrees of depth. In open groves, where the trees ſtand ſingle, and have no fence, the outline is eaſily varied, and with great effect. The different forms, colours, and ſhades of green, when no other mode is applicable, may often have a ſurpriſing effect in apparently varying the boundary of a plantation; a fine example of which is ſeen at Keddleſtone. Groups and thickets, when planted in place of a circular fence, like a clump, ſhould always have the moſt irregular outline. This irregularity is apparently increaſed, by mixing low with tall growths at planting; by removing the fence, when theſe are grown to a certain height; and by judicious thinning. The great beauty of ſmall groups and ſingle trees ariſes from their connection, and the bends and inclinations of their ſtems. This may be produced, by planting two or more trees or ſhrubs in one hole, of different kinds, or the ſame kinds of different ſizes, &c.; and connecting theſe by others ſtraggling round them. And the moſt beautiful examples for this ſort of work are, it is ſuppoſed, to be found in natural foreſts, or woody banks and commons, where trees have ſprung up in an accidental manner. Examples repreſenting the manner in which ſmall maſſes and groups of trees may be grown, without giving a clump-like appearance to the incloſures, are given from the working plans of planting at Barnbarrow, and other places. The general forms of the maſſes may, it is aſſerted, be infinitely varied on a level ſurface; and on an irregular one, they ſhould correſpond with it. And, as it is believed that this principle is univerſally applicable, there never can be the ſmalleſt neceſſity or apology for any thing of the clump kind in ſuch caſes.

Plantation, in *Rural Economy*, a portion of land planted with timber, or other trees. It is plain that plantations, when judiciouſly made, not only afford great improvement to eſtates, but are highly ornamental to the country. They ſhould, therefore, be more particularly attended to, where there are large tracts of poor barren lands, that cannot be converted to the more profitable purpoſes of tillage or graſs. They have alſo a fine effect in the vicinity of habitations. And in many caſes, the proprietors of eſtates, whether of large or moderate ſizes, may reap great pleaſure and advantage in allotting a part of them to this uſe, as they give an air of cultivation and fertility; and after eight or ten years, in many caſes, bring in great profit by the gradual thinning of the underwood, beſides leaving a ſufficiency of ſtandards to attain full growth. The expence attending the making of plantations, and the knowing that they muſt wait ſeveral years before the trees have made any conſiderable progreſs, or can afford any advantage, often, however, prove an obſtacle in attempting the proſecution of the buſineſs. But the expence of planting, where the plants are raiſed on the grounds, will not be ſo great as may be imagined, eſpecially as a ſmall ſpot of nurſery-ground will raiſe plants ſufficient, in three or four years, to plant a great many acres of land; and the expence of raiſing and planting, with the loſs of time in waiting till the plants attain ſome growth, will be compenſated by the firſt fall or thinning, in eight or ten years after planting; and the ſtools which remain ſhoot up again, in many of the deciduous kind, and afford a lopping every eight or ten years, excluſively of the due portion of ſtandards, left at proper diſtances to attain full growth for timber, or other purpoſes.

It may be noticed that, in former ages, this iſland abounded in natural plantations or foreſts, which ſpread themſelves over the ſurface of it to a very conſiderable extent, and which were compoſed of various ſorts of tall or lofty trees of great magnitude, all blended together in a promiſcuous manner, and of ſpontaneous growth. Thoſe vaſt foreſts were never planted by any human hands; ſuch only have been employed for ages in cutting them down: for in many places there were ſuch profuſions of uſeleſs wood, that large tracts were obliged to be cleared by degrees, in order to cultivate the ground for other purpoſes; which, together with the neceſſary demands for the wood, from time to time, for building, and other uſes, as well as that of the owners of ſuch lands reaping conſiderable advantage from the ſale of their timber, continued gradually, one generation after another, the practice of grubbing up and deſtroying their timber woods and plantations without meaſure: and but few ever planted any in the place of that which they cut down; ſo that, in many parts, there is at this time almoſt a general demolition of woodland, and many conſiderable eſtates have ſcarcely any timber of conſequence or value left ſtanding upon them. There is, in ſhort, a want, in moſt places, of nearly a complete renovation of the timber; which ſhould take place as ſoon as poſſible, otherwiſe the nation, in many parts, may ſuſtain conſiderable injury, from the increaſing ſcarcity of ſo important an article of internal produce and general conſumption. Every portion of land in the kingdom, which is capable and proper for the purpoſe, ought, therefore, without delay, to be covered with plantations of this ſort. All the different ſteep, waſte, unproductive tracts of land, in different ſituations, are in general fit for being converted to this uſe, often with conſiderable advantage, as from two or three to eight or ten times that which they could be made to afford under any other ſyſtem of cultivation. It is indeed remarked, that of ſuch barren waſtes, there are few ſpots which would not admit of being improved in this manner, under particular circumſtances;

circumſtances; and that there is a very great number of tracts, of vaſt extent, on which it would be far more profitable to the owner than that of attempting any other ſorts of improvement; as in all thoſe caſes where the ſoil is dry, but of an infertile nature, of a heathy, ſtiff, hard, clayey quality, with little ſurface produce, or where it is much covered or filled with rocks and ſtones; that, in fact, there is hardly any land ſo poor, barren, rocky, or unproductive, as not to admit of it, when properly managed.

In making plantations, it is neceſſary to chooſe ſuch trees as are adapted to the nature of the particular ſoil and ſituation. As to the proper ſorts of trees, moſt of the deciduous and evergreen kinds may be employed with propriety; and young plants of from about two or three to five or ten feet in height always prove more ſucceſsful than ſuch as are older, as thoſe of a younger growth always take root ſooner, and eſtabliſh themſelves more firmly, ſo as to form conſiderably the fineſt plantations at laſt, and are of longeſt duration: for though large trees of from fifteen to twenty feet in height, eſpecially of the deciduous kind, may with care be tranſplanted, ſo as to grow, and probably thrive tolerably well for ſome years; yet, by not rooting firmly, like young plants, they often fail, and, after ſome years ſtanding, have hardly any ſhoots, and at laſt gradually dwindle and periſh altogether.

In caſes where large plantations are to be formed of foreſt and timber trees, particular ſorts muſt be choſen, conſiſting of deciduous and evergreen trees. Of the firſt kinds, the oak, elm, aſh, beech, cheſnut, hornbeam, birch, alder, maple, ſycamore, plane, poplar, lime, walnut, mountain aſh, larch, willow, &c.

There are two methods practiſed in forming plantations: one is by raiſing the trees from ſeed at once, on the ground where the plantation is intended to be, eſpecially the deciduous kinds, and which is effected by ſowing the ſeed in drills, a yard aſunder, the plants remaining where raiſed, thinning them gradually; the other method is by previouſly raiſing the plants in a nurſery, till two or three feet high, then planting them out into the places allotted them. The former, or that of raiſing the plants where they are to remain, though it may be more expeditious, and at once gets quit of the trouble of tranſplanting, requires greater attention for a few years, till the plants have ſhot up out of the way of weeds; but the trees, from their always remaining where raiſed, without being diſturbed by removal, may probably make a greater progreſs. The latter method, or that of raiſing the trees firſt in the nurſery, is probably the moſt commonly practiſed, as being thought the leaſt troubleſome and expenſive, with regard to the attendance at firſt to the young growth. In reſpect to the preparation of the ground for the final reception of the ſeed or plants, it is moſtly performed by deep ploughing and harrowing upon ſuch ground as the plough can be employed on; but where this or other tillage is not practicable, only young plants from the nurſery can be uſed, digging holes, &c. at proper diſtances, one for the reception of each plant. Where, however, the ground can be tilled, it will prove very advantageous, by performing it a year before; ſowing it with a crop of turnips, or other plants of a ſimilar kind; and when theſe come off, ploughing and harrowing the ground again, for the reception of either the ſeed or plants the enſuing ſeaſon. The moſt proper ſeaſon for making this ſort of plantation, either by ſeed or plants, is any time in dry mild weather, in the autumn, as from October till February, or later in moiſt ſoils. Where large tracts are to be planted, both the ſeed and plant methods muſt be purſued all winter, at every favourable opportunity. The ground, where the plantations are made, ſhould be previouſly fenced in all round with a deep ditch, to guard againſt the encroachments of cattle, or other animals. In reſpect to after-management, while the plantations are young, they muſt have ſome attendance to deſtroy weeds, which may be expeditiouſly executed by hoeing between the rows in dry weather, or occaſionally by horſe-hoeing: and this care will be needful for two or three years, eſpecially to the ſeedling plantations, until the trees are advanced out of the reach of weeds; after which no farther trouble will be required, until the trees are ready for the firſt fall or thinning for poles, faggots, &c.

After eight or ten years growth, they are moſtly of a proper ſize to begin the firſt fall by a moderate thinning, which will ſerve for poles and faggot-wood, to repay ſome of the expence of planting, &c. But only a part of the plantation ſhould be lopped the firſt year; thinning out the weakeſt and moſt unpromiſing growth firſt, leaving a ſufficiency of the moſt vigorous plants pretty cloſe, to grow up for larger purpoſes; the year following thinning another part, and ſo continue an annual thinning fall, till the whole plantation has been gone over; cutting each fall down near the ground, leaving the ſtools to ſhoot out again, eſpecially in the deciduous kinds; and by the time the laſt fall has been made, the firſt will have ſhot up, and be ready to be cut again. So the returns of the fallings may be contrived to be every ſix, ſeven, eight, or ten years, or more, according to the uſes the poles or wood are wanted for: and if large poles, &c. are wanted, the fall may be only once in fourteen, eighteen, or twenty years; ſtill at every fall being careful to leave enough of the moſt thriving plants for ſtandards; being left pretty cloſe at firſt, that they may mutually draw each other up in height, but thinned out in every ſucceeding fall as they increaſe in bulk, and ſo as to leave a ſufficient quantity of the principal trees at proper diſtances, to grow up to timber; which in their turn, as they become fit for the purpoſes intended, may alſo be felled, according as there may be a demand for them, to the moſt advantage; having young ones from the ſtools coming up in proper ſucceſſion, as ſubſtitutes, ſo as the ground may always be occupied as completely as poſſible in all parts.

In regard to the advantages that may be derived from the uſe of different ſorts of trees in plantations, they have been ſtated as very conſiderable by different writers. In Mr. Melliſh's experience, on a foreſt ſandy ſoil of 3*s.* an acre value, as ſtated by Mr. Young in his Eaſtern Tour, in 1771, and made in different ways; as by cleaning the land in the manner as for grain, ploughing once and then ſetting the trees, by trench-ploughing and ſetting, and by not ploughing at all, but ſetting in holes, with the ground only cleared for them: the reſults were found nearly equal; but what ſuperiority there was, was in favour of the ploughing method. The ſorts of trees were Scotch and ſpruce firs, larch, oak, aſh, cheſnut, beech, birch, &c.; the whole being mixed. The Scotch and ſpruce firs have grown much the faſteſt, and generally ſucceeded with ſcarcely any failures. The number ſet on the acre moſtly 5000; the expence of incloſing, raiſing the trees, and planting, 3*l.* the acre. In five years they require thinning, when the wood taken out about pays for the labour; the number thinned out being about a thouſand. And in five years more they are thinned again, when another thouſand trees are taken out, which make good hedge wood and hedge ſtakes; the value about five pounds more than pays the expence of the labour. When theſe thinnings have been performed, three thouſand are left, which have been found from experience

to

to be then worth 6*d.* each on an average, as ſtandards, and clear of all expences, if ſold. At this time another thouſand ſhould be taken out. Two thouſand are therefore left, which, at 30 years growth, will be worth, as they ſtand, 1*s.* each; and at 40 years, they will be worth 2*s.* each. This is the produce of ſuch poor foreſt ſands; but this experienced planter has, Mr. Young ſays, many Scotch firs planted 35 years ago in good land, which are worth 40*s.* each, and a great many from 25*s.* to 35*s.* On theſe *data*, Mr. Young calculates the profit of the plantations, at different periods, in this manner:

Account of an acre of firs at the end of the fifth year.

	£	s.	d.
Firſt incloſing, raiſing, planting, fencing, &c.	3	0	0
Intereſt of the above ſum five years - -	0	15	0
Rent 15*s.* - - - - -	0	15	0
	4	10	0

In five years more.

Reparation of the fences - - -	0	5	0
Intereſt of 4*l.* 10*s.* for five years - -	1	2	6
Allow for compound intereſt - -	0	15	0
Rent - - - - -	0	15	0
	2	17	6
Firſt five - - - - - -	4	10	0
Expence at the end of ten years - -	7	7	6
Received for thinnings - - -	5	0	0
Exceſs - - - - - - -	2	7	6

At the end of twenty years.

Rent - - - - - - -				1	10	0
Reparation of fences - - - - -				0	10	0
Intereſt - - - - - - -				1	0	0
				3	0	0
Received for 1000 at 6*d.* - - - -				25	0	0
Value of 2000 remaining, at ſame rate -				50	0	0
				75	0	0
Deduct as above - -	£3	0	0			
Exceſs at end of five years -	2	7	6			
				5	7	6
Clear profit in 20 years - - -				69	12	6
Which is *per* acre *per annum* - - -				3	9	1

And that ſuppoſing the 2000 trees left ten years longer, the account will ſtand thus:

	£	s.	d.
Received for 1000 at 6*d.* - - - -	25	0	0
Deduct, as above - - - - -	5	7	6
Profit in 20 years, excluſive of trees remaining	19	12	6
Which *per* acre *per annum*, may be called -	1	0	0

At the end of thirty years.

	£	s.	d.
Rent - - - - - -	1	10	0
Fences - - - - - -	0	10	0
Intereſt - - - - - -	1	0	0
	3	0	0
Suppoſing the plantation then cut down, the 2000 trees at 1*s.* bring - -	100	0	0
Deduct, as above - - - -	3	0	0
Profit - - - - - -	97	0	0
Firſt ten years expence - - - -	7	7	6
Second ten ditto - - - - -	3	0	0
Third ditto - - - - - -	3	0	0
Total expence - - - - - -	13	7	6

Third ditto - - - - -	25	0	0
The 2000 remaining - - - -	100	0	0
Total - - - - - - -	130	0	0
Expences - - - - - -	13	7	6
Clear profit in 30 years - - - -	116	12	6
Or *per* acre *per annum* - - - -	3	17	1

At the end of forty years.

Expences, as before - - - - -				3	0	0
Received for 2000 trees at 2*s.* - -				200	0	0
Ditto firſt and ſecond thinnings - -				30	0	0
Total - - - - - - -				230	0	0
Deduct expences, as before	£13	7	6			
Ditto - - - - -	3	0	0			
				16	7	6
Clear profit in 40 years - - -				213	12	6
Or *per* acre *per annum* - - - -				5	6	1

It is further ſtated, that this account of the expences, produce, and profit, of planting foreſt land at 3*s.* an acre, ſhews the amazing profit of ſuch undertakings. Plantations have, in general, been raiſed with a view merely to beauty, or elſe through a very noble patriotic motive of being ſerviceable to the country; but it is evident, that they may be undertaken with very different views—with thoſe of profit: ſo that a man may cut down the trees he planted himſelf, and expect to reap, in ſo doing, very conſiderable profit. If he cuts all down at the end of 20 years, and leaves not a ſingle tree, he gains a profit clear of near 70*l.* an acre, which is 3*l.* 3*s.* *per* acre *per annum*, from the firſt planting. Let me aſk the moſt ſkilful farmers of this country, how they will exceed ſuch a profit, by any ſyſtem of common huſbandry, on ſuch poor land? It before appeared, that common good huſbandry, after ſome improvements, would yield but 1*l.* 1*s.* 11*d.* *per acre* profit; ſo that the planting to cut in 20 years, is more than thrice as beneficial, and certainly much leſs expoſed to accidental loſſes. But ſuppoſing the trees left 30 years, in that caſe the thinnings pay,

for

for the first 20 years, 1*l.* *per* acre *per annum*; and at the end of the 30th, the account from the first planting is 3*l.* 17*s.* 1*d.* *per* acre; and in 40 years, 5*l.* 6*s.* 1*d.* After which time, they may be supposed to decline in quickness of growth, and consequently had better be cut down, in point of profit. It is noticed, that if beauty of situation is not, in some respects, commanded, we seldom see plantations of quick-growing trees; but it is evident, that poor soils should be planted upon in the mere view of profit. A crop of firs, instead of a crop of wheat, barley, or oats, at 20 years growth, which so many men may expect to see arriving at perfection, turns out far superior. One of the most profitable farms would be a 30 years lease of such land, with liberty to plant and cut down. One of 20 years, which is a shorter period than the generality of long leases, would, thus applied, exceed common husbandry on such soils.

It is added, that Mr. Mellish has a waste, inclosed with a ring fence of 700 acres, which he would let at 3*s.* an acre, tythe free. Suppose a person hired it under a lease of 30 years;

The raising, planting, &c. &c. would come to	£2100
Rent for 700 acres, for 30 years	3150
Reparation of fences, suppose	30
Interest of 2100*l.* for 30 years, at 4 *per cent.*	2520
Total expence	7800
Produce.—Thinning in 10 years, at 5*l.* an acre	3500
Ditto, in 20 years, 1000 *per* acre, at 6*d.*, 25*l.*	17500
Cut down at 30 years, 2000 *per* acre, at 1*s.*, or 100*l.* *per* acre	70000
Total produce	91000
Total expences	7800
Clear profit	83200

This account is stated in the style of a common farm; the first expenditure called stock, and compound interest, not calculated. It is very evident that no man, possessed of such soils, who can hire them for 20 or 30 years, under a planting lease, need ever to be distressed at the idea of younger children's fortunes, or raising large sums of money in future. A moderate expenditure will, by planting, secure the certain possession of any sum that may in future be wanted.

And in Mr. Bevor's experiments, as stated by the same writer, Scotch firs, in 18 years, are found to be worth 2*s.* 6*d.* And a whole plantation of 50 years growth, worth 50*s.* on an average: they stand 20 feet square, which is 108 to an acre. In another plantation on a moist sandy loam, larches of 18 years growth, are worth 3*s.* 6*d.*: spruce firs among them not half so good, which Mr. Bevor attributes to their being trimmed up; others on same soil and growth, not served so, are almost double the size.

Mr. Berney, at Bracon Ash, has also made great improvements by planting land of 20*s.* an acre. Oaks, of 50 years growth, are worth 15*s.* each: they stand 15 feet square; this is 180 on an acre. Larch, in 18 years (20 from the seed), are worth 6*s.* each: they grow out of underwoods that pay 20*s.* an acre. Some few of 20 years, worth 15*s.* each. Silver firs in the same wood not quite so large, but they beat both the spruce and Scotch. They all stand 15 feet square in the underwood. And in another plantation without underwood, Scotch firs, of 18 years, are worth 2*s.* 6*d.* each: they stand 8 feet square; which is 680 on an acre, or 85*l.*; that is, 4*l.* 14*s.* *per* acre *per annum*, exclusive of thinnings. No husbandry, Mr. Young contends, will equal this. A man who would plant for profit must not regret land of 20*s.* an acre.

The Weymouth pines, in 18 years, much larger than Scotch firs of 22 years.

But in Mr. Fellowes' of Shottesham experiments, who has, according to Mr. Young, tried various trees, some years ago, so that he is now able clearly to judge which is the most profitable; the following are the results.

Experiment 1.—A plantation of Scotch firs of 45 years growth, 20 feet square, on land of 15*s.* an acre, are now worth 20*s.* each on an average. At that distance there are 108 trees on an acre, or 108*l.*; which is 2*l.* 9*s.* *per* acre *per annum*, from the first planting, exclusive of thinnings, which would more than double it. But the grass under the trees would have let for many years past at 7*s.* an acre.

Experiment 2.—Another plantation of Scotch firs, 38 years growth, standing in rows 14 feet wide and 10 in the rows, are now worth 12*s.* on an average. This distance gives 300 on an acre; and at 12*s.* they come to 180*l.*, or 4*l.* 14*s.* *per* acre *per annum*, besides thinnings. The rent of the land 15*s.*; poor rates, 1*s.* 3*d.* *per annum* in the pound; and tythe, till 20 years old, 5*s.* an acre; the grass under them now 5*s.* an acre. It is sufficiently evident, Mr. Young thinks, that no husbandry can equal this.

Experiment 3.—Chesnuts in 38 years, on the same land, standing 14 feet by 10, are worth 15*s.* each. This is 225*l.* *per* acre; or 5*l.* 16*s.* *per* acre *per annum*, besides thinnings.

Experiment 4.—Scotch firs in 38 years, on the same land, measure 17 feet of timber on an average, for which Mr. Fellowes has been offered 11*d.* a foot: that is, 15*s.* 7*d.* a tree. They stand 14 feet by 10. An acre would therefore be 233*l.* 15*s.*; or 6*l.* 3*s.* *per* acre *per annum*, besides thinnings. These trees are 60 feet high.

Experiment 5.—On the same land larch trees, of only 31 years growth, are as large as the firs of experiment No. 4, which shews that the larch is a much quicker grower. Spruce by them not so large as either. The pinaster of 38 years, larger than the Scotch. The cedar of Lebanon, of the same age, would now cut into planks 12 inches wide.

Experiment 6.—A very striking comparison between the larch and the spruce fir, was tried by planting an old gravel pit levelled, surrounded by a plantation of Scotch fir, with those two sorts in alternate rows. The larch is from 6 to 12 feet high; whereas the spruce is but 2 feet on an average.

Experiment 7.—A large plantation of many acres of a poor gravelly land at 8*s.* an acre, containing Scotch and spruce firs and larches, is now 16 years old; they are in squares of ten feet, and are worth;

The Scotch, 2*s.* 6*d.* each.

The spruce, 3*s.* 6*d.*

The larches, 4*s.* 6*d.*

At ten feet, there are 435 trees on an acre.

The Scotch, at 2*s.* 6*d.* come to 54*l.* 7*s.* 6*d.*; or *per* acre *per annum*, 3*l.* 7*s.*

The spruce, at 3*s.* 6*d.* to 76*l.* 2*s.* 6*d.*; or *per* acre *per annum*, 4*l.* 15*s.*

The larch, at 4*s.* 6*d.* to 97*l.* 17*s.* 6*d.*; or *per* acre *per annum*, 6*l.* 2*s.*

All three exclusive of thinnings. Suppose, says Mr. Young, we calculate these at no more than paying the rent, tythe, and town charges; and that the larch, in 20 years, come only to 100*l.*, which is, however, under the truth: let any

any one calculate the profit of hiring land on a 21 (or more) years leaſe, and immediately planting. In what other application of the lands can ſuch great profit be made, as gaining 6*l.* an acre without any riſk, and almoſt without any expence? It is true ſuch a conduct cannot, like the culture of corn and graſs, be general, for reaſons obvious to every one; but as far as the whole demand of any neighbourhood extends, it is profitable to execute it.

And ſuppoſe, ſays he, 5 acres of larch planted every year; at the end of 16 or 17 years, 5 acres will every year be cut down, of the value of 500*l.*: from that day a regular product of 500*l.* a-year is gained from the application of 100 acres of land. Let to a tenant, theſe 100 acres produce 40*l.* a-year; but planted, they produce 500*l.* a-year. What an amazing difference! Or ſuppoſe a ſingle acre planted every year, after the expiration of 18 or 20, to cut annually 100*l.* a-year from only 20 acres, which let, would yield but 8*l.* a-year. How beneficial a conduct!

Mr. Fellowes has alſo planted plane-trees, and finds them to thrive amazingly in low moiſt ſituations. They will, in ſuch, grow much faſter than the poplar. One he has of 30 years growth that will cut into planks 20 inches broad; but ſo vaſt a ſize he attributes in ſome meaſure to its ſtanding on the edge of a ditch through which the drainings of a farmer's pigſties run. Poplars, in ſome parts of the kingdom, are planted in low ſituations, to the excluſion of every thing elſe: it is of conſequence, therefore, to know that the plane will do better. But Mr. Fellowes, in general, recommends the larch as preferable to every other tree he has tried; and which will pay a planter much greater profit than any of the reſt. Theſe ſtatements ſhew the great profits formerly derived from planting, and they have not been leſs ſince.

Mr. Davis, ſteward to the marquis of Bath, after obſerving that oaks and beeches planted on the *beſt* ſpots of ground, and nurſed by Scotch firs, will not be ſo valuable at ſixty years old, as the Scotch firs are on the very *worſt* land at thirty, further ſtates, that four firs will grow where one oak or beech will grow; for firs are the better, and deciduous trees the worſe, for being crowded. And that a great deal of poor heathy ſhallow land, which will produce Scotch firs in the greateſt perfection (and a great deal of the land planted by lord Bath is of that deſcription), will not grow oak or beech at all, nor in fact any thing but Scotch fir. Even larch has failed univerſally on all thoſe ſpots where the upper ſtratum is peat. Having lately had occaſion to cut ſome rides through ſome extenſive plantations of Scotch firs which were planted juſt thirty years ago, I meaſured the land, and the trees which were cut off it, very exactly, and the following reſult ſhews that the profit of planting Scotch firs has been full ſeven *per cent.* compound intereſt; whereas no plantation of deciduous trees, within my knowledge, has paid five *per cent*, ſimple intereſt. Indeed we uſually reckon, in valuing eſtates for ſale, that the common growth, even of elm timber, on its moſt favourite ſoils, is ſeldom equal to more than three or three and a half *per cent.* ſimple intereſt.

336 Scotch firs, of 30 years old, cut upon a ſtatute acre, average meaſure three feet *per* tree, valued at only 10*d.* *per* foot, *viz.* 2*s.* 6*d.* *per* tree, amount to, *per* acre, - - - - - -		£. *s.* *d.* 42 0 0
At the time of planting, this land, then newly incloſed from a common, was not worth above 2*s.* *per* acre *per ann.*, which, at twenty-five years purchaſe for the fee ſimple, amounts to -	2 10 0	
And the coſt of the trees and planting was not above - - -	3 0 0	
Total expence *per* acre, even ſuppoſing the land to be annihilated -	5 10 0	

5*l.* 10*s.* principal will increaſe, in thirty years, as follows:

	£. *s.* *d.*
At 5 *per cent.* ſimple intereſt, to only - -	13 15 0
At 5 *per cent.* compound intereſt, to - -	23 15 5
At 7 *per cent.* compound intereſt, to - -	41 17 4

So that the Scotch firs, which have increaſed 5*l.* 10*s.* principal to 42*l.* in thirty years, have paid upwards of 7 *per cent.* compound intereſt. Tranſactions of the Society of Arts. &c. vol. xvi.

The ſtatements which are given below, as drawn up by Mr. Maſon, ſhew the great advantage of making plantations with aſh, on the grounds of his grace the duke of Newcaſtle, together with a valuation of the lands previous to their being planted with the trees.

Theſe 180 acres, now planted, are worth, upon a moderate calculation, 40s. an acre -	180	0	0	40	0	360	0	0

In this caſe, the expences of planting the hundred and eighty acres are ſaid to have amounted to the ſum of 2700l. for which his grace will have the additional rent of 300l. a-year.

The biſhop of Landaff has made the following calculation of the probable profit of converting the waſte rocky lands in Weſtmoreland into plantations with larch. A thouſand acres of this ſort of land might, he ſuppoſes, be incloſed with a circular wall ſix feet in height, (where the ſtones can be eaſily gotten, as they may in moſt parts,) after the rate of ſix ſhillings an acre, or 300l. for the whole; five hundred larches two feet in height, (ſo as to enable them to reſiſt the long graſs,) might be planted on each acre for fourteen ſhillings; hence a plantation of 500,000 larches might be made for 1000l. Now 1000l. improved at compound intereſt, at the rate of 4l. *per cent.*, would, in 60 years, amount to the ſum of 10,519l.: this is the accumulated loſs attending the incloſing and planting 1000 acres of rocky land in ſixty years. The rent of 1000 acres, at one penny *per* acre, is 4l. 3s. 4d. a-year; in eight years the larches would be out of all danger from ſheep, ſo that the loſs of rent ought only to be eſtimated for eight years; but 4l. 3s. 4d. a-year, though improved after the ſame rate of compound intereſt, would not amount to 40l. in eight years; ſay, however, that it would amount to 81l., which is allowing more than two-pence an acre for the annual rent of the land, then would the whole expence attending the plantation in 60 years be 10,600l. If the amount of 81l. for 52 years be taken into conſideration, the expence of the plantation in 60 years will be 11,222l. He has here ſuppoſed ſheep to be ſhut out of the plantation for eight years; if it ſhould be found that ſheep will not crop the larch, (and from more than one obſervation he has reaſon to believe that they will not,) they need not be ſhut out at all; nor, on diſtricts where nothing but ſheep are depaſtured, need any fence be made. He knows the advocates for cloſe planting, inſtead of 500, would require 5000 larches for each acre; he is not convinced of the utility of ſuch cloſe planting, except when it is intended to nurſe up oaks, or other kinds of wood; but if that mode ſhould be adopted, the thinnings, after twenty years growth, would pay the expence of it. At the expiration of 60 years, ſuppoſe that only 250 larches remained on each acre, or that one-half had periſhed, the probable value of them may be thus eſtimated. From a great many experiments made by himſelf and collected from others, he finds the annual increaſe in circumference of the larch at ſix feet from the ground, to be an inch and a half on an average of ſeveral years; and this inference has been drawn from the actual admeaſurement of larches in different parts of England and Scotland, and of different ages, from ten years old to fifty. On this ſuppoſition, the larches would meaſure, one with another, ninety inches in circumference, at ſix feet from the ground. A larch which meaſures ninety inches at ſix feet from the ground, would meaſure above ſeventy at twenty feet from the ground; but ſuppoſing ſeventy inches to be the circumference at twenty feet, and the length of the tree to be forty feet, neglecting the remaining top; then will its ſolid content be eighty-five cubic feet, and the value of the

tree

tree at nine-pence a foot, above three guineas. But as the trees are ſuppoſed to be planted in an high, bleak, barren ſituation, their annual increaſe may not be ſo great as is here ſuppoſed; inſtead of being worth, at ſixty years after planting, three guineas a-piece, admit that they are worth only ten ſhillings each, then would the whole plantation be worth 125,000*l.*, and deducting the whole expence, 10,600*l.* as before eſtimated, there would remain a profit of 114,400*l.* The preſent value of 114,400*l.*, to be received ſixty years hence, is above 10,000*l.* (intereſt of money at 4*l. per cent.*) Ten thouſand pounds at 4*l. per cent.* purchaſes an income of 400*l.* a-year: by planting then, a barren eſtate of a thouſand acres, is improved from 4*l.* 3*s.* 4*d.* to 400*l.* a-year, reckoning the value of a reverſion as a preſent certainty. Sixty years is a great part of the life of a man: but it ought to be conſidered as nothing in the exiſtence of a nation, or even of a family, which is a little nation. The waſte lands in this and other countries are a public treaſure in the hands of private perſons; all of them ought to be converted into arable, meadow, or paſture land, which are capable of admitting, with profit, that kind of improvement; and ſuch of them as will not pay for that mode of improvement, ought to be covered with wood; the high parts, and eſpecially the ſheltered dells in the high parts, with larch, and the lower with oak, aſh, &c.

And in making plantations of this ſort, it has been adviſed by E. Harries, eſq. of Hanwood, to attend to two circumſtances, namely, ſituation and diſtance. The ſtrong weſterly winds are very apt to bend the upper part of the trees, eſpecially if they ſtand ſingle, or upon ſloping grounds. To guard againſt this, a ſhelter of Scotch pines ſhould be planted to the weſtward, ſome years before the larch. In reſpect to giving the plants ſufficient room: in eight years they may be twenty feet high, and their lateral ſhoots extend two yards every way from the trunk; and they ſhould not then be ſuffered to continue nearer than five or ſix yards; and what are left may continue to be uſeful building timber. At firſt planting, a diſtance of about ſeven feet ſhould be allowed; they will then be furniſhed with ſufficient lower branches, which give the tree a ſteady and tapering trunk. The knife ſhould never be applied to them. There is no tree of quicker growth. He has larches that are twenty feet high in ſeven years growth, and ſixteen or eighteen inches round. At thirty years growth, they meaſure from four to five feet round, at five feet from the earth.

As the larch and fir are ſo much in uſe in forming plantations, it may be proper to take ſome further notice of their properties. In ſpeaking of the larch, the wood, Dr. Anderſon obſerves, is poſſeſſed of ſo many valuable qualities, that to enumerate the whole would appear extravagant hyperbole. It is known to reſiſt water, without rotting, almoſt for ever. The piles of this timber, on which the houſes of Venice were built many hundred years ago, are ſtill found as freſh as when firſt put in. Stakes of it have been tried in the decoys of Lincolnſhire, which, between wind and water, have already worn out two or three ſets of oak ſtakes, and do not yet diſcover any ſymptoms of decay. It is alſo known to poſſeſs the valuable quality of neither ſhrinking nor warping when put into work, nor is it liable to be pierced by worms in our climate. Beſides, it is known to be one of the quickeſt growing trees, remarkably hardy, and extremely beautiful. It is much more eaſily reared than the oak, and could be ſpread over a great extent of mountains, if ſufficiently bare of herbage, at little or no expence, by the natural ſhedding of its ſeeds. It would be valuable not only for ſhip-plank; but even crooked timbers might be obtained by uſing a little art to bend it when young. For flood-gates in navigable canals and wet docks, it would exceed every thing that can be obtained in this climate; for barrel-ſtaves it would be inimitable; and in building it would anſwer all the purpoſes to which fir is now applied, being much ſtronger and more durable than that wood. When it is alſo adverted to, that it is next to incombuſtible, it deſerves to be ſtrongly recommended to planters in this country, particularly in the moſt rugged and barren diſtricts; where, at a very trifling charge, eſtates might be brought to a hundred times their preſent value. And that it is ſo much more valuable than the Scotch fir that is now univerſally preferred to it, for plantations of large extent, in almoſt every ſituation. That as it has only been of late introduced into Britain, the qualities of the wood are not ſufficiently underſtood; for before the laſt thirty years it was cultivated rather as an ornamental tree than with a view to profit. But wherever it has been introduced, it grows ſo freely; is ſo beautiful when in leaf; ſo highly ornamental when covered with its abundant pink bloſſoms in the ſpring; and it is ſo elegant in its form, that it is ſure to become a favourite with the planter. However, in the opinion of Mr. Harte, it grows ſlowly the firſt four years; but in twenty years will exceed a fir tree, both in height and circumference, that is double its age.

In making a plantation of larch, the thinnings may be applied to a variety of uſeful purpoſes, whilſt they are yet of a ſmall ſize. In ſix, eight, or ten years, according to ſoil and circumſtances, the trees will have attained a ſize ſufficient to be made into hay-rakes. They grow ſo ſtraight, and the wood is ſo light, ſtrong, and durable, as to be peculiarly calculated for this purpoſe; and from its ſhrinking leſs than any other wood, theſe rakes will remain longer firm than thoſe made from any other. About two feet cut off from the root end will form the rake head; and five feet above that, with a very little taken off from the thickneſs of the under part, will form the handle. No wood is more proper for the teeth of the rake, than ſome of the red wood of an alder tree, becauſe it is not only tough, but little liable either to ſplit or ſhrink. The bow may be made of aſh, or of the laurel-leaved ſweet-ſcented willow (*ſalix pentandra*), which is ſtill better. Nothing is ſo fit for ſhafts to hoes; for it is nearly as ſtrong, and much more durable than aſh. Handles for bruſhes, brooms, ſcythes, &c. would occaſion a vaſt conſumption of theſe ſmall ſpars. And light, neat, and ſtrong chairs, for ruſh bottoms, might be made of larch wood at this age. It is likewiſe ſuppoſed, that nothing will anſwer better for hop-poles; for one ſet of theſe would outlaſt two or three ſets of aſh. Hurdles, ſpars, and gates, may be made of it both lighter and more durable than of any other wood; and when the trees are of a ſufficient ſize, they may be ſplit down for cart-ſhafts; and in mining countries they might be employed as poſts for ſupporting the roofs of the mines. And the ſmall tops cut off in making theſe various works, would furniſh a neat, elegant, cheap, and durable kind of railing, to be put upon the top of low walls, eſpecially for preventing light ſheep from overleaping them. One end might be let into the coping, whether of ſod, clay, or lime; and the other end received into a ſlip of ſawn larch wood, with holes bored through it to receive their points. From the ſtraightneſs of the wood, this kind of rail would be very neat without much expence. In the ſame manner hen-coops, crates for packing glaſſes, &c. might be made of thoſe materials. But one of the moſt extenſive and beneficial uſes of this kind of ſmall wood, is for the purpoſe of incloſing. Theſe ſpars, when the root is thick enough, may be ſlit up the middle by a ſaw, and cut into lengths of five or ſix feet; or if ſmaller, they may be employed whole. As

they

they are always ſtraight, and nearly of an uniform thickneſs, if driven into the ground for a few inches in a row, at the diſtance of a few inches from each other, with the ſplit ſides all one way, they would make one of the neateſt and moſt complete fences that can be ſeen. The tops of theſe uprights may be received into a piece of ſawed plank, with holes bored in it for that purpoſe; and ſupported at due diſtances by ſloping pieces reaching from the ground to the top.

It may, however, be noticed, that it muſt ſtand to be of a ſufficient age before the timber acquires its beſt qualities of ſtrength and durability. The largeſt of the larch trees on the duke of Athol's lawn at Dunkeld, was meaſured in the month of March, 1796, and the following are the dimenſions of it.

	Ft. In.		Ft. In.
At the height of	1 8	from the ground, the circumference is	11 11
	3 0	- - - -	10 $0\frac{1}{2}$
	6 0	- - - -	9 0
	9 0	- - - -	8 6
	12 0	- - - -	8 2
	18 0	- - - -	7 11
	24 0	- - - -	7 7

The whole height was eighty-five feet. There are ſeveral larches upwards of one hundred feet in height, which are five or ſix years younger, but none of ſo great a girth. The largeſt of Mr. Drummond's was ninety-ſeven feet high, but leſs in circumference.

For a trial, the duke of Athol has applied larch to a variety of purpoſes, ſuch as mill-axles, flooring in houſes, window frames and doors, poſts and rails, and boat-building: for all of which it appeared to anſwer ſo well, that it is the greateſt acquiſition of wood ever introduced into Great Britain, eſpecially as it attains a conſiderable ſize on high grounds and bleak expoſures, where even Scotch firs either die or become ſtinted. Fiſhing boats, made of larch under forty years growth, laſt nearly three times as long as thoſe built of Norway fir. The late violent winds blew down a larch in the duke's lawn of fifty years of age, eighty-ſix feet ſix inches in height, containing eighty-two feet of ſolid wood; for which four pounds ſterling was offered as it lay on the ground. And as it is not aſcertained whether larch wood is capable of reſiſting the ſea-worm; Dr. Anderſon has propoſed to prove it by ſinking a piece of the ſound, well ripened wood, with another piece of ſound oak wood in the river Medway at Rocheſter bridge, where it is well known that every other kind of wood is very ſoon perforated by the ſea-worm.

It is therefore concluded, that on account of the valuable qualities of the wood the larch deſerves to be cultivated in this country. And another recommendation of it is, its quickneſs of growth. Eight trees being meaſured in the ſpring and autumn of the year 1794, the average of their increaſe in height was nearly three feet nine inches and a quarter; and one of them increaſed three inches in circumference at two feet above the ground. In another plantation, the trees at eight years growth meaſured above twenty feet in height on an average; the trees were from ſix to nine inches high when planted. At twelve years old they meaſured, on an average, from thirty-four to thirty-ſix feet in height. This plantation was on a good ſoil and in a favourable ſituation. Nor is it only while the tree is young that it makes theſe vigorous ſhoots; for it appears by the meaſurement of the trees in Dunkeld, that this in a great meaſure continues even till a period of age, beyond that which they have as yet attained; for one hundred and twenty feet in fifty years, gives an average of nearly two feet and a half in height for each year of their growth.

Very great improvements have been made in the northern parts of Scotland, by means of plantations of Scotch pine, upon the bareſt moors, and in the bleakeſt and moſt inhoſpitable ſituations; the returns of ſuch plantations having been ſuch as fully to ſatiſfy the owners. And when the collateral advantages are adverted to, the improvements, Dr. Anderſon thinks, are very great indeed; for in the neighbourhood of ſuch plantations, houſes can be reared at ſo little expence, and the roofs are ſo much better than ordinary, as to induce ſettlers to make their dwellings much neater and more commodious than in other places; rails and other dead fences can be ſo eaſily obtained, that poor people are firſt enabled to have good well fenced gardens, and then commodious incloſures of larger extent; the branches afford fuel to the ſettlers; cutting and manufacturing the wood furniſhes employment to many; population is thereby augmented; hence a deſire for land to produce the neceſſaries of life, and a conſequent increaſe of rent to the proprietor. In this way Mr. George Dempſter ſees fields rapidly converting into cultivated grounds on his eſtate, and yielding to him ten or twelve ſhillings an acre rent, not only without any expence to him, but after having derived a conſiderable profit from the ſale of woods of his own planting, which grew upon land that five and twenty years before was not worth, to him, above two-pence an acre, and which might have remained in that ſtate for ages to come had it not been planted. A plantation of Scotch pine can be made at much leſs expence than any other tree in the northern parts of Scotland, becauſe the young plants can be afforded at a ſmaller price. In Aberdeenſhire, plants of two years old (and above that age no experienced planter will ever buy them) ſometimes ſell at four-pence a thouſand, conſiſting of 1200; and they ſeldom exceed eight-pence; and there are men that will undertake to complete the whole incloſing, and planting at the diſtance of a yard from each other, and ſupply the deficiencies for five years, at the rate of from ten to thirty ſhillings the Scotch acre, according to the ſize of the incloſure, and the nature of the fence.

It is found by experience, that there is ſcarcely a ſoil ſo bad or any expoſures ſo bleak, where this tree will not live, if the plantation be of ſufficient extent, and not upon the very ſummit of high peaked hills. They do not indeed bear the ſea air very well; nor is the wood ever of a good quality, or the tree long lived, upon clayey ſoils. Several perſons in the ſouth of England have found, that the pinaſter bears the ſea blaſt much better than any other pines. The ſpruce fir will bear a ſtill more expoſed ſituation than the Scotch pine, and after a few years it ſhoots up with ſtill greater luxuriance. But the cones not being to be had in an equal abundance, and the plants being more difficult to rear, they are ſold at a much higher price. Silver fir in a good ſoil proſpers well, and is a beautiful tree, but the price of the plants is too great to admit of large plantations of them being made.

Where the ſituation is bleak and much expoſed to ſtrong blaſts of wind, the plantation muſt not only be of conſiderable extent, but the trees be planted very cloſe, ſo as to be not more than from two to three feet aſunder; the more expoſed the ſituation the cloſer they muſt be; for it is obſerved, that until the branches intermingle, and thus ſerve to give a mutual ſupport to each other, the trees never begin to advance with vigour. Where the plantations are thus thick, there is a neceſſity for beginning to thin them out from the tenth to the fifteenth year after planting. Where the plantations are extenſive, theſe thinnings ſell at a ſmall a ſmall price, but there are few ſituations in which they will not do more than pay for the expence of cutting them out. Pruning is likewiſe occaſionally neceſſary in many ſorts of plantations. See Pruning, Thinning, and Sheltering *Woods* and *Plantations*.

The leaves and branches of the Scotch pine afford a very wholeſome nouriſhment to cattle and ſheep. In mountainous countries, where ſnow ſometimes lies upon the ground for many weeks together, the benefit that may occaſionally be derived from ſuch plantations will be very great; and the larger branches that are left make excellent fire wood in ſuch caſes.

In ſome diſtricts where the ſoil is of the loamy and better kinds, there are often large plantations of the fruit-tree, as the apple, pear, and other ſorts, in the fields, hedge-rows, &c. See Orchard.

Plantation *Skreens*, are ſuch tracts or plats of planting as are made round plantations or other woods, for the purpoſes of ſkreening, protecting, and promoting the growth of their timber trees or underwood.

They are particularly beneficial in theſe ways, in many expoſed ſituations, as well as for defending the animals from the cold and cutting blaſts which ſweep over them, as they render the climates of ſuch regions more mild and warm, giving a ſoftneſs to the air in ſuch expoſures.

PLANTE-Ver, in *Natural Hiſtory*, the name of a herb ſent over from China, where it is called *hiatſaotonetchom;* that is to ſay, a plant which at a certain time of the year changes into a worm. The Chineſe ſay, that this is a plant during the ſummer ſeaſon; but that in winter its ſtalk dies, and the root becomes a worm. M. Reaumur has well obſerved, that in the preſent improved ſtate of natural knowledge, we can give no credit to ſuch marvellous accounts; and of the roots ſent over to the Academy at Paris, it appeared, that only a certain part of each was to undergo this change: this, however, if true, was no leſs a marvel than that the whole ſhould.

Father Parenin, who ſent it to France, obſerves, in his account of it, that it was a very ſcarce plant even in China; being found only at the palace of Pekin there, where alſo it was not native, but brought from the mountains of Tibet, and ſome other places on the confines of the Chineſe dominions. This father had never ſeen the leaves or flowers of the plant, but only its roots, which were in high eſteem there, not only becauſe of their miraculous changes, but from their poſſeſſing the virtues of the famous ginſeng; but with this advantage, that the uſe of them was not ſubject to be attended with thoſe hæmorrhages which frequently affected the perſons who take large quantities of that famous root. The roots of this plante-ver are uſually about a quarter of an inch thick, and from an inch to three inches in length; but there are much larger in the places where they grow.

Theſe roots had nothing particular in their figure or appearance; but with theſe the father ſent ſome of thoſe which were ſuppoſed to be changed into worms, concerning which he obſerved, that nothing could more exactly expreſs a worm or caterpillar; the head, the eyes, the feet, and the mouth, being all plainly diſtinguiſhable, as well as the ſeveral folds and cuttings-in of the body. This account was found to be perfectly true; but the miſtake was the want of proper accuracy in the obſervation; for this body, which was ſuppoſed to be the root transformed, had in reality never been any part of the plant, but was found to be really and truly a caterpillar.

This was one of the underground kind, or at leaſt of thoſe which go into the ground to paſs their transformation: of theſe we have a great many different ſpecies in all parts of Europe, and ſome of them, when they are entering into their nymph ſtate, have a cuſtom of faſtening themſelves to the roots of plants. Of this kind was the Chineſe inſect, which, when the time of its change approached, always ſelected the roots of this plant as of a proper ſize and dimenſion for its purpoſe; and, gnawing off the end, hollowed away the ſtump, ſo as to introduce its tail into the cavity; where it remains covered with the bark of the root, which ſo nicely joins to it, that people who obſerve it in a ſlight way cannot but miſtake it to be a part of the root, or the remainder of the root a continuation of its body. The more accurate naturaliſts will, however, eaſily diſtinguiſh the vegetable fibres, which make up the root from the animal ones of the caterpillar; and to an eye accuſtomed to ſuch reſearches, the nice joining of the tail to the remainder of the root will eaſily diſcover itſelf. Mem. Acad. Par. 1720.

PLANTED Coat, in the *Manege*. See Hair.

PLANTIN, Christopher, in *Biography*, an eminent printer, born at Mont-Louis, near Tours, in 1514, learned his art under Robert Mace, printer at Caen in Normandy. He ſettled at Antwerp, where he formed a conſiderable eſtabliſhment; and at length he became one of the moſt eminent printers of the age. He publiſhed a number of important works, to the prefaces of which he has ſubſcribed his name, yet it is aſſerted, that he had no pretenſions to learning, and could not even read Latin. If, however, he was defective himſelf, he employed able and accurate correctors of the preſs, who brought his editions of literary works to great repute. The moſt celebrated performance that came from his preſs was a Polyglott bible, printed after that of Alcala. In the courſe of his trade he acquired large property, which he freely employed for the ſervice of learning and its votaries. He died at Antwerp in 1589, with the title of arch printer to the king of Spain. He poſſeſſed a fine library, which he bequeathed to his grandſon Balthazar Moret. It was the cuſtom of this period for every printer of reputation to adopt a motto, which he inſerted in the title-pages of his works. The deviſe of Plantin was a pair of compaſſes, with the motto "Labore et Conſtantia." Moreri.

PLANTING, in *Gardening*, the operation of inſerting plants of the fruit-tree and other kinds, ſeeds, and roots, into the earth, for the purpoſe of vegetation and future growth.

There are various methods of performing this buſineſs in practice for different ſorts of plants, ſeeds, and roots; as hole planting, trench planting, trenching-in planting, ſlit or crevice planting, holing-in planting, drill planting, bedding-in planting, furrow planting, dibble planting, trowel planting, planting with balls of earth about the roots, planting in pots, &c., all of which are occaſionally uſed by different practitioners in the ſeveral branches of gardening, according as the methods are moſt proper for different particular ſorts of plants.

In the firſt, or Hole Planting, which is the principal method practiſed with moſt ſorts of trees and ſhrubs in the full ground, and which is performed by opening with a ſpade round holes in the earth, at proper diſtances, for the reception of the plants, each hole ſhould be dug large enough to admit all the roots of the tree or ſhrub freely every way to their full ſpread, without touching the ſides of the hole, and about one ſpade deep, or a little more or leſs, according to the ſize of the roots and nature of the ſoil, ſo as, when planted, the uppermoſt ones may be only about three or four inches below the common ſurface, or as low as they were before in the ground; though in very humid ſoils, where the water is apt to ſtand, the holes ſhould be ſhallower, ſo as the uppermoſt roots may ſtand full as high as the general level, or higher if neceſſary, raiſing the ground about them, eſpecially when performed in winter. When the ſoil has been thus dug out, the bottoms ſhould be well looſened; the mould in digging out being laid in a heap cloſe to the edge, in order to be ready to fill in again. The holes being thus prepared, and having ſlightly trimmed the roots, &c. of the trees, one tree or plant muſt be placed in the middle of the hole, making all its roots ſpread equally around; a perſon holding the plant erect by the ſtem, while another with the ſpade caſts in the earth about the roots, taking particular care to break all large clods, and trim in ſome of the fineſt mould firſt all round the roots in general, ſhaking the tree occaſionally, to cauſe the fine ſoil to fall in cloſe among all the ſmall root fibres; and where the tree ſtands too deep, ſhake it up gently to the proper height, and having filled in the earth to the top of the hole, it ſhould be trodden gently all round, firſt round the outſide to ſettle the earth cloſe to the extreme roots, continuing the treading gradually towards the ſtem, to which the mould ſhould be preſſed moderately firm, but no where too hard, only juſt to ſettle the earth, and ſteady the plant in an upright poſition: then all the remaining earth ſhould be pared in evenly round the tree, to the width of the hole, raiſing it ſomewhat above the general level of the ground, to allow for ſettling, giving it alſo a gentle treading; and finiſhing it off a little hollow at top, the better to receive and retain the moiſture from rains, and giving occaſional waterings in ſpring and ſummer, eſpecially for the choicer kinds of trees and ſhrubs.

After this, in winter, or early in ſpring, it may be of advantage to the choicer kinds of trees and ſhrubs, to lay ſome long mulch at top of all the earth, both to keep out the winter's froſt, and prevent the drying winds and drought of ſpring and ſummer from penetrating to the roots before the trees are well rooted in their new ſituations. But ſome, inſtead of mulch, uſe graſs turfs turned upſide down, eſpecially when planting upon graſs ground, or any out-plantations, where turfs of graſs can be obtained; or in orchards, where the ground is in graſs; in which caſe it may be proper to bank ſome turfs round the ſides and top of each hole, particularly for large trees; which will ſteady them more effectually, as well as preſerve the moiſture, if much dry weather ſhould happen the ſucceeding ſummer.

In the ſecond, or Trench Planting, which is a method ſometimes practiſed in the nurſery, in putting out ſeedling and other ſmall trees and ſhrubs in rows; and alſo uſed for box edgings, as well as ſometimes for ſmall hedge-ſets, &c. and always in ſetting out aſparagus; it is performed by opening a long narrow trench with a ſpade, making one ſide upright, then placing the plants againſt the upright ſide, and turning the earth in upon their roots. When uſed for young ſeedlings, or other ſmall trees, ſhrubs, &c. the ground is previouſly trenched or dug over: a line is then ſet, and with a ſpade held with its back towards the line, a narrow trench ſix or eight inches deep is cut out, turning the earth from the line, making the line ſide nearly perpendicular: the plants are then inſerted in the trench at ſmall diſtances, cloſe to the upright ſide, covering in the earth about the roots in planting them; and having planted one row, the earth ſhould be evenly trodden in all the way along, to ſettle it cloſe, and fix the plants ſteady, proceeding from row to row in the ſame manner.

But in planting larger trees, in the nurſery way, by this method, a larger trench will be requiſite; ſometimes a trench one or two ſpades wide, with proportionable depth, according as the roots of the trees require, is made; and having opened it all the way along the intended row, the trees are placed along the middle of the trench, filling in ſome earth to each tree, as placed, one perſon holding it erect, whilſt another throws in the earth; and having placed one row, trim in all the remaining earth evenly; then treading it cloſely all the way to fix the plants ſteady, and in a perfectly upright manner.

In the third, or Trenching-in Planting, which is alſo ſometimes practiſed in light pliable working ground, for young trees in the nurſery way, and ſometimes with edge-ſets, &c., being performed by digging along by a line, about one ſpade in width, and planting at the ſame time; a line is ſet; and then having the plants ready, with a ſpade begin at one end, and ſtanding ſideways to the line, throw out a ſpit or two of earth; which forming a ſmall aperture, another perſon being ready with the plants, he directly depoſits one in the opening, while the digger proceeds with the digging one ſpade wide, covering the roots of the plants with the earth of the next ſpit; and another aperture being thus formed, another plant is placed in: the digger, ſtill proceeding, covers its roots, as before, with the next ſpit of earth; and ſo on to the end of the row, placing them at about a foot, or fifteen or eighteen inches aſunder, according to the ſize of the plants. When larger trees with more ſpreading roots are uſed, inſtead of digging the trench only one ſpade wide, two may probably be requiſite for the proper reception of the roots; likewiſe, in forming the openings for the plants, they ſhould be made large enough to receive the roots freely, digging the earth over them as above. After having planted one row of plants, the earth ſhould be trodden evenly along to ſettle it to the roots, and ſteady the plants in an upright poſition. There is another method of this ſort of planting, ſometimes uſed for ſome ſorts of roots, ſuch as horſe radiſh ſets, potatoes, &c., which is performed by common trenching, placing a row of ſets in each trench. The horſe radiſh ſhould be planted in the bottom of the open trench, twelve inches in depth, turning the earth of the next over them; and the potatoe ſets be placed about from four to five or ſix inches deep, covering them alſo with the earth of the next trench.

In the fourth mode, or that of Slit Planting, which is performed by making ſlits or crevices with a ſpade in the ground, at particular diſtances, for the reception of ſmall trees and ſhrub plants, a ſlit is made for each plant, which is inſerted as the work proceeds; and is practiſed ſometimes in the nurſery way, &c., in putting out rows of ſmall plants, ſuckers, &c., at from about a foot to eighteen inches or two feet high, and which have but ſmall roots: it is alſo ſometimes practiſed in out grounds, where large tracts of foreſt trees are planted, and which are planted out at the above ſizes, and in the moſt expeditious and cheapeſt method.

It is performed in this manner: a line is ſet, or a mark made; and then having a quantity of plants ready, they are planted, as the work proceeds in making the ſlits. A man, having a good clean ſpade, ſtrikes it into the ground with its back cloſe to the line or mark, forming a crevice, taking it out again directly, ſo as to leave the ſlit open, giving another ſtroke at right angles with the firſt; then the perſon with the plants inſerts one immediately into the ſecond-made crevice, bringing it up cloſe to the firſt; and directly preſſes the earth cloſe to the plant with the foot; proceeding in the ſame manner to inſert another plant; and ſo on till all is finiſhed; which is a very expeditious way of putting out ſmall plants, for large plantations, but ſhould never be employed, where other better methods can be uſed.

A man and a boy in this method will plant out ten or fifteen hundred plants, or more, in a day.

In

In the fifth, or Holing-in Planting, which is fometimes ufed in the nurfery, in light loofe ground: alfo, fometimes with potatoes, &c., in pliable foils; the ground being previoufly dug or trenched, and a line placed: it is thus performed; a perfon with a fpade takes out a fmall fpit of earth, to form a little aperture, in which another perfon directly depofits a plant, &c., the digger at the fame time taking another fpit at a little diftance, turns the earth thereof into the firft hole over the roots: placing directly another plant in the fecond opening, the digger covers it with the earth of a third fpit, and fo on to the end of the row.

In the fixth, or Drill Planting, which is by drawing drills with a hoe from two to four or five inches deep, for the reception of feeds and roots, and is a convenient method for many forts of large feeds, fuch as walnuts, chefnuts, and the like; fometimes alfo for broad beans, and always for kidney beans, and peas; likewife for many forts of bulbous roots, when depofited in beds by themfelves; the drills for thefe fhould be drawn with a common hoe, two or three inches deep; and for large kinds of bulbous roots, four or five inches in depth, covering in the feeds and roots with the earth, always to the depth of the drills.

In the feventh, or Bedding-in Planting, which is frequently practifed for the choicer kinds of flowering bulbs, fuch as hyacinths, &c., alfo for the larger feeds of trees, as acorns, large nuts, and other large kinds of feeds, ftones, and kernels: it is performed by drawing the earth from off the tops of the beds fome inches in depth, then planting the feeds or roots, and covering them over with the earth, drawn off for that purpofe; for which the ground fhould be previoufly dug or trenched over, raked, and formed into beds three or four feet wide, with alleys between; then with a rake or fpade trimming the earth evenly from off the top of the bed into the alleys, from two or three to four inches deep for bulbous roots, and for feeds, one or two, according to what they are, and their fize; afterwards, for bulbous roots, drawing lines along the furface of the bed, nine inches diftance, placing the roots bottom downward, along the lines, fix or eight inches apart, thrufting the bottom into the earth: but when for feeds, they may be fcattered promifcuoufly; and having thus planted one bed, then with the fpade let the earth, that was drawn off into the alley, be fpread evenly upon the bed again over the roots or feed, &c., being careful that they are covered all equally the above depth, raking the furface fmooth and fine.

This method is in occafional practice, in planting feveral kinds of the larger prime forts of bulbous-rooted flowers in beds; and nurferymen alfo practife it in planting many of their larger feeds, nuts, &c.

And another method of this kind is occafionally practifed in fome parts, particularly for planting potatoes in low wet grounds, which is by dividing the ground into beds, four feet wide, with alleys two or three feet in width; then digging the beds, and placing the potatoe-fets in three rows along each bed, a foot afunder in the rows: this done, the alleys are dug one fpade depth, cafting the foil upon the beds over the fets, fo as to cover them four or five inches deep; in this way, where the ground is very wet, the alleys drain the moifture from the beds, fo as fometimes to afford great crops. Sometimes, in low moift grounds, that are in grafs or fward, the beds are marked out as above, and without digging the ground; placing the potatoe fets immediately upon the fward, then digging the alleys, firft turning up the fward, and placing it topfy-turvy upon the bed, fo as to be fward to fward over the fets; then finifhing by applying more earth from the alleys, to cover in the fets, the proper depth of four or five inches. This, in fome counties, is called the lazy-bed method, becaufe the ground is not dug over.

In the eighth, or Furrow Planting, which is by drawing furrows with a plough, and depofiting fets or plants in them, covering in alfo with the plough: it is fometimes practifed for planting potatoe-fets in fields, and has been adopted in planting young trees for large tracts of foreft-tree plantations, where the cheapeft and moft expeditious method is required; but this method can be practifed only in a light pliable ground, and is performed thus: a furrow being drawn, one or two perfons are employed in placing the fets or plants in the furrow, whilft the plough following immediately with another furrow, turns the earth upon the roots of the plants. This is not a mode to be much advifed.

In the ninth, or Dibble Planting, which is the moft commodious method for moft forts of fibrous-rooted feedling plants, particularly all the herbaceous tribe; alfo for flips, offsets, and cuttings both of the herbaceous and fhrubby kinds; likewife for fome kinds of feeds and roots, fuch as broad beans, potatoe fets, Jerufalem artichokes, and horfe-radifh fets, with numerous forts of bulbous roots, &c.; it is expeditioufly performed with a dibble or fetting-ftick, by making a narrow hole in the earth for each plant, inferting one in each hole always as the work proceeds.

Having a dibble or fetting-ftick, it is ufed by thrufting it into the earth in a perpendicular defcent, in depth as the particular plants, &c. may require; directly inferting the plant, feed, or fet, as each hole is made, clofing it immediately by a ftroke of the dibble. In fetting any kind of plants, flips, cuttings, &c., having long fhanks or ftems, it is proper to make holes a proportionable depth, to admit them a confiderable way in the ground: for example, cabbage-plants, favoys, &c. fhould be planted down to their leaves; flips and cuttings fhould be inferted two parts of three, at leaft, in the ground; being particularly careful in dibbling-in all forts of plants, to clofe the holes well in every part about the roots; by ftriking the dibble flantways into the ground, fo as to ftrike the mould firft firmly up to the root and fibres, at the fame time bringing it clofe to the ftem. See Dibble.

In the tenth mode, or Trowel Planting, it is performed with a garden trowel, made hollow like a fcoop, and is ufeful in tranfplanting many forts of young fibrous-rooted plants with balls of earth about their roots, fo as not to feel their removal.

The trowel is employed both in taking up the plants and planting them.

In the eleventh, or Planting with Balls of Earth about the Roots, which is the removing of the plant with a large ball of earth about its roots, fo as by having its roots firmly attached to the furrounding earth, it ftill, during the operation, continues its growing ftate, without receiving any, or but very little check from its removal: this is often practifed more particularly for the more delicate and choicer kinds of exotics, trees, fhrubs, and herbaceous plants; and occafionally for many of the fibrous-rooted, flowery plants, annuals, perennials, and biennials, even in their advanced growth and flowering ftate, when particularly wanted to fupply any deficient compartments; though it is not fo eligible for bulbous-rooted kinds: likewife, when intended to remove any fort of tree or plant out of the proper planting feafon, as very late in fpring, or in fummer, it is proper to tranfplant it with a good ball of earth, to preferve it more certainly in a ftate of growth. Some trees and fhrubs are more difficult to remove with a ball than moft kinds of the herbaceous fibrous-rooted plants, though

though many of the tree and ſhrub kinds having very fibry roots, alſo readily riſe with good balls.

In tranſplanting any of the tree and ſhrub kinds by this method, if they grow in the full ground, the operator muſt be careful to begin to open a trench with a ſpade at ſome diſtance from and round the ſtem, perhaps a foot, or two or three, according to the ſize of the tree and expanſion of the roots, digging a ſort of trench all round, a ſpade or two wide, or more if large trees, and in depth below all the roots; all the time having great care not to diſturb the ball or maſs of earth between the ſtem and trench, but preſerve it as entire as poſſible. When the whole has been detached, the plant ſhould be removed into the ſituation for which it is intended, with the whole of its ball about its roots.

When trees or ſhrubs, with balls to their roots, are intended to be ſent to conſiderable diſtances, they ſhould be placed ſingly in oſier baſkets, in order to preſerve the ball, having a baſket for each tree; the baſkets to be of an upright make, in width and depth in proportion to the ball, with two handles at top, eſpecially if large, and generally worked rather open at the ſides, as ſometimes the baſket and all is placed in the ground, when the plant cannot be readily removed without danger of breaking the ball of earth about it.

In reſpect to the method of planting in pots in general, having the pots and mould ready for the reception of the plants, previous to planting them place ſome pieces of tile, pot-ſherds, or oyſter-ſhell, &c. over each hole at the bottom of the pots, to prevent the holes being clogged and ſtopped with the earth, and the earth from being waſhed out with occaſional waterings; alſo to prevent the roots of the plants getting out: then having ſecured the holes, put ſome earth in the bottom of each pot, from two or three to five or ſix inches or more in depth, according to the ſize of the pot, and that of the roots of the plant; then inſert the plant in the middle of the pot upon the earth, in an upright poſition, making its roots, if without a ball of earth, ſpread equally every way; directly adding a quantity of fine mould about all the roots and fibres, ſhaking the pot to cauſe the earth to ſettle cloſe thereto: at the ſame time, if the root ſtand too low, ſhake it gently up; and, having filled the pot with earth, preſs it gently all round with the hand, to ſettle it moderately firm in every part, and to ſteady the upright poſture of the plant, raiſing the earth however within about half an inch, or leſs, of the top of the pot, as it will ſettle lower; for ſome void ſpace at top is neceſſary to receive waterings occaſionally: as ſoon as the plant is thus potted, give it directly a moderate watering to ſettle the earth more effectually cloſe about all the roots, and promote their rooting more expeditiouſly in the new earth; repeating the waterings both before and after they have taken root, as occaſion may require.

In tranſplanting plants in pots from one pot to another, they may in general be ſhifted with the whole ball of earth contained in the pot about their roots entire, ſo as to preſerve the plant all along in its growing ſtate, as ſcarcely to ſhrink or retard its growth by the operation; for plants growing ſingly in pots, and of ſome ſtanding, whoſe roots and fibres have eſtabliſhed themſelves firmly in the earth, will readily remove out of the pots with the entire ball in one compact lump, ſurrounding all the roots and fibres, retaining their growing ſtate by ſtill drawing nouriſhment from the ſurrounding ball of earth.

The removing of plants from one pot to another with balls, is in ſome caſes to be avoided; as where a plant appears diſeaſed or in a bad ſtate of growth, as it is moſt probable the fault is in the root of the earth; therefore, it is eligible to ſhake the whole entirely out of the earth, in order to examine its roots; and trim off all decayed and other bad parts; then, having a freſh pot, and ſome entire new compoſt, replant the tree, &c. therein.

In potting plants from the full ground, or beds of earth, &c., if they have been previouſly pricked out at certain diſtances, and have ſtood long enough to fix their roots firmly, many ſorts may be potted with balls, particularly moſt of the herbaceous, fibrous-rooted kinds, and many of the ſhrubby tribe, by taking them up carefully with the garden trowel, or with a ſpade, as may be convenient, according to the ſize of the plants; and, if neceſſary, pare the balls round to fit the pot.

Seedling plants, or thoſe raiſed from ſeed beds, by their growing ſo cloſe together, rarely admit of potting with balls to their roots; ſo that when it is intended to pot ſuch, they muſt be drawn out of the earth with the root as entire as poſſible, and be potted ſeparately in ſmall pots, ſhifting them occaſionally into larger.

Sometimes in pot-planting, to ſave room, and for other purpoſes, ſeveral ſmall plants are planted in each pot, eſpecially when deſigned as nurſery-pots, to receive either ſmall ſeedlings, offſets, ſlips, cuttings, &c., juſt to ſtrike them, and forward them a little at firſt, either in hot-beds, or for removing them to different ſituations, ſuch as occaſional ſhade, ſhelter, &c., and in which ſome ſorts of ſmall ſlips and cuttings are ſometimes planted many together, in one or more wide pots, eſpecially where large ſupplies of ſome particular ſorts are required, ſuch as myrtle cuttings and pipings of pinks, &c., ſometimes to the amount of a hundred or two of theſe ſmall ſets in one capacious pot or wide ſtore pan. The ſmall ſeedlings, ſlips, cuttings, offſets, &c., when they are a little forwarded, or properly rooted, and ſhoot a little at top, ſhould be all potted off, in proper time, each in a ſeparate pot, eſpecially if plants of any duration; giving them ſmall pots at firſt, and as they increaſe in ſize ſhifting them into larger ones.

When any large growing plants, ſuch as orange and lemon trees, or any other kinds, are become too large for pots, they ſhould be ſhifted into tubs: theſe tubs ſhould be made of full-inch thick ſtaves, and adapted to the ſize of the reſpective plants; each tub to be well hooped with iron, and furniſhed with two hooked or bow iron handles at top, by which to move them, either by hand, or, when very large tubs, to receive poles between two men for moving the plants where wanted; having holes at the bottom of the tubs to diſcharge the ſuperfluous moiſture; placing ſome ſtones, &c. to prevent the holes being clogged with the earth; the method of planting and tranſplanting being the ſame as in pot planting.

The twelfth Method, or Planting in Pots, is practiſed to all tender exotics, in order for moving them to ſhelter occaſionally, ſuch as all kinds of green-houſe and hot-houſe plants; and likewiſe for many ſorts of hardy flowering plants, for the convenience of moving them occaſionally to adorn particular compartments; and for the convenience of moving ſome curious ſorts when in flower to occaſional ſhelter from the ſun's rays and exceſſive rains, in order to preſerve their beauty and prolong the time of their bloom; ſuch as the fine auriculas, carnations, &c.

In planting in this way, it is highly requiſite carefully to adapt the ſizes to the ſize and nature of the different plants intended to be potted: if ſmall plants, begin firſt with ſmall pots, one plant only to each pot, eſpecially if to remain; but according as the different plants advance in growth ſhift them into pots one or two ſizes larger, which may be requiſite to many ſorts once a year, to others once in two or three years, according to circumſtances.

Garden

Garden pots for this ufe are of feveral regular fizes, from two to fixty in a caft, diftinguifhed at the pot-houfes accordingly; as twos, fixes, twelves, fixteens, twenty-fours, thirty-twos, forty-eights, fixties, or fixty-fours, &c., each pot having one or more apertures at bottom to difcharge the fuperfluous moifture. They are fold by the potters at fo much *per* caft; large and fmall, all of a price; thofe of only two in a caft the fame as thofe of fixty; and from two fhillings to half a crown or three fhillings *per* caft is the general price. See POT, *Garden*.

Sometimes, inftead of bafkets, fmall young trees and other plants with balls, intended to be fent to any diftance, are put feparately in pots, and when they are to be placed in the full ground, each fhould be turned out of the pot with the ball entire.

Trees and other plants that have generally grown in pots, where they have been of fome ftanding, have the whole earth by means of the numerous fibres formed into one compact lump, fo that it will readily come out entire and firm; or to fuch as do not fo eafily quit the pot, a long blade of a knife, or fome other thin inftrument, may be thruft down between the outfide of the ball and pot all round, and it will then readily come out, either in drawing by the ftem of the plant, or by ftriking the edge of the pot with fomething; or, if fmall plants, you may turn the pot mouth downward, and ftrike the edge gently againft any firm fubftance. In replanting thofe potted plants, if the fides of the ball of earth are much matted with the fibres of the root, it is proper to pare off the groffeft part, together with a little of the old earth, efpecially if to be planted in pots again; then put it in a pot a fize larger than before, filling up all round with frefh mould, finifhing with a moderate watering.

With refpect to the proper ftate and preparation of trees for planting, it may be obferved that young trees, both of the fruit and foreft kinds, are the moft fuitable, and fucceed beft, as from three or four to fix or eight feet in height, and from three or four to five or fix years old. See FOREST, DWARF, and STANDARD TREES.

In foreft-trees, the ftraighteft, moft vigorous, and thriving plants of the refpective kinds fhould always be chofen.

In preparing for planting, in taking up the trees out of the nurfery, the greateft care is neceffary in raifing them with as great a fpread of root as poffible, which is often ill attended to, efpecially when large orders of plants are to be drawn in a hurry. The ground about the trees fhould always be opened with the fpade widely round the roots, and deep enough to get to their bottoms without hacking and cutting them with the fpade, but fo as to raife each plant with all its roots as entire as poffible. After having taken up the trees out of the nurfery, &c., it is alfo of great moment to have them replanted as foon as poffible in the places allotted for them; for although by properly covering the roots with litter, or, if fent to any confiderable diftance, by tying them in bundles, and packing them up with plenty of ftraw about the roots, and afterwards clofely matted round, they may be preferved in tolerable good condition a fortnight or longer, yet, where it is poffible to plant them the fame day, or in a day or two after, before the fmall fibres are fhrunk or dried, it will be of much advantage in the firft growth of the trees; but when this cannot be done, they fhould be immediately laid in the ground in a trench.

In preparing for planting, the roots muft have occafional trimming, not however to retrench or reduce any but the maimed and decayed parts; therefore previous to planting examine the root, and cut out all fuch parts as have been broken or damaged in taking up, and any cafual decayed parts or other blemifhes, being careful to leave all the found roots every where entire; leaving alfo all the fmall fibres that are frefh and vigorous, only trimming off fuch as are become dry and mouldy; fuffering all the main roots to remain, moftly at full length, except juft to tip off their ends a little on the under fide, floping outward; and reduce any very long ftragglers, and fhorten long perpendicular tap-roots, more particularly of fruit-trees, to prevent their running down into a bad foil, and to promote their throwing out others horizontally.

With regard to the preparation of the heads of the trees, the principal care is to trim off the ftraggling fhoots and branches from the ftems, leaving the heads for the generality entire, only juft retrenching very irregular branches, and fhortening any very long ftragglers; always fuffering the main or leading top fhoot to remain at length, particularly in foreft-treees, and all others that are to grow to a lofty ftature. Fruit-trees, however, fometimes require a more accurate regulation of the head preparatory to planting, particularly dwarfs for efpaliers and walls. If the fruit-tree is taken from the nurfery at one year old from the budding and grafting, and with its firft fhoot from budding and grafting entire, this firft fhoot muft neceffarily be fhortened or headed down to force out lateral wood below, to furnifh the bottom properly; but this heading down is not neceffary at the time of planting, but fhould remain till fpring, until the tree has taken frefh root and begins to fhoot; for the head remaining greatly promotes the rooting; when in March or the beginning of April, head it down within half a foot, or five or fix eyes of the infertion of the bud or graft, and the fhoot fo headed will throw out, from its remaining lower eyes, feveral lateral branches the enfuing fummer.

If it is two, three, or more years old from the budding and grafting, and the firft fhoots were headed down in the nurfery at the proper time, it is proper to plant it with its whole head entire, only retrenching any irregular branch, or any very luxuriant fhoot; or thin out the worft of fuch as are evidently too clofe or crowded, leaving however all the regular branches at full length, except juft to reduce any very long rambler.

For new planting trees it is very improper to retrench the branches too feverely, and cut all that remains fhort, as is very often practifed, on a fuppofition of ftrengthening their roots, which however has often the contrary effect; for the branches and leaves imbibe the refrefhing influence of the air, &c., which, being conveyed to the roots, proves nutrimental, and contributes exceedingly towards vegetation, and confequently promotes the rooting afrefh more expeditioufly and effectually. Befides, by a fevere retrenching, and a general fhortening, of fruit-trees in particular, in moft forts the very parts where fruit would have been foon firft produced are cut off, and it will probably coft the tree two or three years growth to furnifh new branches equal to thofe cut away, as well as retard its bearing in proportion. And it often happens by fuch a general amputation of the branches of all new planted trees at the time of planting, that they, for want of branches to collect vegetative nourifhment, either make very little progrefs in fhooting for two or three years after, or fometimes, when they do fhoot, throw out a profufion of unneceffary wood from the remaining eyes or buds.

Therefore if young fruit-trees at planting, whether dwarfs or ftandards, are furnifhed with five or fix or more good regular principal branches, of one, two, or more years growth, it is improper to retrench any part of them, and disfigure the tree, particularly apples, pears, plums, and cherries, which fhould at all times be but fparingly fhortened; and fince feveral good branches being already obtained in the proper parts to give the head its firft regular form, they in their turn readily furnifh more; and if there is a vacancy in any part, it will be better to endeavour to fill it by ftopping fome of the young fhoots produced the fummer after planting, by either pinching or pruning them in May or June the fame year to three or four eyes, or cutting them down to that length in the winter or fpring following. Some fruit-trees, however, fuch as peaches, nectarines, &c., againft walls, require moft of their young fhoots to be fhortened annually.

Foreft-trees, &c., in their preparation previous to planting, after being drawn out of the nurfery, fhould only have the blemifhed roots trimmed, and all branches from the lower part of the ftem pruned off, cutting the lower ones clofe, the others to two, three, or four inches, particularly the deciduous kinds, leaving the head always tolerably branchy, and moftly entire; not to trim away all the branches to one leading fhoot only, as is often practifed, but leave a proportionable fhare of the upper more erect branches, to form fome tolerable head, and only juft retrenching the lower ftragglers, very long rambling luxuriants, and very irregular growths, to preferve a little regularity; being particularly careful to leave always the top or leading fhoot perfectly entire, unlefs it is decayed, or is very crooked, bending much downwards, &c., in which cafes, if any ftraight fhoot is conveniently fituated, the crooked part may be retrenched down to the ftraight fhoot, which leave entire to run up in height, as without a leader a tree can never afpire to any confiderable ftature; for the leader, by its annual erect fhoot, gradually increafes the length of the ftem, and, as it advances, fends out a fupply of laterals to furnifh the head, branching and fpreading.

In planting large tall trees, where it is defigned to form fhade, fhelter, or blind as foon as poffible, very little reduction of the branches of the head fhould be fuffered, only to reduce any very irregular growers.

In removing pretty large trees of any fort with confiderable heads, efpecially when very fpreading or crowded, it may be proper to reduce the whole regularly in fome proportion to the root, that the winds may not have too much power to incommode it after planting; in which cafes it may be neceffary to retrench or reduce fome of the moft extenfive lower branches, and thin out fome where much crowded, reducing others down to fome convenient lateral branch they may fupport, fo as each reduced branch may, notwithftanding its reduction, terminate in a leader, having its top entire, not to exhibit naked ends of branches, ftanding up like ftumps.

In refpect to the preparation for planting of all the fhrub kind, only juft trim the ftraggling under branches and fhoots from the lower part of the ftem, retrenching any luxuriants of the heads that feem to fhoot away very irregularly and vigoroufly at the expence of the neighbouring branches, and reducing long ramblers, &c., juft to preferve a little regularity.

All new planted tall trees fhould be ftaked as foon as planted, in order to fupport them fteady every where till they are well rooted and have fomewhat eftablifhed their roots, that winds may not overfet, or otherwife incommode them; particularly all trees of fix, eight, or ten feet high, and upwards; one tall ftout ftake being placed to each tree, or more, if the trees are of large fize, fharpening the lower ends, and driving them firmly into the ground near the ftem; or if larger trees, place it flantways, at a little diftance, fo as its top reach the upper part of the ftem, on the oppofite fide to that moft expofed to the winds, in which it will have the greateft effect; but large trees with full heads, fhould generally have very tall ftrong ftakes, three to each tree, placed triangular-ways, in an oblique or flanting direction, afterwards binding the ftems of the trees firmly to the ftakes, previoufly wrapping fome foft fubftance, fuch as hay-bands, &c., round them, at the part where it is to be faftened to the ftakes, in order to fave the bark from being rubbed off againft the ftakes by the motion of the winds, which is more particularly neceffary to tall plants that are much expofed. Large trees of confiderable ftature, with full heads, are often fupported with ropes fufpended from the top of the ftem three different ways, ftraining them tight, and the end of each rope ftaked fecurely down to the ground; fo that whatfoever way the wind blows the ropes ftay the tree ftill in its upright pofition.

Such new planted trees as are expofed to cattle fhould each be well fortified all round the ftem with thorn bufhes, briars, furze, &c.

The general feafon of planting, for all forts of trees, is autumn and fpring, as from the beginning of the decay of the leaf, in October, until December, for the former; though evergreens may be begun to be tranfplanted towards the middle or latter end of September, and continued till December. And for the fpring planting, February and March are the principal time, but may be continued occafionally until April; and feveral forts of tender young evergreens fucceed beft when planted the beginning of that month, or later. Much, however, in this bufinefs, muft depend on the foil and ftate of the weather.

In preparing to plant herbaceous fibrous-rooted plants, care is to be had to remove them with good roots; young feedlings, &c., efpecially require particular care in drawing them with proper roots. When they are to be taken all clean up, they may be readily loofened and raifed out of the earth with fome inftrument with all their fibres entire; but when they are only to be thinned, they do not admit of this, as it would difturb the remaining plants, fo muft be drawn out by hand carefully, with as much root as poffible.

Many forts of fibrous-rooted plants, however, are fo hardy, and apt to grow, that if taken up almoft any how, with a little root, they will ftrike; it is neverthelefs advifeable to ufe care in drawing all forts for planting with tolerable roots, as they will, in proportion, make more progrefs in their future growth. And as to any trimming preparatory to planting, very little is wanted, only in fome forts, juft fhortening very long naked fpindly roots, and trimming any ftraggling fibres; though in numbers of plants of this tribe hardly any trimming at all is required, either in root or top.

Planting *Timber Trees*, in *Rural Economy*, the act of making plantations with thefe forts of trees, which is a practice that has lately been more attended to than formerly; probably from the advantages of it being more fully underftood, and more correctly afcertained. The particular forts of land that may be converted to this purpofe with the greateft chance of profit, have been already pointed out.

In the accomplifhing the bufinefs, the principal difficulty confifts in properly adapting the trees to the nature of the foil, as, unlefs that be the cafe, the fuccefs is far from fo great as it would otherwife be. The land fhould alfo be in a proper ftate of preparation for the reception and growth of the trees, and the work be executed at a proper feafon in a proper manner, and at fuitable diftances, according to the nature and quality of the foil, and that of the trees; the whole being well fenced from the attacks of cattle.

Soil.—The particular kinds of foil beft adapted to the cultivation of the different forts of timber trees, and in which fome or other of them will be found to grow in the moft perfect manner, are gravelly or light fandy foils, with free porous fubfoils; gravelly or fandy loams on porous fubfoils; loamy,

loamy, sandy, or gravelly soils on retentive subsoils; gravelly, chalk or chalky loams on porous subsoils; loamy clays or clayey loams on porous subsoils; and strong clayey or loamy soils on retentive subsoils. Likewise, thin moorish heathy soils on gravelly or porous subsoils, also on clay or retentive subsoils; and besides these kinds of land, there are, as has been seen above, many other thin poor sorts of waste, in different parts of the kingdom, which are not fit for raising any other descriptions of plants, that might be converted with great advantage to this purpose, as the diminution in the quantities of timber and other wood every where now almost begins to be seriously felt.

Mr. Smith, in the "Survey of Argyleshire," states, that the grounds there which ought to be marked out for this improvement, are such as are mentioned below. The best land would no doubt bear timber best; and if arable land could be spared for the purpose, the return might be expected to be in proportion to the value of the soil. But in this county little or no arable land, meadow, or good pasture, ought to be laid under planting. It should have only those waste grounds which are capable of this improvement, and of no other. And of these we may reckon, first, those extensive dry mosses and moor-lands, in the hollows and on the declivities of hills, especially in the inland parts of the county. These lands are generally covered with short heath, mixed with so little grass, that they are not worth *6d.* the acre. The trunks of trees generally found in them give, however, a sufficient proof of their aptitude to grow timber, and they can never be turned to better account than by planting them; and that with the same kind of timber that is found in them. This is generally fir, and sometimes oak. Whatever it be, follow nature, and you cannot err. It may be said that some of these situations are far from water-carriage. But the whole county is so indented with seas, and so well accommodated with roads, that almost every mountain is accessible by the one or the other. Or, if any of them be not, still it may be profitable to plant it, were it only with a view of converting a great part of the wood to the purposes of extracting from it turpentine, tar, pitch, rosin, and of making pot-ashes. And another kind of ground which ought to be planted, and of which we have large tracts, is that which is covered with brush-wood, such as hazel, birch, &c. seldom allowed by the cattle to rise above two or three feet high. Here nature, which could not be mistaken in the soil, has planted wood, though it has not been allowed to grow, and has marked out the ground as fit for planting. This brush-wood will prove an excellent nurse to young plants, by giving them shelter till they raise their heads above it; after which they will destroy the brush-wood by excluding the sun and air from it, and reduce it to a manure which will help their growth. Among this brush-wood, however, there may sometimes be found some sprouts of oak and ash, which ought to be cut over a few inches above the ground; after which they will shoot up, and thrive exceedingly, from the abundance of roots which they have to nourish them. Patches of dwarfish oak, which the cattle never allow to rise one foot from the ground, are also common in many parts of the county. If these spots were brought within the enclosure of a plantation, and the bushes cut over a little above the surface of the ground, they would soon be valuable. In England, even oak plants are often cut in this manner after one or two years, when they have taken to the ground, and the second shoot is trusted to for the tree; as it is found to grow with greater luxuriance than the first, which was checked by transplanting.

Stools of natural wood, wherever they are, furnish much room for planting; and at a trifling expence, when they are already enclosed. Every vacancy in them ought to be filled up with oak, ash, elm, and other valuable kinds of timber. The ground is suitable for planting; the natural wood will shelter it; and thus it will thrive well, and improve the coppice. The properest time for improving a natural wood with planting, is immediately after it is cut, when the fences are in best repair, and when the sun and air will get at the plants which may be set among bushes of less value. These bushes should afterwards be cut down, if they are found to hinder the growth of the planting. The duke of Argyle has done much in this way, and lord Stonefield, sir James Campbell, and several other proprietors, have thus improved their natural woods very considerably. In one year, captain Campbell, of Kintarbet, with a spirit yet uncommon amongst the most of the proprietors of this county, planted among his natural woods no less than 20,000 trees of valuable timber. At this rate, he will, in a few years, lay the foundation of a sure and large fortune.

And a fourth kind of ground, that should be devoted to planting in this situation, is, that on which a number of venerable native firs are still growing. These memorials of our former forests are not unfrequent in some of the upper parts of the county, particularly in Glenety and Glenurchay; and they deserve more attention than they have hitherto met with. From the seed which they shed in winter, and which is driven to a distance by the storm, a beautiful plantation rises up in the spring; but when the cattle are driven up to the mountains in summer, this precious crop, the hope of future forests, is for ever destroyed. This is the more to be regretted, as the quality of this fir is so excellent, as not to be surpassed by any in the world. The seed of this fir is precious, and a single cone of it, if possible, should not be lost. But then, in order to preserve its valuable quality, it should be sown where it is meant it should grow, without passing through the medium of a seed-bed or nursery. And it appears necessary, in order to preserve the quality of the timber, that we should follow nature, and sow the seed directly where we intend the tree should grow. The seed too will thrive where plants would fail.

After some hesitation about parting with any thing we call arable ground, he mentions one other kind of land, which it may sometimes be proper to devote to planting. He means some high fields, which, under the old system of cultivation, were subject to the plough, but never to much advantage. These poor gravelly fields were manured by folding cattle on them at night. But now, where this system is given up, they lie neglected, and many of them are already covered with heath. With little expence, and much advantage, they might be converted to plantations. The earthen dikes which surround them might be faced with stones, of which the dikes themselves would furnish a great proportion. The tops of the dikes might be planted with firs, if not with quicksets, for more fence and shelter. The fields should then be ploughed, and, if at all convenient, dressed with some lime or other manure, and sown with the seed of the native Scotch fir, and with acorns. By this preparation of the ground, the trees would thrive amazingly, and the wood retain its native quality. There are many thousand acres of waste land in this country as well as Scotland, that might be converted to plantations with great advantage, and which are fit for nothing else.

A tabular view, taken, with some alteration, from the Agricultural Survey of the County of Kent, shewing the nature of the soil in which different sorts of timber trees are found to succeed in the most certain and perfect manner, with the uses to which they may be applied in different cases, is given in the following table.

Surface Soil.	Subfoil.	Common Growth.	Planted Growth.	Ufes of.
Heavy and gravelly loams.	Heavy loam with chalk.	Birch, hornbeam, oak, afh, hazel, beech, &c.	Oak, afh, chefnut, willow, lime, walnut.	Timber, hop-poles, cord-wood, hurdles, bavins for bakers, and lime.
Sandy loams.	Heavy loams.	Birch, hornbeam, oak, afh, hazel, beech, &c.	Elm, beech, Weymouth pine, common fpruce .	Timber, hop-poles, cord-wood, hurdles, bavins for bakers, and lime.
Flinty ftrong loam.	Heavy loam.	Ditto.	Willow and chefnut.	Timber, fencing-poles, and as above.
Gravelly and fandy loams.	Gravelly loam.	Afh, beech, oak, hazel, &c.	Chefnut, afh.	Hop-poles, fencing-poles, and all as above.
Gravelly, fandy and flinty loams.	Heavy gravelly flinty loam.	Afh, beech, hornbeam, and oak.	Afh, beech, larch, &c.	Timber, fencing, hop-poles, cord-wood, for charcoal, bavins, &c.
Flinty dry poor gravelly loams.	Chalk at two feet depth, with gravelly loam.	Beech, oak, &c.	Beech, larch, &c.	Cord-wood, bavins, and hop-poles.
Flinty and gravelly loams.	Chalk four feet, with deep gravelly loam.	Afh, oak, hazel, &c.	Afh, larch, &c.	Cord-wood, hop-poles, bavins, ftakes, ethers, &c.
Ditto.	With a few flints, but nearly as above.	Oak, hazel, beech and afh.	Chefnut, afh, and willow.	Hop-poles, fencing-poles, ftakes, cord-wood, &c.
Lightifh black loam.	Dry fandy gravel.	Birch, elm, afh.	Afh, elm, &c.	Various ufes in hufbandry.
Flinty gravelly loams.	Strong loam, with flints.	Oak, afh, beech, &c.	Afh, &c.	Poles, bavins, cord-wood, &c.
Chalky, flinty gravelly loam.	Chalk, with fome gravelly loam.	Ditto.	Ditto.	Ditto.
Gravelly loam.	Heavy, flinty, and poor loam.	Oak, afh, hazel, and beech.	Afh, oak, &c.	Common produce a few poles, cord-wood, bavins, &c. Plantation many poles, and the above.
Gravelly and chalky loams.	Gravelly loam with chalk.	Oak, afh, &c.	Afh and chefnut.	Poles, cord-wood, &c.
Gravelly loam.	Ditto.	Afh, oak, and beech.	Oak, larch.	Ditto.
Ditto.	Gravelly loam and heavy loam.	Ditto.	Scotch pine.	Ditto.
Sandy gravel.	Gravelly and fandy loam.	Afh, oak, beech, and Scotch pine.	Larch, chefnut, &c.	Poles, ftakes, ethers, &c.
Stone fhatter and gravelly loam.	Strong loam with ragftone.	Oak, hazel, birch, &c.	Birch, oak, &c.	Oaken tillers, fmall timber poles, &c.
	Gravelly loam with fome ftone.	Oak, birch, afpen, hazel, and afh.	Afh, chefnut, and willow.	Fencing-poles, hop-poles, cord-wood, &c.
Gravelly loam.	Gravelly loam, with fome ftones.	Oak.	Chefnuts.	Hop-poles, fence-poles, &c.
Sandy loam.	Gravelly loam.	Birch, oak, hornbeam, &c.	Chefnut, &c.	Fence-poles, hop-poles, &c.
Sandy loam and ftone fhatter.	Gravelly loam with ragftone.	Oak, beech, birch, hazel, afh.	Ditto.	Ditto.
Gravelly loam and ftone fhatter.	Deep loam, heavy clay and gravel.	Ditto.	Ditto.	Ditto.
Ditto.	Gravelly loam.	Ditto.	Ditto.	Ditto.
Gravelly and fandy loam.	With ftrong clay and loam.	Oak and ditto.	Afh, larch, &c.	Poles, fire-wood, &c. as above.
Gravelly loam flinty.	Gravel with clay and fome flint.	Scrubby oak, hazel, &c.	Oak, afh.	Timber and ditto.
Wet fpungy land.	Moift and boggy earth	Alder, willow.	Alder, ofier, willow, &c.	Hurdles, hop-poles, &c.
Drier ditto.	Ditto more dry.	Poplar.	White poplar, willow.	Hop-poles, &c.
Light fandy loam.	Dry gravelly earth.	Mountain afh, afh.	Scotch pine, filver fir.	Hop-poles.
Light gravelly loam.	With dry gravel.	Afh.	Sycamore.	Timber, turnery, &c.

Mr. Nicol ſtates, that in planting, where it is performed on the more elevated or mountainous tracts, warmth and ſhelter are to be conſidered, as without theſe the trees ſeldom thrive in a perfect manner. In ſuch ſituations there is, in general, the moſt difficulty and the leaſt progreſs made in the raiſing of timber trees; the ſucceſs of the planter depending greatly upon fixing on ſuch ſorts of timber trees as may in future become the moſt highly valuable, on planting thickly with plants of not too large a ſize, and on a conſiderable plat, or extent of ground both in length and width being planted. In theſe unfriendly ſituations to the growth of trees, ſmall plants muſt conſequently be choſen and planted thick on the ground; as the winds are very prejudicial to trees of a large ſtature, by looſening the roots, and frequently breaking the fibres; but though this is the moſt diſadvantageous ſituation for planting, it is poſſible, with proper care in the above reſpects, to rear young timber in it. Where it is intended to cover a mountain from its baſe, it will be moſt conveniently done by planting round the baſe in the firſt inſtance, riſing gradually; by which means an artificial ſhelter will be forming, from the progreſs that will be made by the trees that were firſt planted, eſpecially if the extent is ſuch as to require ſeveral ſeaſons to complete the planting. The portion firſt planted ſhould be pretty extenſive, in all ſuch caſes eſpecially where ſhelter is principally intended.

The kinds of trees to be choſen for ſuch ſituations muſt be regulated, in a great meaſure, by the ſoil. The pine would perhaps be found to flouriſh moſt, but the larch is preferable as a nurſe. The mountain-aſh, the beech, the aſh, the ſycamore, the birch, the fir, &c. may all be planted with reaſonable hope of ſucceſs; and where the ſoil is deepeſt and richeſt the oak. But in low ſheltered ſituations, where the inconvenience of expoſure to the winds is obviated, timber-trees may be planted with greater certainty of ſucceſs; the chief care neceſſary in this caſe being to fix on trees of a proper kind, and placing them at proper diſtances, according to their ſorts and ſizes. As theſe ſituations admit of moſt kinds, on the more ſheltered parts, the oak, larch, elm, beech, horſe-cheſnut, walnut, lime, ſpruce, and ſilver fir may be ſuitable; and on the leſs ſheltered portions, the aſh, birch, ſycamore, hornbeam, mountain-aſh, and fir, with a mixture of larch. It may likewiſe be noticed that the banks of rivers and canals are moſtly favourable for the planter's purpoſe, and moſt ſorts of timber and other woods may be raiſed in ſuch ſituations; the oak, elm, poplar, willow and ozier, according as they are more or leſs dry; but the preference muſt depend on the local circumſtances of the different caſes.

But in ſituations near the ſea-coaſt, as they are in general inimical to the growth of timber, the beech and ſycamore will be moſtly found the moſt proper, as bearing the ſea air better than other ſorts. At leaſt they are of great uſe in nurſing the other ſorts of trees till they acquire ſufficient ſtrength. It is adviſed in ſuch places, as the beſt mode of performing the buſineſs, to plant, where the banks riſe high, in the face of them much within the level of the tops, in order to afford a ſcreen for the trees within till they have attained a ſufficient height; but when they are flat, to have recourſe to planting in belts, commencing the work as cloſe to the edge of the water as poſſible, putting the plants in, in a very thick manner in the firſt rows, as at the diſtances of not more than about thirty inches, and uſing ſuch plants as are ſtout, well rooted, and not more than eighteen inches growth.

Raiſing the Plants.—The different methods of providing the plants have been already noticed under the head of PLANTATION; but the moſt uſeful are either by raiſing them in nurſeries near the ſpot to be planted till of proper ſizes, or by purchaſing them from nurſerymen in the neighbourhood. For extenſive tracts of ground the firſt is the moſt advantageous mode, but when only ſmall tracts are to be covered, the latter may often be the moſt adviſeable. In forming the nurſery grounds, great attention ſhould be paid to having them properly ſituated in reſpect to warmth, and the ſoil well broken down and enriched by proper manures. In Nottinghamſhire, in the duke of Portland's extenſive plantations, a well ſituated and ſheltered valley, as contiguous as poſſible, is fixed upon for the purpoſe, and a ſpace of ground ſufficient for the purpoſe is well fenced in; large boarded gates being placed at each end, with a road down the middle proper for admitting carriages to convey away the young trees. When after the fence is completed the ground on each ſide the road is trenched about twenty inches deep, which may be done for about 3*l.* 10*s.* or 4*l.* *per* acre, according as the land is more or leſs gravelly. It is beſt done in the ſpring, when the planting ſeaſon is over. If, after the trenching, two or three chaldron of lime be laid on an acre, the land will produce an excellent crop either of cabbages or turnips, which being eaten off by ſheep in the autumn, will make the land in fine order for all ſorts of tree ſeeds: but as the oak is the ſort of tree cultivated in general, this is the method purſued in raiſing and managing that moſt valuable ſpecies. In the autumn, after the cabbages or turnips are eaten off, the ground requires nothing more than common digging. As ſoon as the acorns fall, after being provided with a good quantity, ſow them in the following manner: draw drills with a hoe in the ſame manner as is practiſed for peas, and ſow the acorns therein ſo thick as nearly to touch each other, and leave the ſpace of one foot between row and row, and between every fifth row the ſpace of two feet for the alleys. While the acorns are in the ground, great care muſt be taken to keep them from vermin, which would very often make great havock amongſt the beds, if not timely prevented. Let this caution ſerve for moſt other ſorts of tree ſeeds.

As ſoon as the acorns are come up, the beds require only to be kept clean from weeds till they want thinning; and as the plants frequently grow more in one wet ſeaſon, where the ſoil is tolerably good, than in two dry ones, where the ſoil is indifferent, the time for doing this is beſt aſcertained by obſerving when the tops of the rows meet, which is done when that is the caſe by taking away one row on each ſide the middlemoſt, which leaves the remaining three rows the ſame diſtance apart as the breadth of the alleys. In taking up theſe rows, the workman ought to be careful neither to injure the plants removed, nor thoſe left on each ſide. The reſt of the young oaks being now left in rows at two feet apart, let them again ſtand till their tops meet, then take up every other row, and leave the reſt in rows four feet aſunder, till they arrive to the height of about five feet; which is full as large a ſize as is ever wiſhed to be planted. In taking up the two laſt ſizes, the method is to dig a trench at the end of each row, full two feet deep, then undermine the plants, and let them fall into the trench with their roots entire; as very much of their future ſucceſs depends on this point of their being well taken up. And a ſimilar mode is neceſſary with other ſorts of trees in providing them for the purpoſe of planting.

But in the place of this method, the acorns as well as other ſeeds of trees are ſometimes ſown at firſt where they are to grow and remain. This method, the author of the Argyleſhire Report ſays, makes the beſt timber; the plants ſuffer no checks, nor feel the inconvenience of a change of ſoil,

ſoil, and the expence of raiſing an extenſive plantation in this manner is very trifling. Beſides, it is found that theſe ſeeds of trees will grow in ſituations in which the plants have failed. The moſt expeditious way of ſowing the ſeed in this manner, is, by a party of three men working together. The firſt with a paring ſpade takes up a turf, the ſecond ſtirs the earth with a ſpade, and the third diſtributes the ſeed and covers it. If any of the ſeedlings fail, they may be replaced by young plants raiſed on a ſimilar ſoil, which will ſoon be reconciled, when very young, to their change of ſituation. Indeed the oak, when planted from the ſeed, or at moſt from the ſeed-bed, adapts itſelf wonderfully to almoſt any ſoil or ſituation; though it delights moſt in that which is very dry and gravelly.

In many caſes, after the plants have been kept in the ſeminary or ſeed-bed for about two years, they are removed to a nurſery of this kind, and planted in rows or lines twelve or more inches apart according to their ſort, and from three to five in the rows, where they remain for two years longer, and are then finally planted out.

Preparation.—As ſoon as the plants have been raiſed in ſome of theſe methods, ſo as to be in a ſtate for planting out, the next point to be attended to, where the ground has been properly drained, is that of preparing it for their reception. In this buſineſs great care is neceſſary, as much depends upon its being in a good condition for the reception of the plants. It is performed by the plough or the ſpade according to the different circumſtances of the land. When coarſe plants prevail, ſuch as heath, furze, broom, &c. they muſt be fully deſtroyed by ſtubbing them up, burning, or otherwiſe clearing them away. When burning is practiſed, the aſhes ſhould be blended with the ſoil, as they are found of great ſervice in promoting the growth of the plants; in the opinion of Mr. Nicol. But the mode of preparing by the plough on tillable ſcites, where the ſoil is thin, is the cheapeſt and moſt effectual of any; as where the land has been in tillage, it wants nothing more than two furrows and an equal number of harrowings, to render it fit for the reception of the trees. But where it is in lay, a crop of oats, &c. ſhould be taken the ſeaſon before planting; or if it is ſtubborn, a ſecond crop, perhaps of beans, turnips or potatoes, will be neceſſary; previouſly ploughing and harrowing well, and laying the land up in a perfect method. A trench plough is frequently uſed for this purpoſe, which ſtirs the ground to twelve or thirteen inches. In this method it is eſſential to plough to the full depth each time, in order that the roots of the plants may ſtrike down more freely into the ſoil.

Where the ſpade is employed, which muſt be the caſe in deep ſituations where the plough cannot come, and where there are rock, ſtones, or other obſtructions; the beſt planters adviſe, that the holes or pits ſhould be made to the full depth of the ſoil, and ſufficiently large according to the ſize of the trees. For thoſe of eighteen or twenty inches in height, whoſe roots occupy about nine inches when ſpread out, holes of fifteen inches in diameter may be ſufficient. This muſt, however, be regulated by the judgment of the planter. And as it is of great advantage to the trees that the turfy matter ſhould be well broken down and reduced before the time of planting, it may be uſeful to have the holes made a proper length of time before the trees are put in, to admit of this being fully effected, eſpecially on the drier and more light ſoils, where there is a ſmaller proportion of this material.

Mr. Nicol ſtates, that from the deſire of early appearance it has been too much the caſe to plant foreſt-trees of too great growth. It is, however, found, that there is not only much ſaving of expence, but a much greater certainty of ſucceſs, in planting ſmall young trees than ſuch as are large and of greater age. Such as have been in the nurſery two, three, or four years according to their kind, may in common be the moſt advantageous as timber trees. He alſo thinks that deciduous trees of all kinds, except the larch, of from three to five feet in height, being carefully raiſed with good roots, will generally ſucceed. He has, however, ſhewn, that a one year's ſeedling larch, nurſed one or at moſt two years, will outdo all others of its kind in any ſoil or ſituation, and therefore adviſes planting trees of this age only. Firs of any kind will ſucceed better if under than above thirty inches, even in the moſt favourable ſoil and ſituation. Moſt generally thoſe of fifteen or eighteen inches in height are to be preferred. From this view of the ſubject, it may occur to ſome, that to plant ſeedlings only would be the moſt adviſeable and leaſt expenſive method. That it would be the leaſt expenſive method is obvious; but, that it is moſt adviſeable, except for the Scotch and ſpruce firs, may, he thinks, be diſputed.

As the chief property of any young tree intended for tranſplantation, conſiſts in a multiplicity of healthy fibres; hence the neceſſity of nurſing, in kindly ſoil, for a year or two, all tap-rooted plants, for the attainment of this object, and that we may commit them to the leſs genial ſoil and more untoward ſituation with greater probability of ſucceſs. For, whether ſhall we ſuppoſe the plant which has both root and branch to make, or that which has the latter only, in the firſt ſeaſon after ſo important a change of habit, is more likely to ſucceed?—the latter, certainly. From which alone may be demonſtrated the cauſe why plants of this deſcription ſurpaſs thoſe of greater ſize, as ſtated above. Theſe are raiſed with unbroken, tufty, and fibry roots; thoſe with maimed, lank, fibreleſs ones; nor do they, with the utmoſt ſkill and attention, bear ſuch proportion to the top. Conſequently the fibrils cannot afterwards, by the utmoſt efforts of human art, be induced ſo immediately to ſeek paſturage for the ſuſtenance of the trunk. For though lopping may in a great meaſure obviate this, injury is thereby done to the tree. In all ſoils and ſituations it is the ſafeſt and leaſt expenſive method to plant young healthy well rooted plants, where they can be procured.

Diſtances, Manner, and Time of Planting.—Mr. Nicol's directions are, that for the moſt expoſed, bleak ſcites, and barren ſoil, from thirty to forty inches may be conſidered as a good medium; varying according to circumſtances. For in an extenſive tract, it will hardly happen that there is not a variety of ſoils. Some parts may be deeper and more loamy; others more gravelly and rocky. In the former, the greater diſtance may be adviſeable; in the latter the leſſer. But for leſs expoſed ſcites, and where ſoil is found above ſix inches in depth, from four to five feet will be a good medium; varying the diſtances according to circumſtances as above. And for belts, ſtripes, or clumps, whoſe breadth or diameter does not exceed a hundred feet, lying in a bleak ſituation, and thin ſoil, the margin, on all ſides, ſhould be planted at not more than two feet apart: the interior at three. Thoſe lying on a more ſheltered ſituation, and of deeper ſoil, may be allowed diſtance according to circumſtances. But narrow ſtripes, or ſmall clumps, even if the ſoil may be termed good, ſhould generally be planted thicker than a more extended maſs, that the plants may afford each other ſhelter.

For the more ſheltered ſcites, where the ſoil is deep, good, and where apparently every plant will grow, ſix feet will be a good medium diſtance. Wider than this he cannot approve in any caſe whatever; becauſe at this diſtance, the

 plants

plants have room to grow till their thinnings become ufeful. But even where this is not an object, there is a greater; namely, that the plants may not grow too fquat in their infancy, and that the pruning hook be not much wanted in the formation of ftately timber. It is fuppofed that he who plants too thin, with the idea of faving trouble in thinning, deviates as widely from the right path, as he who thins none at all. It is, therefore, contended that thick, rather than thin planting, is the fafer fide to err on. By which mode alfo, there is a more equal crop on the ground, beeting or filling up vacancies being much lefs neceffary. And in oppofition to the common practice, it is fuppofed that thick planting is moft neceffary where the plants are largeft, as the greateft number die in thefe cafes. The Nottinghamfhire Report ftates, that in the duke of Portland's plantations, where trees of various fizes are planted in an irregular manner, the number upon an acre is ufually about two thoufand; but in other cafes the number is frequently much larger.

With refpect to the manner of fetting the trees in the plantations, it is probably the beft method, except where vegetable crops are to be cultivated between, to plant without any regular order, though the line or row manner is frequently practifed, as being the leaft troublefome and expenfive of any that can be adopted. With refpect to the moft advantageous manner of blending or intermixing the trees, it is obferved that fome have advifed the planting in groups, to prevent the fuppofed injury of trees of different forts growing together; others, however, prefer the mixed method, not only as affording a better means of afcertaining what forts of timber trees fucceed beft, but as enabling the planter to protect them more effectually. It has, however, been fuggefted by Mr. Nicol, that it matters little whether we plant in diftinct groups or in indifcriminate mixture; provided, in the latter cafe, we ultimately retain the moft profitable and flourifhing kinds only: for, with the provifo that moft of the kinds evidently adapted to the foil and fituation be planted according to the mode of thick planting, a fufficiency of them will remain, after all others are thinned away, for a full and final crop. For inftance: if it fhould be fuppofed that the foil is beft adapted to the oak; that it is defirable to raife the moft valuable kinds rather than the decorative; and that, exclufive of the larch for nurfes, and a few firs to enliven the borders, fix kinds are to compofe the mixture; plant two oaks for one elm, two elms for one beech, two beeches for one afh, two afhes for one birch, and two birches for one fycamore. And thus will the plantation at once be formed, in uniform gradation, of kinds moft likely to fucceed each other, in the cafe of either difagreeing with the foil or climate; and which alfo fucceed each other in refpect of value as timber: doing juftice, at leaft, to the patriotic intention of the planter, fhould the firft and more valuable kinds fail.

It is conceived that in all fituations, and on all foils, except thofe termed humid, and which are adapted to the aquatic kinds only, the larch is, without doubt, the moft proper nurfe, and therefore fhould take preference of all others for this purpofe. But on fub-humid, or loamy foils, the Lombardy poplar and Huntingdon willow are good fubftitutes; and, when variety is the object, ought to be mixed with the larch, for the purpofe of nurfing the other more valuable kinds. And that on elevated, poor fcites, the mountain-afh, for the firft ten or fifteen years, is outdone by the larch only in the office of nurfing, and is juftly admitted for the fake of variety. In all fituations, this plant grows quickly in youth. In maritime fituations, the fycamore is likewife evidently ufeful for this purpofe. Few trees, except the above, grow fafter in youth; and none are more patient of the fea-breeze. Confequently, when the fcite is much expofed thereto, this tree fhould be freely planted in mixture with the larch for nurfing the oak, beech, elm, &c. if the intention be the culture of fhip-timber. It is likewife fuggefted, that the common pine may fometimes be ufeful in this view, and afford greater variety. The proportion in which trees of this fort fhould be employed, muft neceffarily depend on the peculiarity of the fituation, and other circumftances. Some recommend in thin foils, and bleak fituations, tree for tree; and in lefs expofed fituations, and better foils, one nurfe for two principal trees; and in moft fheltered fituations, with good foil, one nurfe for three, four or five principal trees may be a fufficient allowance. On the moft expofed and bleak fituations, where the foil is evidently fterile, the fafeft way is to plant too many rather than too few, as, unlefs well fheltered, the timber trees never fucceed well in expofed fituations.

The time of planting thefe forts of trees with the moft advantage, and the greateft chance of fuccefs, differs according to the nature of the foils and the plants, as well as in the ftate of the weather. It has been ftated, that in the more porous dry foils, with the hardier forts of trees, the autumn, as from the middle of October to the latter end of November, may be the moft fuitable; as they will be better eftablifhed againft the fummer heats, which are often deftructive to new planted trees. But in the more heavy foils, efpecially thofe of the clayey and loamy kinds, and with lefs hardy forts of trees, the early fpring feafon, as from the middle or latter end of February to the beginning of April, may be the moft proper. The condition of the land fhould be particularly attended to in this fort of work, as it is equally improper to plant when either in too dry or too moift a fituation. At a time when the foil is neither wet nor dry, the operation of planting is moft eafily, and alfo moft fuccefsfully performed. The mould adheres not to the fpade, nor does it run in; it divides well, and with little trouble intermingles with the fibres; nor, in the operation of treading and fetting the plant upright, is it wrought into a mortar, to the evident prejudice of the plant, whatever weather may enfue. Confequently, on a retentive foil, it cannot be proper to plant in time of rain, nor in many cafes for a day or two afterwards; nor after a fall of fnow, until for feveral days it has entirely difappeared. Whereas on a dry abforbent foil, it may be very proper to plant in time of gentle rains or immediately after heavy ones.

Another circumftance which ought to be regarded in this bufinefs, is the difference in the forwardnefs of the vegetation of different forts of trees, as it fhould regulate in fome degree the time of planting, where thofe of the fame forts are only made ufe of. In this view, it is advifed that the larch, elm, fycamore, lime, horfe-chefnut, mountain-afh, birch, alder, poplar, willow, and fome others, fhould be put in by the beginning of March; and that the oak, birch, afh, chefnut, hornbeam, &c. be finifhed planting by the beginning of April at the lateft. The beft feafon for planting of many trees of the evergreen kind, fuch as the Weymouth pine, fpruce, Scotch, filver, and other firs, is fuppofed by fome to be in the latter end of July, or in the beginning of the following month, when the weather is inclined to be moift or cloudy.

Planting out.—It is advifed, that as foon as the trees have been taken up with care, fo as to injure the fibres of the roots as little as poffible, and a few of the bruifed extremities cut off, they fhould, when intended to be planted in mixture, be put together in proper proportions, and conveyed in this way

way to the place where they are to be planted. They muſt then be diſtributed on the ground, at the pits or other places, in order to be ready for the planters, as by this means much time is ſaved, which would otherwiſe be loſt in ſorting. But to prevent the roots from getting too dry, it is neceſſary not to take up or bring on to the land more than can be planted in a ſhort ſpace of time. But where only one or two ſorts of trees are to be planted, the uſual practice of carrying the plants along as the planting proceeds, may be the moſt convenient method for performing the work. And the operation is the beſt and moſt readily performed by two perſons: a man to do the work, and a boy to hold the plants. In executing the work, the labourer firſt ſtirs the mould well in the holes or pits that have been previouſly prepared, rendering it level, and fit for the reception of the plant: or forms new holes according to the mode of planting that is adopted. The boy then places the plant in the hole, with all the fibres of its roots regularly ſpread out and unconfined, to the depth of about an inch more than it had ſtood in the nurſery, holding it perfectly upright; while the man gently fills in the looſe mould, moving the tree a little up and down to let it mix with the roots: the remainder of the earth is afterwards put in; and the labourer proceeds to the preparation of the next hole, leaving the boy to ſet the plant erect and cloſe the mould about it, which in ſoils of the ſtiffer ſorts ſhould be only performed in a light manner, but in thoſe of the drier kinds, as the ſandy and gravelly, as cloſely as poſſible. In this way the work is to proceed till the whole is finiſhed. There are other methods of planting ſometimes made uſe of, ſuch as by forming ſlits, nicks, or openings of other kinds, ſo as juſt to preſs in the roots of the plants; but theſe, from the roots being confined, and having no looſe freſh mould to ſhoot into, ſeldom anſwer in any perfect manner. It is well remarked that much of the ſucceſs of the planter depends upon this part of the work being well executed; but that great care ſhould be taken, particularly where the land is inclined to moiſture, or of a retentive quality, not to plant at too great a depth. In planting on ſteeps, it is directed that the trees ſhould be placed towards the declivity, being put in at the loweſt part of the opening; which ſhould, in completing the work, be left the higheſt, by which the moiſture may be better preſerved for the ſupport of the plant.

It ſeems not improbable, the author of Practical Agriculture ſays, but that in many caſes and ſituations, the planting of ſmall trees of the timber kind might be performed with great convenience and expedition by the aſſiſtance of a plough ſuitable for the purpoſe, as has been ſometimes practiſed in ſetting hedge-plants. Where trees of conſiderable growth are planted, great attention is neceſſary to have them well ſecured againſt the wind, as, when they become looſe, the fibres are ſo broken and deſtroyed that they ſoon die. This has been commonly effected by means of ſtaking: but as in this way the trees are often in danger of being injured by rubbing, a practice of ramming the earth cloſely about the roots has been attempted, which in ſome ſoils, and upon ſmall ſcales of planting, has, it is ſaid, been found to ſucceed; but in extenſive concerns it is wholly inadmiſſible, from the trouble that muſt attend it.

When the plants have been all put in, it is a practice in ſome caſes to ſow or ſet the plantations with acorns, as it is found that ſown oaks as well as other trees exceed in growth thoſe that are planted. This work is done either by paring off the ſurface with a mattock, and ſetting the acorns with a dibble, or by putting them in ſlight drills by the hoe, at the diſtance of about ſix inches. The beſt ſeaſon for performing this buſineſs is in April, and it may be performed the firſt, ſecond, or third year after planting the ground, but the firſt or ſecond is probably to be preferred. It is adviſed that great care ſhould be taken to preſerve the acorns well, by expoſure to the air and frequent turning, as they are very apt to ſprout ſoon after being gathered. The proportions of theſe and other ſorts of ſeeds that are neceſſary are thus ſtated in the Nottingham Agricultural Report.

Quantities *per* Acre.

Of acorns from four to ſix ſtrikes.
— aſh keys, four ſtrikes.
— Spaniſh cheſnuts, one ditto.
— hawthorn berries, one ditto.

It is neceſſary to bury the aſh keys and hawthorn berries one year in beds or pots of ſand before they are ſown in theſe ſituations.

When the trees have been thus planted out, it is adviſed as neceſſary not to loſe ſight of them, as the young plants ſhould be kept clean and free from the annoyance and choaking of coarſe weeds of all kinds, for at leaſt three or four years. This may be done by the hoe in many caſes; but ſome have recourſe to the culture of different ſorts of crops in this view. In this method, however, much care is requiſite not only to avoid injuring the plants, but to guard againſt the ſoil being too much impoveriſhed, and their growth thereby retarded in too great a degree. And where coarſe plants abound, ſuch as broom, furze, briars, and other ſimilar productions, in all the leſs expoſed ſituations, they ſhould be wholly cut up and deſtroyed; but in bleak expoſures it may be a better practice to only clear them to a diſtance round the trees, ſo that they cannot do any injury by rubbing or ſtriking againſt them, the others being left for the purpoſe of ſheltering and protecting the young trees during their young growth. There is another circumſtance likewiſe to be attended to in this buſineſs, which is that of filling up the vacancies that are cauſed by the dead plants. Where the ground is kept perfectly clean, this may be done at any proper ſeaſon; but in other caſes, when the dead plants cannot be ſo eaſily detected, it may be better to delay the buſineſs to the third or fourth year, when the deficiencies can be more perfectly aſcertained. If this ſort of buſineſs be done too early, many plants are frequently removed that would have thrown out from the bottom, on account of their not being dead in that part, though wholly gone in the top. It is adviſed that the plants employed in filling up theſe vacancies ſhould never be too large, as where that is the caſe they are liable to die or be deſtroyed.

There is ſtill another kind of planting which is frequently practiſed, but the propriety of which is not yet well aſcertained. It is that of ſetting hedge-rows with trees of the timber kinds. The utility of the practice is maintained by ſome on the ground of the degree of ſhelter and ornament that it affords, and its being a means of raiſing much uſeful timber at little or no expence; while others condemn it as highly improper, and diſadvantageous, on the principle that much injury is not only done to the crops, eſpecially when of the grain kind, by the dropping and the ſpreading of the roots, but alſo to the hedge in the places where they ſtand, by their producing gaps and openings. The author of a late practical work, however, ſuggeſts, that though ſome inconvenience and injury may be ſuſtained where this ſort of planting is much in uſe in arable diſtricts; yet from theſe being, in a great meaſure, capable of being obviated by proper training and pruning, and from the naked appearance which is exhibited without them in a country, but more particularly from the vaſt benefit that may be derived

derived in the way of timber; it would ſeem that ſome extent of planting in this method ſhould be attempted in moſt ſituations. Mr. Middleton hints, that it would not be an eaſy matter to make an accurate eſtimate of the advantages to be derived from ſuch a meaſure: but in order to gain a ſlight idea as to the quantity of hedge-row timber, let it be conſidered that, in well-incloſed, hedged, and cultivated diſtricts, the hedge-rows occupy from a twentieth to a tenth of the whole ſurface. Even including the common fields, and cultivated ſlopes and borders of ſheep-downs, the average quantity of land occupied by hedge-rows, at this time, amounts to a twentieth, or two millions of acres; all of which might probably be made to produce timber: more than half of it, however, would no doubt do ſo, by only trimming the loweſt ſide branches off to the height of ten, twelve, or fifteen feet from the ground. This would permit the air to circulate freely, give every advantage to the occupier's crops; and would leave ſufficient tops upon the trees for the purpoſes of growth and rural ornament. Under management like this, the hedges would every where preſent healthy, vigorouſly-growing, and handſome timber; and would add very much to the profit of the land owner, to the ſecurity of the country, and to the pleaſures of the traveller. But in performing the work of planting in ſuch caſes, the nature of the land, the ſort of huſbandry that it is principally conducted under, and the kind of expoſure in which it is placed, ſhould be well conſidered, and the ſort of trees properly adapted to it. In dry ſoils, moſt ſorts of timber trees, as has been ſeen, may be planted; but in thoſe more ſtiff and heavy kinds, the oak and the elm may be the moſt proper. The aſh ſhould, perhaps, never be had recourſe to where the land is almoſt wholly under the plough; but on lands under the grazing or graſs ſyſtem, it may be planted with advantage. In bleak and expoſed ſituations, the beech is probably the beſt for this uſe; and near the ſea the ſycamore. The trees where the ground is moſtly in an arable ſtate ſhould be planted at much greater diſtances than under the contrary circumſtances, and ſuch trees as run moſt to tall clear ſtems be preferred. It is recommended that the young trees in this ſort of planting ſhould be larger than in other caſes, being kept in the nurſery two years longer than has been here adviſed, and ſhifted ſo as to produce more fibrous roots. When about five or ſix feet in height they are probably in the moſt ſuitable condition for being planted out in theſe places.

In theſe caſes the moſt proper time of planting in hedge-rows is, when the fields are firſt broken up from the ſtate of lay, as at that time, from their being continued in the ſtate of tillage for ſome years, there will be leſs trouble and expence in protecting them from cattle by palings, &c. as well as leſs danger of their being injured by the browſing of live ſtock, as they will be advanced beyond their reach by the time the land is reſtored to graſs.

Where the planting is performed in the hedge-rows of graſs lands, the trees muſt always be perfectly ſecured from the croppings of cattle, as well as the rubbing of ſheep, or other animals, as where this is not the caſe, they are ſoon much injured, and frequently wholly deſtroyed. The work of planting in theſe caſes ſhould be carefully performed in the manner deſcribed; and where the trees do not ſtand perfectly firm againſt the wind, be well ſecured by ſtakes, or other proper means, as they never thrive well when not kept perfectly faſt and ſteady in the ſoil.

The practice frequently employed of converting the hedge-row timber trees into pollards by lopping off their top branches, ſhould conſtantly be guarded againſt as much as poſſible, as it is the deſtruction of timber. Where pollards abound, they are moſtly cropped once in from about nine to fifteen years, the profits of which, in general, belong to the tenant. This work ſhould be conſtantly finiſhed by the end of February, where it is in uſe, at the lateſt.

As ſoon as the trees have acquired a tolerable growth, it is neceſſary, in all caſes, to attend to the proper pruning and thinning of them occaſionally as they advance, in order to prevent their growing in an improper manner, and their injuring each other by rubbing or being drawn up weak. In the firſt intention, they are therefore to be occaſionally looked over after the third ſeaſon from planting, and ſuch headed down, or otherwiſe cut, as may appear neceſſary for their more regular or perfect growth. When this has been done, the only thing further will be to encourage a leader, by ſhortening all the other branches that appear to contend with it to nearly one-third of their length, in order to ſtrengthen their main ſtem. The whole that is afterwards neceſſary, is that of properly thinning the ſtrong top branches, and thoſe on the ſides, which may be done by a light bill. This is, however, only applicable to trees of the foreſt kind; thoſe of the fir and evergreen ſort require nothing more than the regulation of their leaders, as that of keeping them ſingle where they throw out double. The leſs the ſide branches are touched the better in all theſe ſorts of trees, as they are very much hurt by cutting.

On the whole, planting is without doubt the moſt productive improvement that can be attempted on poor barren lands, and ought to be promoted in every way as much as poſſible; but more eſpecially by the application of ſome ſort of ſtimulus which could have the effect of inducing the proprietors of lands, in ſituations proper for it, not to neglect ſuch undertakings, as being the beſt means of rendering their properties fully and completely valuable, as well as of benefiting the country.

Planting, *Inverſe* or *Reverſe*, is a method of planting, in which the ordinary poſition of the plant, or ſhoot, is inverted; the branches being ſet in the earth, and the roots reared into the air.

Agricola mentions this monſtrous way of planting, which, he aſſures us, ſucceeds very well in moſt, or all ſorts of fruit-trees, timber-trees, &c. both foreign and domeſtic. Bradley affirms his having ſeen a lime-tree in Holland, growing with its firſt roots in the air, which had ſhot out branches in great plenty, at the ſame time that its firſt branches were turned into roots, and fed the tree.

The induſtrious Mr. Fairchild has practiſed the ſame with us, and gives us the following directions for the performance of it.

Chooſe a young tree of one ſhoot, of alder, elm, willow, or any other tree that takes root readily by laying; bend the ſhoot gently down, till the extreme part be in the earth, and ſo let it remain till it has taken good root. This done, dig about the firſt root, and gently take it up out of the ground, and raiſe it till the ſtem be nearly upright; in which ſtate ſtake it up.

Then prune the roots, now erected in the air, from the bruiſes and wounds they received in being dug up; and anoint the pruned parts with a compoſition of four parts of bees'-wax, four of tallow, two of reſin, and two of turpentine, melted together, and applied pretty warm. Then prune off all the buds or ſhoots upon the ſtem, and dreſs the wounds with the ſame compoſition, to prevent any collateral ſhootings; and leave the reſt to nature.

Planting, in *Architecture*, denotes the laying the firſt courſes

courses of stone on the foundation, according to the measures, with all the exactness possible.

PLANTS, in *Botany* and *Vegetable Physiology*, compose the second of the three kingdoms of nature. To define the limits of these, the animal, the vegetable, and the fossil kingdoms, has exercised the ingenuity of philosophers. When fossils were believed to possess a vegetative power, which even Tournefort maintained, the chief difficulty lay in distinguishing them from plants; but since the mineral kingdom has been ascertained to depend on the laws of chemistry alone, all ambiguity on that side of the question is removed. On the other hand, in proportion as the physiology of plants has been studied, their anatomy, nutrition, developement, and propagation, have been found so nearly allied to similar functions in animal bodies, that increase of knowledge has but augmented our perplexity. The following are among the most approved definitions, intended to discriminate between animals, vegetables, and fossils.

Jungius, in his Isagoge, p. 1, says "a plant is a living body destitute of sensation; or it is a body attached to some certain place or seat, whence it derives powers of nourishment, increase, and propagation." Linnæus cites this passage inaccurately in Phil. Bot. 1. He observes, in a manuscript note, that the floating sea-weeds, and *Confervæ*, form an exception.

Boerhaave considers a plant as "an organic body, attached by some part of itself to some other body, whence it derives nourishment."

Ludwig asserts that "natural bodies constantly endowed with the same form, and with locomotion, are animals; those which have the same form, without locomotion, are vegetables; and those which have a diversity of form, are minerals." To this Linnæus well objects, the perfect regularity of form in crystals of the same species; and the want of locomotion in several animals.

Tournefort, in his Isagoge, 54, says "a plant is an organic body, always furnished with roots, perhaps always with seeds, and almost always with leaves, flowers, and stems."

Alston has defined vegetables as nourished by pores situated in their external surface, animals by vessels in their internal one.

Linnæus, in Phil. Bot. 1, has given the most neat, and generally approved, definition. "Stones grow. Vegetables grow and live. Animals grow, live, and feel."—To which he has subjoined, in manuscript, "*et se movent, motu possibili;*" *i. e.* and are endowed with a certain degree of spontaneous motion.

Difficulties attend all these positions. The want of sensation in vegetables cannot be demonstrated, nor are appearances to the contrary wanting; so that it can never serve for a practical mode of discrimination, nor as a basis for any philosophical argument.

Mirbel, in his Traité d'Anatomie et de Physiologie Végétales, has remarked "that plants alone have a power of deriving nourishment, though not indeed exclusively, from inorganic matter, mere earths, salts or airs, substances certainly incapable of serving as food for any animals, the latter only feeding on what is or has been organized matter, either of a vegetable or animal nature. So that it should seem to be the office of vegetable life alone to transform dead matter into organized living bodies."

To this we can find no exception. However inconvenient, and indeed impossible to be used, as a practical test, it appears to be a sound philosophical distinction, between the animal and vegetable kingdoms. The fossil or mineral kingdom is essentially distinguished from both, by the want of an organized structure, developed and increased by absorption; and of a vital principle, essential to the performance of all the functions on which their health, growth and propagation depend.

Plants come under consideration, in various points of view, in a work like the present. For what concerns their anatomy and physiology, see ANATOMY, BARK, CORTEX, CIRCULATION *of Sap*, FECUNDATION *of Plants*, LEAF, FLOWER, GERMEN, PERICARP, &c.: for their scientific arrangement and discrimination, see BOTANY, CLASSIFICATION, FLORA, FIGURES *of Plants*, GENUS, SPECIES, NATURAL *Orders*, SYSTEM, &c. See also LICHENES and MUSCI. The reader is requested to correct two typographical errors in the latter article, column eighth, line 18 from the top, for *sinks* read *shrinks;* and line eight from the bottom, for *sexual* read *esexual.*

PLANTS *of Britain*, the natural spontaneous production of our soil and climate, have formed the subject of many separate botanical works. More or less perfect catalogues of British plants have been published by How, Ray, Petiver, Wilson, Hill, Jenkinson, and others, besides a number of local Floras. Ray's *Synopsis Methodica Stirpium Britannicarum* first set the example of a systematic arrangement, and scientific discrimination, of our native vegetable productions, and has been the foundation of all that has been done since. This excellent work was accommodated to the Linnæan system and principles, with augmentations, by Hudson, and has led the way to the labours of Withering, Lightfoot, Robson, Broughton, Wade, Hull, Curtis, Relhan, Abbott, and the writer of the present article, whose *Flora Britannica*, extended as yet no farther than the end of the *Musci*, was written on a comparison of all that had before been done, with the specimens of the Linnæan herbarium. This Latin work has been followed up and illustrated by the figures, and English descriptions, of the same author's *English Botany*, drawn, engraved, and published by Mr. Sowerby, which is just now come to a conclusion, in thirty-six volumes octavo, with 2592 coloured plates. In the progress of this latter work, since the *Flora Britannica*, or the *Compendium Fl. Britannicæ*, appeared, about 150 species have been added to the British list; even in the first twenty-three, or phænogamic, classes of the Linnæan system. We propose, therefore, in the present article, to exhibit a complete catalogue of the Phænogamic plants of Britain, as far as the present state of our knowledge extends, with a reference throughout to the *English Botany*, in which, with two or three exceptions only, they are now all separately delineated. These amount to 1450. So full an enumeration of British plants has no where, hitherto, appeared; and we shall take the opportunity of correcting mistakes of the *Flora Britannica*, respecting certain species erroneously there admitted. This catalogue is arranged according to the Linnæan system, with those slight alerations only, which are adopted in the *Fl. Brit.* and accounted for in the author's *Introduction to Botany.* Each plant is mentioned by its generic and specific names, in Latin and English; then follows a reference to the volume and plate of Engl. Bot.—The particular situation, duration, and flowering month, of every species are subjoined. Whatever the reader may wish further to know, is to be sought under the name of each genus, at its proper place in the alphabet. New species, not there mentioned, are particularly described or defined, and various necessary corrections are given respecting preceding articles, as in the classes *Tetradynamia* and *Gynandria.* New matter, regarding genera belonging to the poſterior part of the alphabet, will hereafter be found there. An aſteriſk (*) is prefixed to every ſpecies, preſumed to be of foreign origin, or but imperfectly naturalized here; and a croſs (†) to thoſe concerning which ſome error is ſuſpected, they being, not at preſent, found in the places indicated, and perhaps having had other ſpecies originally miſtaken for them. The Latin names throughout correſpond with the *Flora Britannica* and *Engliſh Botany*, except where the contrary is expreſſed by a ſynonym between crotchets.

The 24th claſs, *Cryptogamia*, though not omitted, is neceſſarily treated in the moſt compendious manner, it being impracticable at preſent correctly to enumerate the Britiſh ſpecies of that claſs. Even a partial catalogue of them would alſo have extended this article too far. They are nearly all, except *Fungi*, included in the *Engliſh Botany*.

Claſs 1. Monandria.

Ord. 1. *Monogynia.*

Salicornia. Glaſſwort.

1. S. *herbacea*, common, or ſamphire. vol. 6. pl. 415. Sandy ſea ſhore. Annual. 8th and 9th months.
2. S. *procumbens*, procumbent. 35. 2475. Sea ſhore. Ann. 8.
3. S. *radicans*, creeping. 24. 1691. Muddy ſhores. Perennial. 9.
4. S. *fruticoſa*, ſhrubby. 35. 2467. Sea-coaſt, rare. Per. 8, 9.

Hippuris. Mare's-tail.

1. H. *vulgaris*, common. 11. 763. Pools and ditches. Per. 5.

Chara. Chara.

1. C. *vulgaris*, common. 5. 336. Muddy waters. Ann. 7.
2. C. *hiſpida*, prickly. 7. 463. Pools and ditches. Ann. 7, 8.
3. C. *flexilis*, ſmooth. 15. 1070. Pools and lakes. Ann. 7, 8.
4. C. *tranſlucens*, great tranſparent. 26. 1855. Pools, rare. Ann. 6, 7.

This is the larger plant of Vaillant, fig. 8, mentioned as a variety of *flexilis* in our article Chara, n. 4.

5. C. *nidifica*, proliferous. 24. 1703. Sea ditches. Ann. 7, 8.

"Smooth, tranſparent, without prickles. Leaves cylindrical, elongated, all ſimple. Anther often ſtalked."

More ſlender and branched than the laſt, but more ſtout and firm in habit than *C. flexilis*.

6. C. *gracilis*, ſlender. 30. 2140. Pools, rare. Ann. 9.

"Smooth, tranſparent, ſhining, without prickles. Lateral branches repeatedly forked; their ſegments awl-ſhaped, acute. Leaves awl-ſhaped, often branched."

Much ſmaller and more tufted than the laſt. When dry almoſt colourleſs, ſhining like glaſs.

Zostera. Graſs-wrack.

1. Z. *marina*, ſea. 7. 467. Sea ditches. Per. 8, 9.

Ord. 2. *Digynia.*

Callitriche. Water Star-leaf.

1. C. *aquatica*, common. 11. 722. Ditches and pools. Ann. 4—10.

Claſs 2. Diandria.

Ord. 1. *Monogynia.*

Ligustrum. Privet.

1. L. *vulgare*, common. 11. 764. Woods and hedges. Shrubby. 5, 6.

Fraxinus. Aſh.

1. F. *excelſior*, common. 24. 1692. Woods and hedges. Tree. 4, 5.
2. F. *heterophylla*, ſimple-leaved. 35. 2476. Woods, rare. Tree. 4, 5.

See Fraxinus, n. 8. var. b.—Vahl's name, *heterophylla*, is preferable to *ſimplicifolia*, as a few leaves are often ternate, or even pinnate, on the ſame tree with the ſimple ones.

Circæa. Enchanter's Nightſhade.

1. C. *lutetiana*, common. 15. 1056. Shady dank places. Per. 6, 7.
2. C. *alpina*, mountain. 15. 1057. Rocks and woods. Per. 7, 8.

Veronica. Speedwell.

1. V. *ſpicata*, ſpiked. 1. 2. Chalky paſtures. Per. 7—9.
2. V. *hybrida*, Welch. 10. 673. Mountains, rare. Per. 7.
3. V. *officinalis*, male, or common. 11. 765. Barren heaths. Per. 5, 6.
4. V. *ſaxatilis*, blue rock. 15. 1027. Highlands. Per. 7.
5. V. *fruticuloſa*, fleſh-coloured ſhrubby. 15. 1028. Highl. Per. 7.
6. V. *alpina*, alpine. 7. 484. Highland rills. Per. 7, 8.
7. V. *ſerpyllifolia*, ſmooth. 15. 1075. Meadows and paſtures. Per. 5, 6.
8. V. *Beccabunga*, brooklime. 10. 655. Rivulets. Per. 7.
9. V. *Anagallis*, water. 11. 781. Rivers and ditches. Per. 7.
10. V. *ſcutellata*, narrow marſh. 11. 782. Sandy ditches. Per. 7, 8.
11. V. *montana*, mountain. 11. 766. Chalky woods. Per. 5, 6.
12. V. *Chamædrys*, germander. 9. 623. Groves and hedges. Per. 5.
13. V. *agreſtis*, procumbent. 11. 783. Fields and gardens. Ann. 4—9.
14. V. *arvenſis*, wall. 11. 734. Dry ground. Ann. 5.
15. V. *hederifolia*, ivy-leaved. 11. 784. Fields, &c. Ann. 4, 5.
16. V. *triphyllos*, fingered. 1. 26. Sandy fields, rare. Ann. 4.
17. V. *verna*, vernal. 1. 25. Barren fields. Ann. 4.

Pinguicula. Butterwort.

1. P. *luſitanica*, pale. 3. 145. Bogs, rare. Per. 6, 7.
2. P. *vulgaris*, common. 1. 70. Bogs. Per. 5, 6.
3. P. *grandiflora*, large-flowered. 31. 2184. Bogs, Ireland. Per. 5, 6.

Utricularia. Bladder-wort.

1. U. *vulgaris*, common. 4. 253. Ditches and pools. Per. 7.
2. U. *intermedia*, intermediate. 35. 2489. Lakes, Irel. Per. 7.
3. U. *minor*, leſſer. 4. 254. Bogs and ditches. Per. 7.

Lemna. Duck-weed.

1. L. *triſulca*, ivy-leaved. 13. 926. Pools and ditches. Ann. 6.

2. L.

2. L. *minor*, leſſer. 16. 1095. Pools, common. Ann. 6, 7.
3. L. *gibba*, gibbous. 18. 1233. Pools. Ann. 6, 7.
4. L. *polyrrhiza*, greater. 35. 2458. Ditches. Ann. 7, 8? Flowers of this ſpecies only have never been obſerved.

LYCOPUS. Water-horehound.

1. L. *europæus*, common. 16. 1105. Ditches. Per. 7, 8.

SALVIA. Clary.

1. S. *pratenſis*, meadow. 3. 153. Dry meadows, rare. Per. 7.
2. S. *verbenaca*, common Engliſh. 3. 154. Paſtures. Per. 6—10.

Ord. 2. *Digynia.*

ANTHOXANTHUM. Vernal-graſs.

1. A. *odoratum*, ſweet-ſcented. 9. 647. Paſtures. Per. 5.

Claſs 3. TRIANDRIA.

Ord. 1. *Monogynia.*

VALERIANA. Valerian.

1. V. *rubra*, red. 22. 1531. Walls, and chalk cliffs. Per. 6—9.
2. V. *dioica*, ſmall marſh. 9. 628. Marſhes. Per. 6.
3. V. *officinalis*, great wild. 10. 698. Marſhes and hills. Per. 6.
4. V. *pyrenaica*, heart-leaved. 23. 1591. Woods, Scotland. Per. 6.
5. V. *Locuſta*, corn-ſallad. 12. 811. Fields, common. Ann. 4.
6. V. *dentata*, oval-fruited. 20. 1370. Fields, rare. Ann. 6, 7.

CROCUS. Saffron.

*1. C. *ſativus*, cultivated. 5. 343. Fields. Per. 9.
2. C. *vernus*, ſpring. 5. 344. Meadows and paſtures. Per. 3.
3. C. *nudiflorus*, naked-flowering. 7. 491. Sandy low meadows. Per. 10.

IXIA. Ixia.

1. I. *Bulbocodium*, Dwarf. 36. 2549. Hillocks, Jerſey. Per. 4.

IRIS. Iris.

1. I. *Pſeud-acorus*, yellow. 9. 578. Waters. Per. 7.
2. I. *fœtidiſſima*, ſtinking. 9. 596. Groves. Per. 6.

SCHOENUS. Bog-ruſh.

1. S. *Mariſcus*, prickly. 14. 950. Bogs and marſhes. Per. 7, 8.
2. S. *nigricans*, black. 16. 1121. Spongy turfy bogs. Per. 6.
3. S. *compreſſus*, compreſſed. 11. 791. Spongy meadows. Per. 7.
4. S. *rufus*, red-brown. 15. 1010. Marſhes. Per. 7.
5. S. *albus*, white-headed. 14. 985. Spongy bogs. Per. 8.

Stamens but two. Seeds with many briſtles at the baſe.

6. S. *fuſcus*, brown-headed. 22. 1575. Bogs, South Wales. Per. 8.

Stamens three. Seeds with only three briſtles at the baſe.

CYPERUS. Engliſh Galangale.

1. C. *longus*, ſweet-ſcented. 19. 1309. Marſhes, rare. Per. 7.

SCIRPUS. Club-ruſh.

1. S. *paluſtris*, marſh creeping. 2. 131. Bogs and ditches. Per. 6, 7.
2. S. *multicaulis*, many-ſtalked. 17. 1187. Turfy bogs. Per. 7.
3. S. *cæſpitoſus*, ſcaly-ſtalked. 15. 1029. Turfy heaths. Per. 7.
4. S. *pauciflorus*, chocolate-headed. 16. 1122. Mountain bogs. Per. 8.
5. S. *acicularis*, leaſt. 11. 749. Moiſt heaths. Per. 8.
6. S. *fluitans*, floating. 3. 216. Ditches and pools. Per. 7, 8.
7. S. *lacuſtris*, bull-ruſh. 10. 666. Clear waters. Per. 7.
8. S. *glaucus*, glaucous. 33. 2321. Salt marſhes. Per. 7, 8.
9. S. *Holoſchoenus*, round cluſter-headed. 23. 1612. Sea-ſhore. Per. 8—11.
10. S. *ſetaceus*, briſtle-ſtalked. 24. 1693. Sandy wet places. Ann. 7, 8.
11. S. *triqueter*, triangular. 24. 1694. Marſhes and rivers. Per. 8.
12. S. *carinatus*, blunt-edged. 28. 1983. Rivers. Per. 8.
13. S. *maritimus*, ſalt-marſh. 8. 542. Salt marſhes. Per. 7, 8.
14. S. *ſylvaticus*, wood, or millet. 13. 919. Moiſt woods. Per. 7.

ERIOPHORUM. Cotton-graſs.

1. E. *vaginatum*, hare's-tail. 13. 873. Highland moors. Per. 3, 4.
2. E. *capitatum*, round-headed. 34. 2387. Highland mountains. Per. 8.
3. E. *polyſtachion*, broad-leaved. 8. 563. Bogs. Per. 4.
4. E. *anguſtifolium*, narrow-leaved. 8. 564. Bogs. Per. 4.
5. E. *gracile*, ſlender mountain. 34. 2402. Highland mountains. Per. 7.
6. E. *alpinum*, alpine. 5. 311. Highland bogs. Per. 4, 5.

NARDUS. Mat-graſs.

1. N. *ſtricta*, common. 5. 290. Sandy moiſt heaths. Per. 7.

Ord. 2. *Digynia.*

PHALARIS. Canary-graſs.

*1. P. *canarienſis*, manured. 19. 1310. Waſte ground. Ann. 6—8.
2. P. *arundinacea*, reed. 6. 402. 30. 2160. f. 2. Ditches, &c. Per. 7.

PANICUM. Panick-graſs.

1. P. *verticillatum*, rough. 13. 874. Moiſt fields. Ann. 6, 7.
2. P. *viride*, green. 13. 875. Sandy fields. Ann. 7.
3. P. *Crus-galli*, looſe. 13. 876. Moiſt fields. Ann. 7.
4. P. *ſanguinale*, cock's-foot. 12. 849. Fields, rare. Ann. 7.
5. P. *dactylon*, creeping. 12. 850. Sandy ſea-ſhore. Per. 7, 8.

PHLEUM. Cat's-tail-graſs.

1. P. *pratenſe*, common. 15. 1076. Paſtures. Per. 6—10.

2. P.

2. P. *alpinum*, alpine. 8. 519. Highlands. Per. 7.
3. P. *paniculatum*, panicled. 15. 1077. Fields, rare. Ann. 7.
4. P. *Boehmeri*, canary. 7. 459. Sand or chalk. Per. 7.
5. P. *Michelii*, Michelian. 32. 2265. Highland rocks. Per. 7.
6 P. *arenarium*, fea. 4. 222. Sandy fields. Ann. 6.

ALOPECURUS. Fox-tail-grafs.

1. A. *pratenfis*, meadow. 11. 759. Paftures and meadows. Per. 5.
2. A. *alpinus*, alpine. 16. 1126. Highlands. Per. 7.

" Stem erect, fmooth. Spike ovate. Glumes of the calyx downy, without awns, and nearly as long as the awns of the corolla."—Found by the late Mr. G. Don on mountains about Loch Nagore, Aberdeenfhire. *Stem* a foot high. *Spike* white and downy, fcarcely an inch long.

3. A. *agreftis*, flender. 12. 848. Cornfields, and way fides. Ann. 7.
4. A. *bulbofus*, bulbous. 18. 1249. Salt marfhes. Per. 7.
5. A. *geniculatus*, floating. 18. 1250. Ponds and ditches. Per. 7.
6. A. *fulvus*, orange-fpiked. 21. 1467. Ponds. Per. 7.

" Stem afcending, bent at the joints. Spike compound, cylindrical. Glumes obtufe, hairy. Awn the length of the calyx. Anthers roundifh."—Larger than the laft. *Anthers* orange-coloured, opening at each fide by an oval orifice.

KNAPPIA. Knappia.

1. K. *agroftidea*, early. 16. 1127. Sandy places, rare. Ann. 3, 4.

POLYPOGON. Beard-grafs.

1. P. *monfpelienfis*, long-awned. 24. 1704. Salt marfhes. Ann. 7, 8.
2. P. *littoralis*, fhort-awned. 18. 1251. Muddy falt marfhes. Per. 8.

MILIUM. Millet-grafs.

1. M. *effufum*, fpreading. 16. 1106. Moift woods. Per. 6, 7.
2. M. *lendigerum*, clofe, or panick. 16. 1107. Low fields. Ann. 8.

AGROSTIS. Bent-grafs.

1. A. *Spica venti*, filky. 14. 951. Moift fandy fields. Ann. 6, 7.
2. A. *canina*, brown. 26. 1856. Moift paftures. Per. 7.
3. A. *fetacea*, briftly. 17. 1188. Dry heaths. Per. 7, 8.
4. A. *vulgaris*, fine. 24. 1671. Paftures and heaths. Per. 7.
5. A. *ftolonifera*, creeping. 22. 1532. Moift fields. Per. 7, 8.
6. A. *alba*, marfh. 17. 1189. Bogs and woods. Per. 7.

AIRA. Hair-grafs.

1. A. *criftata*, crefted. 9. 648. Dry paftures. Per. 7, 8.
2. A. *aquatica*, water. 22. 1557. Ponds, &c. Per. 5. 6.
3. A. *cæfpitofa*, turfy. 21. 1453. Moift ground. Per. 6, 7.
4. A. *lævigata*, fmooth-fheathed. 30. 2102. Highlands, and fea-coaft. Per. 5, 6.

" Leaves flat; with very fmooth fheaths. Panicle clofe. Petals awned, hairy at the bafe. Partial ftalk fmooth and very fhort."—Native of Lapland as well as Scotland. Generally viviparous. Not half fo tall as the laft.

5. A. *flexuofa*, wavy. 22. 1519. Sandy heaths. Per. 7.
6. A. *canefcens*, grey. 17. 1190. Sandy fhores. Per. 7.
7. A. *præcox*, early. 18. 1296. Dry gravelly places. Ann. 5, 6.
8. A. *caryophyllea*, filver. 12. 812. Barren heaths. Ann. 7.

HOLCUS. Soft-grafs.

1. H. *lanatus*, meadow. 17. 1169. Meadows and paftures. Per. 6, 7.
2. H. *mollis*, creeping. 17. 1170. Fields and woods. Per. 7, 8.
3. H. *avenaceus*, oat-like. 12. 813. Wafte ground. Per. 6, 7.

MELICA. Melic-grafs.

1. M. *uniflora*, wood. 15. 1058. Groves. Per. 5, 6.
2. M. *nutans*, mountain. 15. 1059. Mountain woods. Per. 6, 7.
3. M. *cærulea*, purple. 11. 750. Wet fandy ground. Per. 8.

SESLERIA. Moor-grafs.

1. S. *cærulea*, blue. 23. 1613. Limeftone rocks. Per. 4.

POA. Meadow-grafs.

1. P. *aquatica*, reed. 19. 1315. Ditches and rivers. Per. 7.
2. P. *fluitans*, flote. 22. 1520. Ponds and ditches. Per. 6—8.
3. P. *diftans*, reflexed. 14. 986. Wafte ground. Per. 7.
4. P. *maritima*, creeping fea. 16. 1140. Salt marfhes. Per. 7.
5. P. *procumbens*, procumbent fea. 8. 532. Near the fea. Ann. 7, 8.
6. P. *rigida*, hard. 20. 1371. Walls. Ann. 6.
7. P. *compreffa*, flat-ftalked. 6. 365. Walls, &c. Per. 7, 8.
8. P. *alpina*, alpine. 14. 1003. Highlands. Per. 7.
9. P. *flexuofa*, zig-zag. 16. 1123. Highlands. Per. 7.
10. P. *bulbofa*, bulbous. 15. 1071. Sea-coaft Per. 5, 6.
11. P. *cæfia*, fea-green. 24. 1719. Highlands. Per. 6, 7.
12. P. *trivialis*, roughifh. 15. 1072. Meadows and paftures. Per. 6—9.
13. P. *pratenfis*, fmooth-ftalked. 15. 1073. Mead. and paft. Per. 5, 6.
14. P. *humilis*, fhort blueifh. 14. 1004. Mountain paftures. Per. 6.
15. P. *annua*, annual. 16. 1141. Cultivated ground. Ann. 3—11.
16. P. *glauca*, flender glaucous. 24. 1720. Mountains. Per. 6, 7.
17. P. *nemoralis*, wood. 18. 1265. Woods. Per. 6.
18. P. *decumbens*, decumbent. 11. 792. Barren bogs. Per. 7.

BRIZA. Quaking-grafs.

1. B. *minor*, fmall. 19. 1316. Fields, rare. Ann. 7.
2. B. *media*, common. 5. 340. Paftures. Per. 5. 6.

DACTYLIS. Cock's-foot-grafs.

1. D. *ftricta*, fmooth. 6. 380. Muddy fea fhore. Per. 8.
2. D. *glomerata*, rough. 5. 335. Meadows and paftures. Per. 6—8.

CYNOSURUS. Dog's-tail-grafs.

1. C. *criftatus*, crefted. 5. 316. Paftures. Per. 7.
2. C. *echinatus*, rough. 19. 1333. Sandy ground. Ann. 7.

FESTUCA.

FESTUCA. Fefcue-grafs.

1. F. *ovina*, fheep's. 9. 585. Open paftures. Per. 6.
2. F. *vivipara*, viviparous. 19. 1355. Mountains. Per. 7.
3. F. *cæfia*, fea-green heath. 27. 1917. Dry heaths. Per. 6.

"Panicle pointing one way, clofe, glaucous. Florets cylindrical, roughifh, awned; inner glume rough-edged. Stem quadrangular. Leaves compreffed, channelled, glaucous."—About Bury, Suffolk, forming broad, depreffed, very glaucous tufts. *Stems* a fpan high.

4. F. *duriufcula*, hard. 7. 470. Meadows and paftures. Per. 6.
5. F. *rubra*, creeping. 29. 2056. Mountains and fea fhore. Per. 7.
6. F. *bromoides*, barren. 20 1411. Walls and fand. Ann. 6.
7. F. *myurus*, wall. 20. 1412. Walls and fand. Ann. 6.
8. F. *uniglumis*, fingle-hufked. 20. 1430. Sea fand. Ann. 6.
9. F. *triflora*, three-flowered. 27. 1918. Paftures. Per. 7.

"Panicle fpreading. Spikelets three-flowered, with long awns."—Like the following, but lefs drooping, and with fewer *florets*.

10. F. *gigantea*, tall. 26. 1820. Woods and hedges. Per. 7, 8.
11. F. *calamaria*, reed-like. 14. 1005. Mountain woods. Per. 7.
12. F. *decidua*, deciduous. 32. 2266. Mountain woods. Per. 8.

"Panicle pointing one way, erect, much branched. Florets two or three, oblong, angular, beardlefs; the upper ones deciduous. Leaves linear, ftriated."—Lower and much more flender than the laft. The lowermoft *floret* only ripens feed.

13. F. *loliacea*, fpiked. 26. 1821. Moift paftures. Per. 6, 7.
14. F. *pratenfis*, meadow. 23. 1592. Meadows and paft. Per. 6, 7.
15. F. *elatior*, tall. 23. 1593. Moift meadows. Per. 6, 7.

BROMUS. Brome-grafs.

1. B. *fecalinus*, fmooth rye. 17. 1171. Corn-fields. Ann. 7.
2. B. *multiflorus*, downy rye. 27. 1884. Corn-fields. Ann. 7.
3. B. *mollis*, foft. 15. 1078. Paftures, &c. Bienn. 6.
4. B. *racemofus*, fmooth. 15. 1079. Paft. and meadows. Ann. 6.

†5. B. *fquarrofus*, corn. 27. 1885. Corn-fields. Ann. 7.
6. B. *arvenfis*, taper field. 28. 1984. Fields. Ann. 7.
7. B. *pratenfis*, tumid field. 13. 920 (arvenfis). Fields. Ann. 6.

"Panicle fpreading, compound. Spikelets ovate, turgid, eight or ten-flowered. Florets elliptical, broad, imbricated, fmoothifh, with three equidiftant ribs at each fide."—Two feet high. *Panicle* fmaller and more erect than in the laft, but the *fpikelets* are larger, more tumid, and greener. The true *arvenfis* has only two clofe ribs on each fide the keel of the *glume*.

8. B. *erectus*, upright perennial. 7. 471. Chalky paft. Per. 7.
9. B. *afper*, hairy wood. 17. 1172. Moift woods. Ann. Biennial. 7.
10. B. *fterilis*, barren. 15. 1030. Wafte ground, and fields. Ann. 6, 7.
11. B. *diandrus*, upright annual. 14. 1006. Walls and fand. Ann. 6.
12. B. *fylvaticus*, flender wood. 11. 729. Thickets and hedges. Per. 7.
13. B. *pinnatus*, fpiked heath. 11. 730. Chalky heaths. Per. 7.

STIPA. Feather-grafs.

†1. S. *pennata*, plumy. 19. 1356. Rocks. Per. 7.

AVENA. Oat-grafs.

1. A. *fatua*, wild haver. 31. 2221. Fields. Ann. 8.
2. A. *ftrigofa*, briftle-pointed oat. 18. 1266. Corn-fields. Ann. 7.

This is now admitted as a native fpecies, in confequence of its having been found in Scotland, Wales, Yorkfhire, and Cornwall, notwithftanding the contrary opinion expreffed in Fl. Brit. 140. See AVENA, n. 22.

3. A. *pubefcens*, downy. 23. 1640. Chalky paftures. Per. 6.
4. A. *pratenfis*, narrow leaved. 17. 1204. Limeftone foil. Per. 7.
5. A. *planiculmis*, flat-ftrawed. 30. 2141. Highland mountains. Per. 7.

"Panicle erect. Calyx containing about five florets. Receptacles bearded upwards. Leaves naked, finely ferrated, with rough fheaths. Stem compreffed."—Like *A. pubefcens* in general afpect, but larger in every part, and the *leaves* are naked, not downy; their edges finely ferrated, as in *pratenfis*. *Flowers* much larger than in either of thofe.

6. A. *flavefcens*, yellow. 14. 952. Paftures and wafte ground. Per. 6, 7.

LAGURUS. Hare's-tail-grafs.

1. L. *ovatus*, ovate. 19. 1334. Sands in Guernfey. Ann. 6.

ARUNDO. Reed.

1. A. *Phragmites*, common. 6. 401. Fens and ditches. Per. 7.
2. A. *epigejos*, wood. 6. 402. Moift woods. Per. 7.
3. A. *Calamagroftis*, fmall. 30. 2159. Moift woods and fens. Per. 7.
4. A. *ftricta*, fmalleft clofe. 30. 2160. Marfhes, Scotland. Per. 6.

"Calyx fingle-flowered, full as long as the corolla. Panicle erect, clofe. Flowers fcattered, erect, with a dorfal awn. Down fhorter than the corolla."—Half the fize of the laft. *Calyx* acute, but without elongated points. *Stipula* very fhort. The *panicle* is of a purplifh bronze hue, not unlike *Melica cærulea*.

5. A. *arenaria*, fea. 8. 520. Sandy fea-coaft. Per. 7.

LOLIUM. Darnel.

1. L. *perenne*, perennial. 5. 315. Meadows and paftures. Per. 6.
2. L. *temulentum*, bearded. 16. 1124. Fields. Ann. 7.

SHERARDIA. Field-madder.

1. S. *arvenfis*, blue. 13. 891. Corn-fields. Ann. 5—8.

ASPERULA. Wood-ruff.

1. A. *odorata*, fweet. 11. 755. Woods. Per. 5.
2. A. *cynanchica*, fmall. 1. 33. Chalky hills. Per. 6.

GALIUM. Bed-ftraw.

1. G. *cruciatum*, crofs-wort. 2. 143. Thickets and hedges. Per. 5.
2. G. *paluftre*, white water. 26. 1857. Moift meadows. Per. 7.
3. G. *Witheringii*, rough heath. 31. 2206. Moift hills. Per. 7.
4. G. *faxatile*, fmooth heath. 12. 815. Heaths and dry hills. Per. 7, 8.
5. G. *uliginofum*, rough marfh. 28. 1972. Ditches. Per. 8.
6. G. *erectum*, upright. 29. 2067. Moift paftures. Per. 6, 7.
7. G. *verrucofum*, warty-fruited. 31. 2173. Corn-fields. Ann. 6—8.

This is the *Valantia Aparine* of Linnæus, whofe feeds, befet with large tubercles, are compared by Tournefort and Vaillant to coriander comfits.

8. G. *tricorne*, three-flowered. 23. 1641. Corn-fields. Ann. 7.
9. G. *fpurium*, fmooth-feeded corn. 26. 1871. Corn-fields, rare. Ann. 6, 7.
10. G. *pufillum*, leaft mountain. 2. 74. Limeftone hills. Per. 7, 8.
11. G. *verum*, yellow. 10. 660. Fields and hills. Per. 7, 8.
12. G. *Mollugo*, great hedge. 24. 1673. Hedges. Per. 7, 8.
13. G. *anglicum*, wall. 6. 384. Old walls. Ann. 6, 7.
14. G. *boreale*, crofs-leaved. 2. 105. Rocky hills. Per. 7.
15. G. *Aparine*, goofe-grafs. 12. 816. Hedges, common. Ann. 5—8.

RUBIA. Madder.

1. R. *peregrina*, wild. 12. 851. Rocks in the fouth. Per. 6, 7.

EXACUM. Gentianella.

1. E. *filiforme*, leaft. 4. 235. Sandy marfhes. Ann. 7.

PLANTAGO. Plantain.

1. P. *major*, greater. 22. 1558. Paftures and cultivated ground. Per. 5—9.
2. P. *media*, hoary. 22. 1559. Chalky hills. Per. 5—8.
3. P. *lanceolata*, rib-wort. 8. 507. Meadows and paftures. Per. 6, 7.
4. P. *maritima*, fea. 3. 175. Sea-coaft and lofty mountains. Per. 8.
5. P. *Coronopus*, buck's-horn. 13. 892. Sandy paftures. Ann. 5—8.

CENTUNCULUS. Chaff-weed.

1. C. *minimus*, fmall. 8. 531. Inundated heaths. Ann. 6, 7.

SANGUISORBA. Burnet.

1. S. *officinalis*, great. 19. 1312. Meadows and paftures Per. 6.

EPIMEDIUM. Barren-wort.

1. E. *alpinum*, alpine. 7. 438. Mountain thickets, rare. Per. 5.

CORNUS. Cornel.

1. C. *fanguinea*, wild. 4. 249. Hedges. Shrub. 6.
2. C. *Suecica*, dwarf. 5. 310. Alpine meadows. Per. 6, 7.

PARIETARIA. Pellitory.

1. P. *officinalis*, wall. 13. 879. Old walls. Per. 6—9.

ALCHEMILLA. Ladies'-mantle.

1. A. *vulgaris*, common. 9. 597. Meadows and paftures. Per. 6, 7.
2. A. *alpina*, alpine. 4. 244. Micaceous rocks. Per. 7.

3. A. *arvensis*, field. 15. 1011. Fallow fields. Ann. 5—8.

Ord. 2. *Digynia.*

Buffonia. *Buffonia.*

†1. B. *tenuifolia*, slender. 19. 1313. Sea-coast? Ann. 6.

Ord. 3. *Tetragynia.*

Ilex. *Holly.*

1. I. *Aquifolium*, common. 7. 496. Woods and hedges. Tree. 5.

Potamogeton. Pond-weed.

1. P. *natans*, broad-leaved. 26. 1822. Ponds and rivers. Per. 7.
2. P. *heterophyllum*, various-leaved. 18. 1285. Ditches and pools. Per. 7—9.
3. P. *perfoliatum*, perfoliate. 3. 168. Rivers and pools. Per. 7, 8.
4. P. *densum*, close-leaved. 6. 297. Pools and slow streams. Per. 6.
5. P. *fluitans*, long-leaved floating. 18. 1286. Ditches and rivulets. Per. 8, 9.
6. P. *lucens*, shining. 6. 376. Rivers, pools and lakes. Per. 6, 7.
7. P. *lanceolatum*, lanceolate. 28. 1985. Lakes, Wales. Per. 8.
8. P. *crispum*, curled. 15. 1012. Pools and rivers. Per. 6, 7.
9. P. *compressum*, flat-stalked. 6. 418. Rivers and ditches. Per. 6, 7.
10. P. *gramineum*, grassy. 32. 2253. Rivers and ditches. Per. 7.
11. P. *pusillum*, small. 3. 215. Clay-pits. Per. 7.
12. P. *pectinatum*, fennel-leaved. 5. 323. Rivers and marine ditches. Per. 7.

Ruppia. Ruppia.

1. R. *maritima*, sea. 2. 136. Salt-water ditches. Per? 7.

Sagina. Pearl-wort.

1. S. *procumbens*, procumbent. 13. 880. Sandy wastes. Per. 5—8.
2. S. *maritima*, sea. 31. 2195. Sea-coast, and mountains. Ann. 5—8.
3. S. *apetala*, small-flowered. 13. 881. Sandy wastes. Ann. 5, 6.
4. S. *erecta*, upright. 9. 609. Gravelly pastures. Ann. 5.

Tillæa. Tillæa.

1. T. *muscosa*, mossy. 2. 116. Sandy heaths. Ann. 5, 6.

Radiola. Flax-seed.

1. R. *millegrana*, thyme-leaved. 13. 893. Wet sand. Ann. 7, 8.

Class 5. Pentandria.

Ord. 1. *Monogynia.*

Myosotis. Scorpion-grass.

1. M. *arvensis*, field. 36. 2558. Dry fields. Ann. 6.

" Seeds smooth. Leaves oblong. Branches spreading. Clusters many-flowered, without bracteas; their lower stalks axillary and remote. Calyx ovate, with spreading incurved bristles."—See Myosotis, n. 1; where the author, Mr. Drake, has mentioned two varieties. The β is our following species, *versicolor*; the γ is also probably distinct, but has not yet been published as such in Engl. Bot.

2. M. *versicolor*, yellow and blue. 7. 480. f. 1. Barren fields. Ann. 6.

" Seeds smooth. Leaves oblong. Branches ascending. Clusters many-flowered, on long naked stalks, without bracteas. Calyx ovate, with spreading incurved bristles."—Found sometimes also in boggy meadows. The *flowers* are yellow when they first open.

3. M. *palustris*, water. 28. 1973. Ditches and pools. Per. 7, 8.
4. M. *rupicola*, rock. 36. 2559. Highland rocks. Per. 7.

" Seeds smooth. Leaves oblong; the radical ones on long footstalks. Clusters many-flowered, without bracteas. Calyx divided above half way down, its hairs copious, spreading and elongated."—Most like the last; with still larger blue *flowers*.

Lithospermum. Gromwell.

1. L. *officinale*, common. 2. 134. Chalky hills. Per. 5.
2. L. *arvense*, corn. 2. 123. Fields. Ann. 5, 6.
3. L. *purpuro-cæruleum*, creeping. 2. 117. Chalky thickets, rare. Per. 5.

Anchusa. Alkanet.

1. A. *officinalis*, common. 11. 662. Rubbish by the sea. Per. 6, 7.
2. A. *sempervirens*, evergreen. 1. 45. Waste ground, rare. Per. 5, 6.

Cynoglossum. Hound's-tongue.

1. C. *officinale*, common. 13. 921. Waste ground. Bienn. 6.
2. C. *sylvaticum*, green-leaved. 23. 1642. Shady hedges. Bienn. 6.

Pulmonaria. Lung-wort.

1. P. *officinalis*, common. 2. 118. Groves, rare. Per. 5.
2. P. *angustifolia*, narrow-leaved. 23. 1628. Groves, rare. Per. 5.
3. P. *maritima*, sea. 6. 368. Sandy shores. Per. 7.

Symphytum. Comfrey.

1. S. *officinale*, common. 12. 817. Watery places. Per. 5, 6.
2. S. *tuberosum*, tuberous-rooted. 21. 1502. Moist groves. Per. 7.

Borago. Borage.

*1. B. *officinalis*, common. 1. 36. Waste ground. Bienn. 6, 7.

Asperugo. Madwort.

1. A. *procumbens*, procumbent. 10. 661. Waste ground, rare. Ann. 5.

Lycopsis. Bugloss.

1. L. *arvensis*, small. 14. 938. Fields and hedges. Ann. 6, 7.

ECHIUM. Viper's-buglofs.

1. E. *italicum*, white. 29. 2081. Sandy fields, rare. Bienn. 7.
2. E. *vulgare*, common blue. 3. 181. Fields and walls. Bienn. 6, 7.

PRIMULA. Primrofe.

1. P. *vulgaris*, common. 1. 4. Groves and banks. Per. 4.
2. P. *elatior*, ox-lip. 8. 513. Groves, rare. Per. 4.
3. P. *veris*, cowflip. 1. 5. Meadows and paftures. Per. 4, 5.
4. P. *farinofa*, bird's-eye. 1. 6. Mountain bogs. Per. 6, 7.

CYCLAMEN. Cyclamen.

*1. C. *europæum*, fpring. 8. 548. Groves, rare. Per. 4.

MENYANTHES. Buck-bean.

1. M. *trifoliata*, common. 7. 495. Wet meadows. Per. 6, 7.
2. M. *nymphæoides*, fringed. 4. 217. Rivers. Per. 8.

HOTTONIA. Water-violet.

1. H. *paluftris*, common. 6. 364. Pools and ditches. Per. 6, 7.

LYSIMACHIA. Loofeftrife.

1. L. *vulgaris*, yellow. 11. 761. Watery thickets. Per. 7.
2. L. *thyrfiflora*, tufted. 3. 176. Bogs, rare. Per. 7.
3. L. *nemorum*, wood. 8. 527. Groves. Per. 5–9.
4. L. *Nummularia*, creeping. 8. 528. Shady rills. Per. 6, 7.

ANAGALLIS. Pimpernel.

1. A. *arvenfis*, fcarlet. 8. 529. Fields and gardens. Ann. 6, 7.
2. A. *cærulea*, blue. 26. 1823. Fields, rare. Ann. 6, 7.
3. A. *tenella*, bog. 8. 530. Bogs and fprings. Per. 7, 8.

AZALEA. Azalea.

1. A. *procumbens*, trailing. 13. 865. Alpine heaths. Small fhrub. 7.

CONVOLVULUS. Bind-weed.

1. C. *arvenfis*, fmall. 5. 312. Gravelly paftures. Per. 6, 7.
2. C. *fepium*, great. 5. 313. Moift hedges. Per. 7, 8.
3. C. *Soldanella*, fea. 5. 314. Sandy fea-coaft. Per. 7.

POLEMONIUM. Jacob's-ladder.

1. P. *cæruleum*, blue. 1. 14. Mountain thickets, rare. Per. 6.

CAMPANULA. Bell-flower.

1. C. *rotundifolia*, round-leaved. 13. 866. Heaths and banks. Per. 8, 9.
2. C. *patula*, fpreading. 1. 42. Paftures, rare. Bienn. 7, 8.
3. C. *Rapunculus*, rampion. 4. 283. Banks. Bienn. 7, 8.
4. C. *latifolia*, giant. 5. 302. Woods and fhady rocks. Per. 8.
5. C. *rapunculoides*, creeping. 20. 1369. Woods, rare. Per. 8.
6. C. *Trachelium*, nettle-leaved. 1. 12. Groves and hedges. Per. 7.
7. C. *glomerata*, cluftered. 2. 90. Chalky hills. Per. 7, 8.
8. C. *hybrida*, corn. 6. 375. Chalky fields. Ann. 8.
9. C. *hederacea*, ivy-leaved. 2. 73. Shady rills, rare. Per. 6–8.

PHYTEUMA. Rampion.

1. P. *orbiculare*, round-headed. 2. 142. Chalky hills, rare. Per. 8.

JASIONE. Sheep's-bit.

1. J. *montana*, fcabious. 13. 882. Sandy paftures. Ann. 6, 7.

LOBELIA. Lobelia.

1. L. *Dortmanna*, water. 2. 140. Lakes, rare. Per. 7.
2. L. *urens*, acrid. 14. 953. Moift heaths, rare. Per. 8, 9.

IMPATIENS. Balfam.

1. I. *Noli-me-tangere*, yellow. 14. 937. Shady fprings, rare. Ann. 8.

VIOLA. Violet.

1. V. *hirta*, hairy. 13. 894. Limeftone woods. Per. 4
2. V. *odorata*, fweet. 9. 619. Groves and banks Per. 3, 4.
3. V. *paluftris*, marfh. 7. 444. Moffy bogs. Per. 4.
4. V. *canina*, dog's. 9. 620. Groves and heaths. Per. 4–6.
5. V. *lactea*, cream-coloured. 7. 445. Mountainous heaths. Per. 5.
6. V. *tricolor*, common panfy. 18. 1287. Fields. Ann. 5—9.
7. V. *lutea*, yellow mountain. 11. 721. Mountain bogs. Per. 5—9.

VERBASCUM. Mullein.

1. V. *Thapfus*, great. 8. 549. Hedges and way fides. Bienn. 7, 8.
2. V. *Lychnitis*, white. 1. 58. Chalky banks. Bienn. 7, 8.
3. V. *pulverulentum*, yellow hoary. 7. 487. Gravelly banks. Bienn. 7.
4. V. *nigrum*, dark, or black. 1. 59. Gravel or chalk. Per. 7, 8.
5. V. *virgatum*, large-flowered. 8. 550. Gravelly fields, rare. Bienn. 8.
6. V. *Blattaria*, moth. 6. 393. Gravelly fields. Ann. 7.

DATURA. Thorn-apple.

*1. D. *Stramonium*, prickly. 18. 1288. Dunghills and waftes. Ann. 7.

HYOSCYAMUS. Hen-bane.

1. H. *niger*, common. 9. 591. Wafte ground. Ann. 7.

ATROPA. Deadly-nightfhade.

1. A. *Belladonna*, common, or dwale. 9. 592. Chalky hills. Per. 6.

SOLANUM. Nightfhade.

1. S. *Dulcamara*, woody. 8. 565. Hedges. Shrub. 6, 7.
2. S. *nigrum*, common, or garden. 8. 566. Cultivated ground. Ann. 6—9.

CHIRONIA. Centaury.

1. C. *Centaurium*, common. 6. 417. Gravelly paftures. Ann. 7, 8.
2. C. *littoralis*, dwarf tufted. 33. 2305. Sea-coaft. Ann. 6.

" Stems herbaceous, fimple, ftraight. Leaves linear-obovate. Calyx-teeth awl-fhaped. Flowers denfely corymbofe, nearly feffile."—About two inches high. *Flowers* large and handfome. Diftinct from the varieties of the foregoing mentioned under CHIRONIA, n. 11.

3. C. *pulchella*, dwarf branched. 7. 458. Sandy fea-coaft. Ann. 8, 9.

SAMOLUS. Brook-weed.

1. S. *Valerandi*, pimpernel. 10. 703. Marfhes. Per. 7.

LONICERA. Honeyfuckle.

1. L. *Caprifolium*, pale perfoliate. 12. 799. Groves and coppices. Shrub. 5, 6.
2. L. *Periclymenum*, common woodbine. 12. 800. Woods and hedges. Shrub. 6, 7.
3. L. *Xylofteum*, upright. 13. 916. Thickets, rare. Shrub. 7.

RHAMNUS. Buckthorn.

1. R. *catharticus*, common. 23. 1629. Hedges. Shrub. 5, 6.
2. R. *Frangula*, alder-leaved. 4. 250. Woods and thickets. Shrub. 5.

EUONYMUS. Spindle-tree.

1. E. *europæus*, common. 6. 362. Hedges and woods. Shrub. 5.

RIBES. Currant.

1. R. *rubrum*, red. 18. 1289. Shady banks of northern rivers. Shrub. 5.
2. R. *alpinum*, taftelefs mountain. 10. 704. Woods and thickets. Shrub. 4, 5.
3. R. *fpicatum*, acid mountain. 18. 1290. Mountain woods. Shrub. 5.
4. R. *petræum*, rock. 10. 705. Mountains. Shrub. 5.
5. R. *nigrum*, black. 18. 1291. Wet thickets. Shrub. 5.
*6. R. *Groffularia*, rough goofeberry. 18. 1292. Hedges. Shrub. 4.
*7. R. *Uva crifpa*, fmooth goofeberry. 29. 2057. Hedges. Shrub. 4.

HEDERA. Ivy.

1. H. *Helix*, common. 18. 1267. Woods and walls. Shrub. 10.

ILLECEBRUM. Knot-weed.

1. I. *verticillatum*, whorled. 13. 895. Sea marfhes, Dev. and Corn. Per. 7.

GLAUX. Salt-weed.

1. G. *maritima*, fea, or black. 1. 13. Muddy falt-marfhes. Per. 6, 7.

THESIUM. Baftard Toad-flax.

1. T. *linophyllum*, common. 4. 247. Chalky hills. Per. 7.

VINCA. Periwinkle.

1. V. *minor*, leffer. 13. 917. Banks and groves. Per. 5.
2. V. *major*, greater. 8. 514. Woods and hedges. Per. 5.

Ord. 2. *Digynia.*

HERNIARIA. Rupture-wort.

1. H. *glabra*, fmooth. 3. 206. Sand or gravel. Per. 7, 8.
2. H. *hirfuta*, hairy. 20. 1379. Sand, rare. Per. 7, 8.

CHENOPODIUM. Goofefoot.

1. C. *Bonus Henricus*, perennial. 15. 1033. Wafte ground. Per. 5, 6.
2. C. *urbicum*, upright. 10. 717. Dunghills and banks. Ann. 8, 9.
3. C. *rubrum*, red. 24. 1721. Wafte ground. Ann. 8.
4. C. *botryodes*, many-cluftered. 32. 2247. Sea marfhes. Ann. 8.

" Leaves triangular, fomewhat toothed; the upper ones bluntifh. Clufters upright, compound, rounded, leafy." *Leaves* much fmaller, and more flefhy, than in the laft, of which it has long been taken for a maritime variety.

5. C. *murale*, nettle-leaved. 24. 1722. Walls and banks. Ann. 8, 9.
6. C. *hybridum*, maple-leaved. 27. 1919. Moift wafte ground. Ann. 8.
7. C. *album*, white. 24. 1723. Fields and gardens, common. Ann. 7, 8.
8. C. *ficifolium*, fig-leaved. 24. 1724. Dunghills and fields. Ann. 8.
9. C. *glaucum*, oak-leaved. 21. 1454. Sandy fields. Ann. 8.
10. C. *olidum*, ftinking. 15. 1034. Near the fea. Ann. 8.
11. C. *polyfpermum*, round-leaved. 21. 1480. Dunghills, &c. Ann. 7, 8.
12. C. *acutifolium*, fharp entire-leaved. 21. 1481. Wafte ground. Ann. 7, 8.

" Leaves ovate, acute, entire. Stem erect. Clufters fomewhat cymofe, elongated, leaflefs."—Differs from the laft, with which it has generally been confounded, in its erect, more angular *ftem*, and fharp-pointed *leaves*. The *clufters* alfo are fpiked rather than cymofe.

BETA. Beet.

1. B. *maritima*, fea. 4. 285. Muddy fea-fhores. Per. 8.

SALSOLA. Salt-wort.

1. S. *Kali*, prickly. 9. 634. Sandy beach. Ann. 7.
2. S. *fruticofa*, fhrubby. 9. 635. Norfolk and fouthern coafts. Shrub. 7, 8.

ULMUS. Elm.

1. U. *campeftris*, common, or Norfolk. 27. 1886. Woods and hedges. Tree. 4.
2. U. *fuberofa*, cork-barked, or Suffex. 31. 2161. Woods and hedges. Tree. 3.
3. U. *glabra*, fmooth, or wych. 32. 2248. Hedges, Effex. Tree. 3.
4. U. *montana*, broad-leaved, or wych hazel. 27. 1887. Woods and hedges. Tree. 4.
*5. U. *major*, Dutch. 36. 2542. Hedges. Tree. 3.

CUSCUTA. Dodder.

1. C. *europæa*, greater. 6. 378. On thiftles and nettles. Ann. 8, 9.
2. C. *Epithymum*, leffer. 1. 55. On heath and thyme. Per? 8.

SWERTIA. Felwort.

†1. S. *perennis*, marsh. 21. 1441. Alpine bogs. Per. 8.

GENTIANA. Gentian.

1. G. *Pneumonanthe*, marsh. 1. 20. Moist heaths. Per. 8, 9.
2. G. *acaulis*, dwarf. 23. 1594. South Wales. Per. 5.
3. G. *verna*, spring. 7. 493. Barren mountains. Per. 4.
4. G. *nivalis*, small alpine. 13. 896. Highland rocks. Ann. 8.
5. G. *Amarella*, autumnal. 4. 236. Limestone pastures. Ann. 8.
6. G. *campestris*, field. 4. 237. Gravelly pastures. Ann. 9.

Umbelliferous plants.

ERYNGIUM. Eryngo.

1. E. *maritimum*, sea. 10. 718. Sandy beach. Per. 7, 8.
2. E. *campestre*, field. 1. 57. Waste ground, rare. Per. 7, 8.

HYDROCOTYLE. White-rot.

1. H. *vulgaris*, marsh. 11. 751. Watery ground. Per. 5, 6.
2. H. *inundata*, floating. 4. 227. Ditches and pools. Bienn ? 5.

SANICULA. Sanicle.

1. S. *europæa*, wood. 2. 98. Groves. Per. 5.

BUPLEURUM. Hare's-ear.

1. B. *rotundifolium*, round-leaved. 2. 99. Chalky fields. Ann. 7.
2. B. *odontites*, narrow-leaved. 35. 2468. Rocks, Devon. Ann. 7.
3. B. *tenuissimum*, slender. 7. 478. Muddy salt-marshes. Ann. 7, 8.

ECHINOPHORA. Prickly-Sampire.

†1. E. *spinosa*, great. 34. 2413. Sandy sea-coast. Per. 7.

TORDYLIUM. Hart-wort.

†1. T. *officinale*, smaller. 34. 2440. Fields, rare. Ann. 6, 7.
2. T. *maximum*, great. 17. 1173. Chalky ground, rare. Ann. 6, 7.

CAUCALIS. Bur-parsley.

1. C. *daucoides*, small. 3. 197. Chalky fields. Ann. 6.
2. C. *latifolia*, great. 3. 198. Chalky fields, rare. Ann. 7.
3. C. *Anthriscus*, upright. 14. 987. Hedges and banks. Ann. 7.
4. C. *infesta*, spreading. 19. 1314. Fields and hedges. Ann. 7.
5. C. *nodosa*, knotted. 3. 199. Gravelly banks. Ann. 5, 6.

DAUCUS. Carrot.

1. D. *Carota*, wild. 17. 1174. Borders of fields. Bienn. 6, 7.
2. D. *maritimus*, sea-coast. 36. 2560. Cornwall. Bienn. 7, 8.

" Fruit armed with compressed teeth. Leaflets dilated, succulent, hairy, with rounded segments. Umbels convex when in seed."—About 18 inches high, woolly rather than hairy, of a more fleshy habit than the foregoing. The *umbels* want the remarkable dark-red central abortive *flower*, which is characteristic of *D. Carota*. The compressed teeth which clothe the *seeds* approach to the nature of *D. mauritanicus* and *muricatus*.

BUNIUM. Earth-nut.

1. B. *Bulbocastanum*, common. 14. 988. Pastures. Per. 5, 6.

The *B. Bulbocastanum* and *flexuosum* of Withering, and of Sm. Fl. Brit. 301, prove, on mature examination, to be, as Linnæus considered them, one and the same species. The *root* of the former, being near the surface, its *stem* has no elongated tapering base, and if the herb happens to be luxuriant, the leaves of the general *involucrum* are more numerous than otherwise.

CONIUM. Hemlock.

1. C. *maculatum*, common. 17. 1191. Hedges. Bienn. 6, 7.

SELINUM. Milky-parsley.

1. S. *palustre*, marsh. 4. 229. Wet meadows. Per. 7.

ATHAMANTA. Stone-parsley.

1. A. *Libanotis*, mountain. 2. 138. Chalky pastures, rare. Per. 8.

PEUCEDANUM. Sulphur-wort

1. P. *officinale*, sea. 25. 1767. Salt marshes. Per. 6, 7.
2. P. *Silaus*, meadow. 30. 2142. Moist pastures. Per. 8.

CRITHMUM. Sampire.

1. C. *maritimum*, sea. 12. 819. Sea cliffs. Per. 8.

HERACLEUM. Cow-parsnep.

1. H. *Sphondylium*, common. 14. 939. Borders of fields. Bienn. 7.

H. *angustifolium*, Fl. Brit. 307, proves, on a careful examination, to be only a narrow-leaved variety of this, distinct from the true *angustifolium* of Linnæus.

LIGUSTICUM. Lovage.

1. L. *scoticum*, Scottish. 17. 1207. Scottish coast. Per. 7.
2. L. *cornubiense*, Cornish. 10. 683. Thickets, Cornwall. Per. 7.
3. L. *Meum*, spignel. 32. 2249. Mountain pastures. Per. 5.

ANGELICA. Angelica.

*1 A. *Archangelica*, garden. 36. 2561. Wet meadows, rare. Bienn. 9.
2. A. *sylvestris*, wild. 16. 1128. Watery places. Per. 7.

SIUM. Water-parsnep.

1. S. *latifolium*, broad-leaved. 3. 204. Rivers and ditches. Per. 7, 8.
2. S. *angustifolium*, narrow-leaved. 2. 139. Rivers and ditches. Per. 7, 8.
3. S. *nodiflorum*, procumbent. 9. 639. Ditches and rivulets. Per. 7, 8.
4. S. *repens*, creeping. 20. 1431. Watery ground. Per. 6—8.
5. S. *verticillatum*, whorled. 6. 395. Salt meadows. Per. 7, 8.

SISON.

SISON. Hone-wort.

1. S. *Amomum*, hedge. 14. 954. Moift chalk or marl. Ann. 8.
2. S. *fegetum*, corn. 4. 228. Chalky fields, rare. Ann. 8.

OENANTHE. Water-Dropwort.

1. O. *fiftulofa*, common. 6. 363. Ditches and bogs. Per. 7, 8.
2. O. *pimpinelloides*, parfley. 5. 347. Salt marfhes. Per. 7.
3. O. *peucedanifolia*, fulphur-wort. 5. 348. Ditches and bogs. Per. 6.
4. O. *crocata*, hemlock. 33. 2313. Watery places. Per. 7.

CORIANDRUM. Coriander.

*1. C. *fativum*, common. 1. 67. Fields and dunghills, rare. Ann. 6.

PHELLANDRIUM. Water-Hemlock.

1. P. *aquaticum*, common. 10. 684. Ditches and rivers. Bienn. 6, 7.

CICUTA. Cowbane.

1. C. *virofa*, water. 7. 479. Rivers and ditches. Per. 8.

AETHUSA. Fool's-Parfley.

1. A. *Cynapium*, common. 17. 1192. Cultivated ground. Ann. 7, 8.

SCANDIX. Chervil.

1. S. *odorata*, great or fweet. 10. 697. Mountain paftures. Per. 5.
2. S. *Pecten-Veneris*, needle. 20. 1397. Corn-fields. Ann. 6, 7.
*3. S. *Cerefolium*, garden. 18. 1268. Banks and hedges. Ann. 6.
4. S. *Anthrifcus*, rough. 12. 818. Hedges and rubbifh. Ann. 5.

CHÆROPHYLLUM. Cow-Parfley.

1. C. *fylveftre*, fmooth-ftalked. 11. 752. Hedges and thickets. Per. 4, 5.
2. C. *temulentum*, rough-ftalked. 22. 1521. Hedges and groves. Bienn. 6, 7.
3. C. *aureum*, tawny-feeded. 30. 2103. Borders of fields, Scotland. Per. 6.

IMPERATORIA. Mafter-wort.

1. I. *Oftruthium*, great. 20. 1380. Moift mountain paftures. Per. 6.

PASTINACA. Parfnep.

1. P. *fativa*, wild. 8. 556. Chalky banks. Bienn. 7.

SMYRNIUM. Alexanders.

1. S. *Olufatrum*, common. 4. 230. Ruins, and fea cliffs. Bienn. 5.

ANETHUM. Fennel.

1. A. *Fœniculum*, common. 17. 1208. Chalk cliffs. Bienn. 7, 8.

CARUM. Caraway.

*1. C. *Carui*, common. 21. 1503. Meadows and paftures. Bienn. 6.

PIMPINELLA. Burnet-Saxifrage.

1. P. *faxifraga*, common. 6. 407. Dry chalky paftures. Per. 7, 8.
2. P. *magna*, great. 6. 408. Limeftone groves. Per. 7, 8.
3. P. *dioica*, dwarf. 17. 1209. Limeftone rocks, rare. Per. 5, 6.

APIUM. Celery.

1. A. *graveolens*, wild. 17. 1210. Ditches and marfhes. Bienn. 8.

AEGOPODIUM. Gout-weed.

1. A. *Podagraria*, common. 14. 940. Shady cultivated ground. Per. 5, 6.

Ord. 3. *Trigynia*.

VIBURNUM. Guelder-rofe.

1. V. *Lantana*, mealy. 5. 331. Chalky hedges. Shrub. 5.
2. V. *Opulus*, common. 5. 332. Watery groves and hedges. Shrub. 6.

SAMBUCUS. Elder.

1. S. *Ebulus*, dwarf. 7. 475. Wafte ground, rare. Per. 7.
2. S. *nigra*, common. 7. 476. Wood and hedges. Small tree. 6.

STAPHYLEA. Bladder-nut.

*1. S. *pinnata*, common. 22. 1560. Hedges, rare. Shrub. 6.

TAMARIX. Tamarifk.

1. T. *gallica*, common, or French. 19. 1318. South coaft. Shrub. 7.

CORRIGIOLA. Strap-wort.

1. C. *littoralis*, fand. 10. 668. South-weft coaft. Ann. 7, 8.

Ord. 4. *Tetragynia*.

PARNASSIA. Grafs of Parnaffus.

1. P. *paluftris*, common. 2. 82. Boggy moors. Per. 9, 10.

Ord. 5. *Pentagynia*.

STATICE. Sea Lavender.

1. S. *Armeria*, thrift. 4. 226. Mountains, and fea fhore. Per. 7, 8.
2. S. *Limonium*, common. 2. 102. Muddy fea fhore. Per. 7, 8.
3. S. *reticulata*, matted. 5. 328. Norfolk coaft. Per. 7, 8.

LINUM. Flax.

1. L. *ufitatiffimum*, common. 19. 1357. Fields. Ann. 7.
2. L. *perenne*, perennial blue. 1. 40. Chalky hills. Per. 6, 7.
3. L. *anguftifolium*, narrow-leaved pale. 6. 381. Sand or limeftone. Per. 7.
4. L. *catharticum*, purging. 6. 382. Dry paftures. Ann. 6—8.

SIBBALDIA. Sibbaldia.

1. S. *procumbens*, procumbent. 13. 897. Scottifh mountains. Per. 7.

Ord. 6.

Ord. 6. *Hexagynia.*

DROSERA. Sun-dew.

1. D. *rotundifolia*, round-leaved. 13. 867. Turfy bogs. Per. 7, 8.
2. D. *longifolia*, long-leaved. 13. 868. Turfy bogs. Per. 7, 8.
3. D. *anglica*, great. 13. 869. Bogs, rare. Per. 7, 8.

Ord. 7. *Polygynia.*

MYOSURUS. Moufetail.

1. M. *minimus*, leaft. 7. 435. Gravelly corn-fields. Ann. 5.

Clafs 6. HEXANDRIA.

Ord. 1. *Monogynia.*

GALANTHUS. Snowdrop.

1. G. *nivalis*, common. 1. 19. Meadows and orchards. Per. 2.

LEUCOJUM. Snowflake.

1. L. *æftivum*, fummer. 9. 621. Moift meadows. Per. 5.

NARCISSUS. Narciffus.

1. N. *poeticus*, poetic. 4. 275. Sandy downs. Per. 5.
2. N. *biflorus*, pale. 4. 276. Sandy downs. Per. 4, 5.
3. N. *Pfeudo-narciffus*, daffodil. 1. 17. Woods and paftures. Per. 3.

ALLIUM. Garlick.

1. A. *Ampeloprafum*, great round. 24. 1657. Severn ifles. Per. 7.
2. A. *arenarium*, fand. 19. 1358. Mountain woods. Per. 7.
3. A. *carinatum*, mountain. 24. 1658. Rocks and mountains. Per. 7.
4. A. *oleraceum*, ftreaked field. 7. 488. Fields. Per. 7.
5. A. *vineale*, crow. 28. 1974. Chalky hills and fields. Per. 7.
6. A. *urfinum*, broad-leaved. 2. 122. Groves and thickets. Per. 5, 6.
7. A. *Schoenoprafum*, chive. 34. 2441. Meadows and paftures, rare. Per. 6.

FRITILLARIA. Fritillary.

1. F. *Meleagris*, common. 9. 622. Moift paftures. Per. 4.

TULIPA. Tulip.

1. T. *fylveftris*, wild yellow. 1. 63. Chalk-pits, rare. Per. 4.

ORNITHOGALUM. Star of Bethlehem.

1. O. *luteum*, yellow. 1. 21. Groves, rare. Per. 4.
2. O. *pyrenaicum*, fpiked. 7. 499. Paftures and hills, rare. Per. 6, 7.
3. O. *umbellatum*, common. 2. 130. Meadows and paftures. Per. 4, 5.
4. O. *nutans*, drooping. 28. 1997. Dry meadows, rare. Per. 5.

HYACINTHUS. Hyacinth.

1. H. *racemofus*, ftarch. 27. 1391. Sandy ground, and walks. Per. 5.

SCILLA. Squill.

1. S. *verna*, vernal. 1. 23. Sea cliffs. Per. 4.
2. S. *bifolia*, two-leaved. 1. 24. Woods in the weft. Per. 3, 4.
3. S. *autumnalis*, autumnal. 2. 78. Dry paftures, rare. Per. 9.
4. S. *nutans*, hare-bell. 6. 377. Groves and paftures. Per. 5.

ANTHERICUM. Spider-wort.

1. A. *ferotinum*, mountain. 12. 793. Welfh mountains. Per. 6.

NARTHECIUM. Afphodel.

1. N. *offifragum*, Lancafhire. 8. 535. Turfy bogs. Per. 7, 8.

ASPARAGUS. Sperage.

1. A. *officinalis*, common. 5. 339. Stony fea-coaft. Per. 8.

CONVALLARIA. Lilly of the Valley.

1. C. *majalis*, common. 15. 1035. Groves and thickets. Per. 5.
2. C. *verticillata*, narrow-leaved Solomon's feal. 2. 128. Woods, Scotland. Per. 6.
3. C. *Polygonatum*, angular Solomon's feal. 4. 280. Woods, rare. Per. 5, 6.
4. C. *multiflora*, common Solomon's feal. 4. 279. Woods. Per. 5, 6.

ACORUS. Sweet Flag.

1. A. *Calamus*, common. 5. 356. Watery places. Per. 6.

JUNCUS. Rufh.

1. J. *acutus*, great fharp. 23. 1614. Sandy fea-coaft. Per. 7.
2. J. *maritimus*, leffer fharp. 24. 1725. Muddy fea-coaft. Per. 8.
3. J. *glaucus*, hard. 10. 665. Moift paftures. Per. 7.
4. J. *conglomeratus*, common. 12. 835. Moift paftures. Per. 7.
5. J. *effufus*, foft. 12. 836. Moift paftures. Per. 7.
6. J. *filiformis*, leaft. 17. 1175. Alpine rills. Per. 8.
7. J. *trifidus*, three-leaved. 21. 1482. Alpine bogs. Per. 7.
8. J. *fquarrofus*, mofs. 13. 933. Sandy heaths. Per. 6, 7.
9. J. *acutiflorus*, fharp-flowered jointed. 4. 238, (articulatus). Bogs. Per. 6.

"Leaves with knotty joints, flightly compreffed. Stem without joints. Panicle repeatedly forked, denfe. Calyx-leaves all fharp-pointed."—*Stem* leafy. *Panicle* fpreading, with upright branches. *Flowers* fmall.

10. J. *lampocarpus*, fhining-fruited jointed. 30. 2143. Boggy ground. Per. 6, 7.

"Leaves with knotty joints, compreffed. Stem without joints. Panicle compound, erect, elongated. Inner calyx-leaves bluntifh, bordered. Capfule coloured, varnifhed."—*Stem* leafy. *Panicle* tall, many-flowered. *Capfule* large, of a dark chocolate hue, and highly polifhed.

11. J. *obtufiflorus*, blunt-flowered jointed. 30. 2144. Marfhes. Per. 7, 8.

"Leaves and ftem with knotty joints, cylindrical. Panicle repeatedly compound; its branches divaricated and reflexed. Calyx-leaves obtufe, as long as the capfule."—

 Stem

Stem tall, but with only two *leaves*. *Flowers* and *capſule* ſmall, browniſh.

12. J. *uliginoſus*, little bulbous. 12. 801. Wet ſandy heaths. Per. 6, 7.
13. J. *bulboſus*, round-fruited. 13. 934. Moiſt paſtures. Per. 7.
14. J. *gracilis*, ſlender ſpreading. 31. 2174. Alpine bogs, rare. Per. 7.

"Leaves linear, flat. Stem forked, racemoſe, taller than the leaves. Flowers ſolitary."

15. J. *bufonius*, toad. 12. 802. Sandy wet places. Ann. 7, 8.
16. J. *biglumis*, two-flowered. 13. 898. Alpine rills, rare. Per. 8.
17. J. *triglumis*, three-flowered. 13. 899. Alpine rills. Per. 7.
18. J. *caſtaneus*, cluſtered alpine. 13. 900. Highland bogs. Per. 7.
19. J. *piloſus*, broad-leaved hairy. 11. 736. Woods and groves. Per. 3, 4.
20. J. *Forſteri*, narrow-leaved hairy. 18. 1293. Groves. Per. 5.
21. J. *ſylvaticus*, wood. 11. 737. Woods and thickets. Per. 5.
22. J. *campeſtris*, hairy field. 10. 672. Barren paſtures. Per. 4, 5.
23. J. *ſpicatus*, ſpiked. 17. 1176. Highland hills. Per. 7.

BERBERIS. Barberry.

1. B. *vulgaris*, common. 1. 49. Chalky banks. Shrub. 5, 6.

FRANKENIA. Sea-Heath.

1. F. *lævis*, ſmooth. 3. 205. Muddy ſalt-marſhes. Per. 7.
2. F. *pulverulenta*, powdery. 31. 2222. Suſſex coaſt. Ann. 7.

PEPLIS. Water-Purſlane.

1. P. *Portula*, common. 17. 1211. Watery places. Ann. 7, 8.

Ord. 2. *Trigynia*.

RUMEX. Dock.

1. R. *ſanguineus*, bloody-veined. 22. 1533. Woods and way ſides. Per. 7.
2. R. *criſpus*, curled. 28. 1998. Rubbiſh and paſtures. Per. 6, 7.
3. R. *acutus*, ſharp. 11. 724. Watery and waſte places. Per. 7.
4. R. *obtuſifolius*, broad-leaved. 28. 1999. Waſte ground. Per. 7, 8.
5. R. *pulcher*, fiddle. 22. 1576. Gravelly paſtures. Per. 8.
6. R. *maritimus*, golden. 11. 725. Salt marſhes. Per. 7, 8.
7. R. *paluſtris*, yellow marſh. 27. 1932. Marſhes and ditches. Per. 7, 8.
8. R. *aquaticus*, great water. 30. 2104. Ditches and rivers. Per. 7, 8.
9. R. *digynus*, mountain ſorrel. 13. 910. Alpine rivulets. Per. 6.
10. R. *Acetoſa*, common ſorrel. 2. 127. Meadows and paſtures. Per. 6.
11. R. *Acetoſella*, ſheep's ſorrel. 24. 1674. Gravelly fields. Per. 6, 7.

TOFIELDIA. Tofieldia.

1. T. *paluſtris*, Scottiſh aſphodel. 8. 536. Alpine rills. Per. 8.

SCHEUCHZERIA. Scheuchzeria.

1. S. *paluſtris*, marſh. 26. 1801. Bogs, Yorkſhire. Per. 6.

TRIGLOCHIN. Arrow-graſs.

1. T. *paluſtre*, marſh. 6. 366. Marſhes. Per. 7.
2. T. *maritimum*, ſea. 4. 255. Muddy ſalt-marſhes. Per. 5—8.

COLCHICUM. Meadow-Saffron.

1. C. *autumnale*, common. 2. 133. β. 20. 1432. Rich meadows. Per. 9.

Ord. 3. *Polygynia*.

ALISMA. Water-Plantain.

1. A. *Plantago*, greater. 12. 837. Ditches and pools. Per. 7.
2. A. *Damaſonium*, ſtar-headed. 23. 1615. Gravelly pools, rare. Per. 6, 7.
3. A. *natans*, floating. 11. 775. Alpine lakes, rare, Per. 7, 8.
4. A. *ranunculoides*, ſmall. 5. 326. Watery turfy bogs, P. 8.

Claſs 7. HEPTANDRIA.

Ord. 1. *Monogynia*.

TRIENTALIS. Trientalis.

1. T. *europæa*, chickweed. 1. 15. Woods and mountain heaths. Per. 5, 6.

Claſs 8. OCTANDRIA.

Ord. 1. *Monogynia*.

OENOTHERA. Evening-Primroſe.

1. O. *biennis*, common. 22. 1534. Sandy weſtern coaſt. Bienn. 7—9.

EPILOBIUM. Willow-herb.

1. E. *anguſtifolium*, roſe-bay. 28. 1947. Shady meadows. Per. 7.
2. E. *hirſutum*, great hairy. 12. 838. Watery places, Per. 7.
3. E. *parviflorum*, ſmall-flowered, hoary. 12. 795. Watery places. Per. 7.
4. E. *montanum*, broad ſmooth-leaved. 17. 1177. Groves and ſtony places. Per. 7.
5. E. *roſeum*, pale ſmooth-leaved. 10. 693. Boggy ground, rare. Per. 7.
6. E. *tetragonum*, ſquare-ſtalked. 28. 1948. Marſhes. Per. 7.
7. E. *paluſtre*, round-ſtalked, marſh. 5. 346. Marſhes. Per. 7.
8. E. *alſinifolium*, chickweed-leaved. 28. 2000. Mountain rills. Per. 7.

"Leaves on footſtalks, ovate, acute, toothed. Stigma undivided. Root creeping, matted. Stems decumbent, obtuſely quadrangular."—Mr. Winch has ſhewn this to be the

the plant of the Cheviot hills, described by Ray, which has always been taken for *alpinum*.

9. E. *alpinum*, alpine. 28. 2001. Alpine rivulets, Scotland. Per. 6, 7.

CHLORA. Yellow-Centaury.

1. C. *perfoliata*, common. 1. 60. Chalky banks. Ann. 7, 8.

VACCINIUM. Whortle-berry.

1. V. *Myrtillus*, bilberry. 7. 456. Heaths and woods. Shrub. 5.
2. V. *uliginosum*, great bilberry. 9. 581. Marshy heaths. Shrub. 4, 5,
3. V. *Vitis Idæa*, red. 9. 598. Dry stony moors. Shrubby. 6.
4. V. *Oxycoccus*, cranberry. 5. 319. Mossy bogs. Per. 6.

MENZIESIA. Menziesia.

1. M. *cærulea*, Scottish. 35. 2469. West of Scotland. Shrubby. 6, 7.
2. M. *Dabeoci*, Irish. 1. 35. (Erica Dabeoci.) West of Ireland. Shrubby. 6, 7.

ERICA. Heath.

1. E. *vulgaris*, common. 15. 1013. Heaths and woods. Shrub. 6, 7.
2. E. *Tetralix*, cross-leaved. 15. 1014. Bogs. Shrubby. 7, 8.
3. E. *cinerea*, fine-leaved. 15. 1015. Heaths. Shrub. 7, 8.
4. E. *vagans*, Cornish. 1. 3. Heaths, Cornwall. Shrub. 7, 8.

DAPHNE. Mezereon.

1. D. *Mezereum*, spurge-olive. 20. 1381. Woods, rare. Shrub. 3, 4.
2. D. *Laureola*, spurge-laurel. 2. 119. Bushy places. Shrub. 3.

ACER. Maple.

*1. A. *Pseudo-platanus*, greater, or sycamore. 5. 303. Woods. Tree. 5.
2. A. *campestre*, common. 5. 304. Woods and hedges. Tree. 5, 6.

Ord. 2. *Trigynia.*

POLYGONUM. Persicaria.

1. P. *amphibium*, amphibious. 7. 436. Ponds and ditches. Per. 7, 8.
2. P. *Persicaria*, spotted. 11. 756. Ditches and bogs. Ann. 7, 8.
3. P. *lapathifolium*, pale-flowered. 20. 1382. Dunghills. Ann. 7, 8.
4. P. *Hydropiper*, biting. 14. 989. Watery places. Ann. 9.
5. P. *minus*, small creeping. 15. 1043. Gravelly puddles. Ann. 9.
6. P. *Bistorta*, great bistort. 8. 509. Meadows. Per. 6.
7. P. *viviparum*, alpine bistort. 10. 669. Highland mountains. Per. 6, 7.
8. P. *aviculare*, knot-grass. 18. 1252. Rubbish and sand. Ann. 4—10.

*9. P. *Fagopyrum*, buck-wheat. 15. 1044. Fields. Ann. 7, 8.

10. P. *Convolvulus*, black bindweed. 14. 941. Corn-fields. Ann. 6, 7.

Ord. 3. *Tetragynia.*

PARIS. Herb Paris.

1. P. *quadrifolia*, common. 1. 7. Shady groves. Per. 5.

ADOXA. Moschatell.

1. A. *Moschatellina*, tuberous. 7. 453. Groves and banks. Per. 4, 5.

ELATINE. Waterwort.

1. E. *Hydropiper*, small. 14. 955. Borders of lakes, rare. Ann. 8.

Class 9. ENNEANDRIA.

Ord. 1. *Hexagynia.*

BUTOMUS. Flowering-Rush.

1. B. *umbellatus*, common. 10. 651. Rivers and ditches. Per. 6, 7.

Class 10. DECANDRIA.

Ord. 1. *Monogynia.*

MONOTROPA. Bird's-nest.

1. M. *Hypopithys*, yellow. 1. 69. Beech or Fir woods. Per. 6.

ANDROMEDA. Andromeda.

1. A. *polifolia*, marsh. 10. 713. Turfy bogs. Shrubby. 6.

ARBUTUS. Arbutus.

1. A. *Unedo*, strawberry tree. 34. 2377. Rocks, Ireland. Shrub. 9.
2. A. *alpina*, black-berried alpine. 29. 2030. Stony hills, rare. Shrubby. 5.
3. A. *Uva ursi*, red-berried trailing. 10. 714. Alpine moors. Shrubby. 6.

PYROLA. Winter-green.

1. P. *rotundifolia*, round-leaved. 3. 213. Mountain thickets, rare. Per. 7.
2. P. *media*, intermediate. 28. 1945. North of England, woods. Per. 6.
3. P. *rosea*, rose-coloured. 36. 2543. North of England, woods. Per. 7.
4. P. *minor*, lesser. 3. 158? Woods, and mountain thickets. Per. 7.
5. P. *secunda*, serrated. 8. 517. Alpine woods. Per. 7.
6. P. *uniflora*, single-flowered. 3. 146. Alpine woods, rare. Per. 7.

Ord. 2. *Digynia.*

CHRYSOSPLENIUM. Golden-Saxifrage.

1. C. *alternifolium*, alternate-leaved. 1. 54. Shady rills, rare. Per. 5.
2. C. *oppositifolium*, opposite-leaved. 7. 490. Shady rills. Per. 5.

SAXIFRAGA. Saxifrage.

1. S. *ſtellaris*, hairy. 3. 167. Mountain rivulets. Per. 6, 7.
2. S. *nivalis*, cluſtered alpine. 7. 440. Tops of Highland mountains. Per. 7.
3. S. *umbroſa*, London pride. 10. 663. Mountains. Per. 6.
4. S. *hirſuta*, hairy oval-leaved. 33. 2322. Mountains, Ireland. Per. 6.
5. S. *Geum*, kidney-leaved. 22. 1561. Mountains, Ireland. Per. 6.
6. S. *oppoſitifolia*, purple. 1. 9. Alpine rocks. Per. 4.
7. S. *Hirculus*, yellow marſh. 15. 1009. Turfy bogs, very rare. Per. 8.
8. S. *aizoides*, yellow mountain. 1. 39. Mountain rivulets. Per. 7, 8.
9. S. *granulata*, white. 7. 500. Meadows and paſtures. Per. 5.
10. S. *cernua*, drooping bulbous. 10. 664. Weſt alpine rocks. Per. 7.
11. S. *rivularis*, alpine brook. 32. 2275. Alpine rivulets. Per. 6, 7.
12. S. *tridactylites*, rue-leaved. 7. 501. Walls. Ann. 5.
13. S. *cæſpitoſa*, tufted alpine. 12. 794. Alpine rocks, rare. Per. 6.
14. S. *moſchata*, muſky alpine. 33. 2314. Alpine rocks, rare. Per. 6, 7.
15. S. *palmata*, palmate. 7. 455. Rocky mountains. Per. 5, 6.
16. S. *hirta*, trifid hairy. 32. 2291. Highlands of Scotland. Per. 5, 6.
17. S. *platypetala*, broad-petalled. 32. 2276. Snowdon, and Scotland. Per. 6.
18. S. *elongella*, long-ſtalked. 32. 2277. Scottiſh mountains. Per. 6.
19. S. *hypnoides*, moſſy cuſhion. 7. 454. Mountains. Per. 5, 6.
20. S. *pedatifida*, pedatifid. 32. 2278. Highlands of Scotland. Per. 5, 6.

SCLERANTHUS. Knawel.

1. S. *annuus*, annual. 5. 351. Sandy fields, common. Ann. 7.
2. S. *perennis*, perennial. 5. 352. Sandy heaths, rare, Per. 10, 11.

SAPONARIA. Soapwort.

1. S. *officinalis*, common. 15. 1060. Meadows and hedges. Per. 8, 9.

DIANTHUS. Pink.

1. D. *Armeria*, Deptford. 5. 317. Gravelly paſtures. Ann. 7, 8.
2. D. *prolifer*, proliferous. 14. 956. Gravelly banks, rare. Ann. 7.
3. D. *Caryophyllus*, clove. 3. 214. Walls. Per. 7.
4. D. *deltoides*, maiden. 1. 61. Gravelly paſtures. Per. 7—10.
5. D. *cæſius*, mountain. 1. 62. Dry limeſtone rocks, rare. Per. 6, 7.

Ord. 3. *Trigynia.*

CUCUBALUS. Berry-Chickweed.

1. C. *baccifer*, black-fruited. 22. 1577. Angleſea, *Dillenius.* Per. 6, 7.

11

SILENE. Catchfly.

1. S. *anglica*, Engliſh. 17. 1178. Sandy fields. Ann. 7.
2. S. *quinquevulnera*, variegated. 2. 86. Sandy fields. Ann. 6, 7.
3. S. *nutans*, Nottingham. 7. 465. Calcareous rocks. Per. 6, 7.

S. *paradoxa*, mentioned in the Fl. Brit. 467, is to be excluded, as not really of Britiſh growth. The Dover Catchfly, *Lychnis major noctiflora Dubrenſis perennis*, Raii Syn. 340, has not been found ſince the time of Ray; and the old ſpecimens, preſerved in the Britiſh Muſeum, appear to be ſomething unknown to modern botaniſts, though not ſufficiently perfect to afford ſpecific characters. They are moſt like the Linnæan *Cucubalus viſcoſus*, for which Ray's plant was originally taken by Linnæus and Hudſon.

4. S. *inflata*, bladder. 3. 164. Fields and banks, common. Per. 7.
5. S. *maritima*, ſea. 14. 957. Stony ſhores and mountains. Per. 8, 9.
6. S. *Otites*, Spaniſh. 2. 85. Dry fields and heaths, rare. Per. 7, 8.
7. S. *conica*, corn. 13. 922. Sandy corn-fields. Ann. 7.
8. S. *noctiflora*, night-flowering. 5. 291. Gravelly fields. Ann. 7.

*9. S. *Armeria*, common, or Lobel's. 20. 1398. Fields and banks. Ann. 7, 8.

10. S. *acaulis*, moſs. 16. 1081. Mountains. Per. 6, 7.

STELLARIA. Stitchwort.

1. S. *nemorum*, wood. 2. 92. Moiſt woods, in the north. Per. 5, 6.
2. S. *media*, common chickweed. 8. 537. Waſte and cultivated ground. Ann. 4—10.
3. S. *holoſtea*, greater. 8. 511. Dry groves. Per. 5.
4. S. *graminea*, leſſer. 12. 803. Paſtures and buſhes. Per. 5.
5. S. *glauca*, glaucous marſh. 12. 825. Wet meadows. Per. 6, 7.
6. S. *uliginoſa*, bog. 15. 1075. Watery places. Ann. 6.
7. S. *ſcapigera*, many-ſtalked. 18. 1269. Rivulets, Scotland. Per. 6.
8. S. *ceraſtoides*, alpine. 13. 911. Highland mountains. Per. 6.

ARENARIA. Sandwort.

1. A. *peploides*, ſea. 3. 189. Sandy beach. Per. 6, 7.
2. A. *trinervis*, plantain-leaved. 21. 1483. Groves. Ann. 5, 6.
3. A. *ſerpyllifolia*, thyme-leaved. 13. 923. Banks and walls. Ann. 6, 7.
4. A. *rubra*, purple. 12. 852. Sandy fields. Ann. 7, 8.
5. A. *marina*, ſea ſpurrey. 14. 958. Sandy beach. Ann. 6, 7.
6. A. *tenuifolia*, fine-leaved. 4. 219. Sand and walls. Ann. 6.
7. A. *verna*, vernal. 8. 512. Sparry hills. Per. 5–8.
8. A. *faſtigiata*, level-topped. 25. 1744. Scottiſh mountains. Ann. 6.
9. A. *ciliata*, fringed. 25. 1745. Iriſh mountains. Per. 8.

CHERLERIA. Cherleria.

1. C. *ſedoides*, dwarf. 17. 1212. Highland mountains. Per. 7.

Ord.

Ord. 4. *Pentagynia.*

COTYLEDON. Navelwort.

1. C. *Umbilicus*, common. 5. 325. Shady rocks. Per. 6, 7.
2. C. *lutea*, greater yellow. 22. 1522. Moiſt rocks and walls, rare. Per. 6.

SEDUM. Stone-crop.

1. S. *Telephium*, orpine. 19. 1319. Fields and thickets. Per. 8.
2. S. *daſyphyllum*, thick-leaved. 10. 656. Walls and ſtones. Per. 6.
3. S. *anglicum*, Engliſh. 3. 171. Mountains, and ſea ſhore. Ann. 7.
4. S. *acre*, biting. 12. 839. Walls and dry ſand. Per. 6.
5. S. *ſexangulare*, inſipid. 28. 1946. Walls, rare. Per. 6, 7.
6. S. *villoſum*, hairy. 6. 394. Mountain rills. Per. 6, 7.
7. S. *album*, white. 22. 1578. Rocks and walls, rare. Per. 7.
8. S. *reflexum*, yellow. 10. 695. Walls and roofs, common. Per. 7.
9. S. *glaucum*, glaucous. 35. 2477. Barren ſands. Per. 7, 8.
10. S. *rupeſtre*, rock. 3. 170. Rocks, rare. Per. 7.
11. S. *Forſterianum*, Forſterian. 26. 1802. Rocks, Wales. Per. 7.

OXALIS. Wood-Sorrel.

1. O. *Acetoſella*, common. 11. 762. Woods. Per. 4, 5.
2. O. *corniculata*, yellow procumbent. 24. 1726. Shady rocks. Per. 5—10.

AGROSTEMMA. Cockle.

1. A. *Githago*, corn. 11. 741. Corn-fields. Ann. 6, 7.

LYCHNIS. Campion.

1. L. *Flos cuculi*, ragged robin. 8. 573. Moiſt meadows. Per. 6.
2. L. *Viſcaria*, German catchfly. 11. 788. Rocks; rare. Per. 5, 6.
3. L. *alpina*, red alpine. 32. 2254. Highland rocks. Per. 6, 7.
4. L. *dioica*, red or white. 22. 1579, 1580. Groves, and fields. Per. 5—9.

CERASTIUM. Chickweed.

1. C. *vulgatum*, broad mouſe-ear. 11. 789. Paſtures and rubbiſh. Ann. 4, 5.
2. C. *viſcoſum*, narrow mouſe-ear. 11. 790. Paſtures and rubbiſh. Per. 5—9.
3. C. *ſemidecandrum*, little mouſe-ear. 23. 1630. Walls and ſand. Ann. 4, 5.
4. C. *tetrandrum*, tetrandrous mouſe-ear. 3. 166. Rocks and ſand, Scotland. Ann. 5, 6.
5. C. *arvenſe*, field. 2. 93. Gravelly fields. Per. 5—8.
6. C. *alpinum*, alpine. 7. 472. Alpine rills. Per. 6, 7.
7. C. *latifolium*, broad rough. 7. 473. Alpine rocks. Per. 6.
8. C. *aquaticum*, water. 8. 538. Watery places. Per. 7.

SPERGULA. Spurrey.

1. S. *arvenſis*, rough-ſeeded corn. 22. 1535. Sandy fields. Ann. 7, 8.
2. S. *pentandra*, ſmooth-ſeeded corn. 22. 1536. Sandy fields. Ann. 7, 8.
3. S. *nodoſa*, knotted. 10. 694. Moiſt ſandy heaths. Per. 7, 8.
4. S. *ſaginoides*, ſmooth awl-ſhaped. 30. 2105. Highland mountains. Per. 6.
5. S. *ſubulata*, ciliated awl-ſhaped. 16. 1082. Sandy heaths. Per. 7, 8.

Claſs 11. DODECANDRIA.

Ord. 1. *Monogynia.*

ASARUM. Aſarabacca.

1. A. *europæum*, common. 16. 1083. Woods, rare. Per. 5.

LYTHRUM. Lythrum.

1. L. *Salicaria*, purple. 15. 1061. Watery places. Per. 7, 8.
2. L. *hyſſopifolia*, hyſſop-leaved. 5. 292. Inundated ground. Ann. 8.

Ord. 2. *Digynia.*

AGRIMONIA. Agrimony.

1. A. *Eupatoria*, common. 19. 1335. Thickets and hedges. Per. 6, 7.

Ord. 3. *Trigynia.*

RESEDA. Mignonette.

1. R. *Luteola*, dyer's-weed. 5. 320. Fields and rubbiſh. Ann. 7.
2. R. *lutea*, wild, or baſe rocket. 5. 321. Fields and chalky hills. Ann? 7, 8.

EUPHORBIA. Spurge.

1. E. *Peplis*, purple. 28. 2002. Sandy ſouth coaſt. Ann. 7, 8.
2. E. *Peplus*, petty. 14. 959. Cultivated ground, common. Ann. 7, 8.
3. E. *exigua*, dwarf. 19. 1336. Corn-fields, rare. Ann. 7.

†4. E. *Lathyris*, caper. 32. 2255. Dry ſtony places, rare. Bienn. 5, 6.

5. E. *Portlandica*, Portland. 7. 441. South coaſt. Per. 8.
6. E. *paralia*, ſea. 3. 195. Sandy ſea ſhore. Per. 8, 9.
7. E. *helioſcopia*, ſun. 13. 883. Cultivated ground. Ann. 7, 8.
8. E. *platyphylla*, warty. 5. 333. Corn-fields, rare. Ann. 7, 8.
9. E. *Eſula*, leafy-branched. 20. 1399. Woods, Scotland. Per. 7.
10. E. *Cypariſſias*, cypreſs. 12. 840. Woods and barren ground. Per. 5, 6.
11. E. *hiberna*, Iriſh. 19. 1337. Fields, rare. Per. 6.
12. E. *amygdaloides*, wood. 4. 256. Woods and groves. Per. 3, 4.
13. E. *Characias*, red. 7. 442. Mountainous places, rare. Shrub. 3, 4.

Ord. 4. *Dodecagynia.*

SEMPERVIVUM. Houſeleek.

1. S. *tectorum*, common. 19. 1320. Roofs and walls. Per. 7.

Clafs 12. Icosandria.

Ord. 1. *Monogynia.*

Prunus. Cherry or Plum.

1. P. *Padus*, bird cherry. 20. 1383. Woods and hedges. Tree. 5.
2. P. *Cerafus*, common cherry. 10. 706. Woods and hedges. Tree. 5.
*3. P. *domeftica*, common plum. 25. 1783. Hedges. Tree. 4.
4. P. *infititia*, bullace. 12. 841. Hedges and groves. Tree. 4.
5. P. *fpinofa*, floe. 12. 842. Hedges and thickets. Shrub. 3, 4.

Ord. 2. *Pentagynia.*

Mespilus. Medlar.

1. M. *Oxyacantha*, hawthorn. 35. 2504. Hedges and thickets. Small tree. 5, 6.
*2. M. *germanica*, common eatable. 22. 1523. Hedges, rare. Tree. 5.

Pyrus. Pear.

1. P. *communis*, common. 25. 1784. Woods and hedges. Tree. 4.
2. P. *Malus*, apple, or crab. 3. 179. Woods and hedges. Tree. 5.
3. P. *torminalis*, wild fervice. 5. 298. Woods and hedges. Tree. 4, 5.
4. P. *domeftica*, true fervice. 5. 350. Mountain woods, rare. Tree. 5.
5. P. *aucuparia*, mountain afh. 5. 337. Mountain woods. Tree. 5.
6. P. *pinnatifida*, baftard mountain afh. 33. 2331. Rocks, rare. Tree. 5.
7. P. *Aria*, white beam-tree. 26. 1858. Limeftone rocks. Tree. 5.

Spiræa. Spiræa.

1. S. *falicifolia*, willow-leaved. 21. 1468. Wet mountain thickets. Shrub. 7.
2. S. *Filipendula*, dropwort. 4. 284. Dry open paftures. Per. 7.
3. S. *Ulmaria*, meadow-fweet. 14. 960. Moift meadows. Per. 6. 7.

Ord. 2. *Polygynia.*

Rosa. Rofe.

1. R. *fpinofiffima*, burnet. 3. 187. Sandy heaths. Low fhrub. 7.
2. R. *rubella*, red-fruited dwarf. 36. 2521. Northumberland. Low fhrub. 7.
3. R. *involuta*, prickly unexpanded. 29. 2068. Weftern ifles. Low fhrub. 6.
4. R. *hibernica*, Irifh. 31. 2196. Ireland. Shrub. 6—11.
5. R. *arvenfis*, white field. 3. 188. Hedges and thickets. Shrub. 6, 7.
6. R. *villofa*, apple. 9. 583. Mountain thickets. Shrub. 6.
7. R. *mollis*, foft-leaved round-fruited. 35. 2459. Thickets. Low fhrub. 6.
8. R. *cinnamomea*, cinnamon. 34. 2388. Thickets, Yorkfhire. Shrub. 5.
9. R. *tomentofa*, dowys-leaved briar. 14. 990. Woods and hedges. Shrub. 6, 7.
10. R. *rubiginofa*, fweet briar. 14. 991. Gravelly heaths. Shrub. 6, 7.
11. R. *micrantha*, fmall-flowered fweet briar. 35. 2490. Hedges. Shrub. 6, 7.
12. R. *fcabriufcula*, roughifh-leaved briar. 27. 1896. Hedges. Shrub. 6.
13. R. *cæfia*, glaucous-leaved. 33. 2367. Highland valleys. Shrub. 7.
14. R. *canina*, common dog-briar. 14. 992. Hedges. Shrub. 6.
15. R. *collina*, rough-ftalked dog-briar. 27. 1895. Thickets, Suffex. 7.
16. R. *dumetorum*, downy-ftalked dog-briar. 36. 2579. Thickets, Suffex. 7.

Rubus. Bramble.

1. R. *idæus*, rafpberry. 34. 2442. Woods and thickets. Shrub. 5, 6.
2. R. *fuberectus*, red-fruited. 36. 2572. Northern woods. Shrub. 6.
3. R. *cæfius*, dew-berry. 12. 826. Groves and hedges. Shrub. 6, 7.
4. R. *corylifolius*, hazel-leaved. 12. 827. Hedges. Shrub. 7.
5. R. *fruticofus*, common. 10. 715. Hedges. Shrub. 7, 8.
6. R. *faxatilis*, ftone. 32. 2233. Mountain woods. Per. 6.
7. R. *arcticus*, dwarf crimfon. 23. 1585. Stony hills, rare. Per. 5, 6.
8. R. *Chamæmorus*, cloud-berry. 10. 716. Mountain moors. Per. 6.

Fragaria. Strawberry.

1. F. *vefca*, common. 22. 1524. Groves and banks. Per. 5, 6.
2. F. *elatior*, hautboy. 31. 2197. Woods in the fouth, rare. Per. 6, 9.
3. F. *fterilis*, barren. 25. 1785. Barren paftures. Per. 3, 4.

Potentilla. Cinquefoil.

1. P. *fruticofa*, fhrubby. 2. 88. Mountain thickets, Yorkfhire. Shrub. 6.
2. P. *anferina*, filver-weed. 12. 861. Boggy meadows. Per. 6, 7.
3. P. *rupeftris*, ftrawberry-flowered. 29. 2058. Rocks, Wales. Per. 6, 7.
4. P. *argentea*, hoary. 2. 89. Gravelly paftures. Per. 6.
5. P. *aurea*, golden. 8. 561. Highland mountains. Per. 7.
6. P. *verna*, fpring. 1. 37. High open paftures. Per. 4, 5.
7. P. *opaca*, faw-leaved hairy. 35. 2449. Highlands. Per. 6.
8. P. *alba*, white. 20. 1384. Welch mountains. Per. 7, 8.
9. P. *reptans*, common creeping. 12. 862. Meadows and paftures. Per. 6—8.
10. P. *tridentata*, trifid-leaved. 34. 2389. Highlands. Per. 5, 6.

Tormentilla. Tormentil.

1. T. *officinalis*, common. 12. 863. Heaths and paftures. Per. 6, 7.
2. T. *reptans*, trailing. 12. 864. Hedges, rare. Per. 6, 7.

Geum.

GEUM. Avens.

1. G. *urbanum*, common. 20. 1400. Woods and hedges. Per. 5—8.
2. G. *rivale*, water. 2. 106. Moift fhady meadows. Per. 6, 7.

DRYAS. Mountain-avens.

1. D. *octopetala*, white. 7. 451. Alpine moors. Per. 7, 8.

COMARUM. Marfh-cinquefoil.

1. C. *paluftre*, common. 3. 172. Spongy bogs. Per. 6, 7.

Clafs 13. POLYANDRIA.

Ord. 1. *Monogynia.*

ACTÆA. Bane-berries.

1. A. *fpicata*, herb chriftopher. 13. 918. Mountain groves, rare. Per. 5, 6.

CHELIDONIUM. Celandine.

1. C. *majus*, common. 22. 1581. Shady banks. Per. 5, 6.

GLAUCIUM. Horned-poppy.

1. G. *luteum*, yellow. 1. 8. Sandy fea-coaft. Per. 7, 8.
†2. G. *phoeniceum*, fcarlet. 20. 1433. Sandy fields. Ann. 6, 7.
3. G. *violaceum*, violet. 3. 201. Chalky fields, rare. Ann. 5, 6.

PAPAVER. Poppy.

1. P. *hybridum*, mongrel. 1. 43. Chalky fields, rare. Ann. 7.
2. P. *Argemone*, long-rough-headed. 9. 643. Corn-fields. Ann. 6, 7.
3. P. *dubium*, long-fmooth-headed. 9. 644. Sandy fields. Ann. 6—8.
4. P. *Rhoeas*, common red. 9. 645. Corn-fields. Ann. 6, 7.
5. P. *fomniferum*, white. 30. 2145. Sandy fen-banks. Ann. 7.
6. P. *cambricum*, yellow. 1. 66. Shady rocks. Per. 6.

NYMPHÆA. Water-lily.

1. N. *alba*, white. 3. 160. Pools, rivers and lakes. Per. 7.

NUPHAR. Yellow water-lily.

1. N. *lutea*, common. 3. 159. Pools and rivers. Per. 7.
2. N. *minima*, leaft, 32. 2292. Alpine lakes. Per. 7.

TILIA. Lime-tree.

1. T. *europæa*, common. 9. 610. Woods and hedges. Tree. 7.
2. T. *parvifolia*, fmall-leaved. 24. 1705. Woods. Tree. 8.

CISTUS. Ciftus.

1. C. *marifolius*, hoary dwarf. 6. 396. Rocks, rare. Dwarf fhrub. 5, 6.
2. C. *guttatus*, fpotted-flowered. 8. 544. Sandy paftures, rare. Ann. 6, 7.
3. C. *ledifolius*, ledum-leaved. 34. 2414. Sandy paftures, rare. Ann. 6, 7.
4. C. *furrejanus*, dotted-leaved. 31. 2207. Chalk hills, rare. Shrub. 7, 8.
5. C. *Helianthemum*, common dwarf. 19. 1321. Gravelly banks. Shrub. 7, 8.
6. C. *tomentofus*, downy. 31. 2208. Highland hills. Shrubby 7.
7. C. *polifolius*, white mountain. 19. 1322. Open downs. rare. Shrubby 6, 7.

Ord. 2. *Pentagynia.*

PÆONIA. Pæony.

1. P. *corallina*, entire-leaved. 22. 1513. Severn ifles. Per. 5, 6.

DELPHINIUM. Larkfpur.

1. D. *Confolida*, field. 26. 1839. Sandy fields. Ann. 6, 7.

AQUILEGIA. Columbine.

1. A. *vulgaris*, common. 5. 297. Meadows and paftures Per. 7.

STRATIOTES. Water-aloe.

1. S. *aloides*, common. 6. 379. Ditches and pools. Per. 7.

Ord. 3. *Polygynia.*

ANEMONE. Anemone.

1. A. *Pulfatilla*, pafque-flower. 1. 51. Chalky hills. Per. 4, 5.
2. A. *nemorofa*, common wood. 5. 355. Groves and heaths. Per. 4, 5.
3. A. *apennina*, blue mountain. 15. 1062. Groves, rare. Per. 4.
4. A. *ranunculoides*, yellow wood. 21. 1484. Groves, rare. Per. 4.

CLEMATIS. Traveller's joy.

1. C. *Vitalba*, common. 9. 612. Hedges, chalky foil. Shrub. 7.

THALICTRUM. Meadow-rue.

1. T. *alpinum*, alpine. 4. 262. Alpine bogs. Per. 6.
2. T. *minus*, leffer. 1. 11. Calcareous paftures. Per. 6, 7.
3. T. *majus*, greater. 9. 611. Mountain thickets. Per. 6, 7.
4. T. *flavum*, common. 6. 367. Moift meadows. Per. 7.

ADONIS. Pheafant's-eye.

1. A. *autumnalis*, corn. 5. 308. Corn-fields. Ann. 5—10.

RANUNCULUS. Crowfoot.

1. R. *Flammula*, leffer fpear-wort. 6. 387. Watery places. Per. 6—9.
2. R. *Lingua*, great fpear-wort. 2. 100. Ditches. Per. 7.
3. R. *gramineus*, graffy. 33. 2306. Alpine meadows. Per. 5, 6.
4. R. *Ficaria*, pile-wort. 9. 584. Groves and banks. Per. 4.
5. R. *auricomus*, wood. 9. 624. Dry groves. Per. 4, 5.
6. R. *fceleratus*, water. 10. 681. Watery places. Ann. 6—8.
7. R. *alpeftris*, alpine white. 34. 2390. Alpine rills. Per. 5.
8. R. *bulbofus*, bulbous. 8. 515. Meadows and paftures. Per. 5.
9. R. *hirfutus*, pale hairy. 21. 1504. Wafte and cultivated ground. Ann. 6—10.

R. *parvulus* of Linnæus, and Fl. Brit. 593, found below Briftol hot-wells by Mr. Dyer, and by feveral botanifts at Montpellier, proves a ftarved variety of our *hirfutus*, a

5 fpecies

ſpecies unnoticed by Linnæus. Mr. Curtis, in deſcribing the latter, had not adverted to the tuberculated ſeeds, by which it, in all its varieties, is readily and eſſentially diſtinguiſhed from *bulboſus*.

10. R. *repens*, creeping. 8. 516. Meadows and rubbiſh. Per. 6—8.
11. R. *acris*, upright meadow. 10. 652. Meadows and paſtures. Per. 6, 7.
12. R. *arvenſis*, corn. 2. 135. Corn-fields. Ann. 6.
13. R. *parviflorus*, ſmall-flowered. 2. 120. Gravelly fields. Ann. 5, 6.
14. R. *hederaceus*, ivy-leaved. 28. 2003. Inundated places. Per. 5—8.
15. R. *aquatilis*, white floating. 2. 101. Ditches, pools, and rivers. Per. 5, 6.

Trollius. Globe-flower.

1. T. *europæus*, common. 1. 28. Mountain groves. Per. 5, 6.

Helleborus. Hellebore.

1. H. *viridis*, green. 3. 200. Chalky woods, rare. Per. 4.
2. H. *fœtidus*, ſtinking. 9. 613. Chalky banks. Per. 3, 4.

Caltha. Marſh-marigold.

1. C. *paluſtris*, common. 8. 506. Wet meadows. Per. 5.
2. C. *radicans*, creeping. 31. 2175. Bogs, Scotland. Per. 6.

Claſs 14. Didynamia.

Ord. 1. *Gymnoſpermia.*

Ajuga. Bugle.

1. A. *reptans*, common. 7. 489. Moiſt groves. Per. 5.
2. A. *alpina*, alpine. 7. 477. Mountains. Per. 7.
3. A. *pyramidalis*, pyramidal. 18. 1270. Highland hills. Per. 5, 6.
4. A. *Chamæpitys*, ground pine. 2. 77. Sandy fields. Ann. 4, 5.

Teucrium. Germander.

1. T. *Scorodonia*, wood. 22. 1543. Woods and heaths. Per. 7.
2. T. *Scordium*, water. 12. 828. Boggy meadows, rare. Per. 7, 8.
3. T. *Chamædrys*, wall. 10. 680. Old walls. Per. 7.

Nepeta. Cat-mint.

1. N. *cataria*, common. 2. 137. Chalky banks. Per. 7.

Verbena. Vervain.

1. V. *officinalis*, common. 11. 767. Paſtures and rubbiſh. Per. 7.

Mentha. Mint.

1. M. *ſylveſtris*, horſe. 10. 686. Moiſt waſte ground. Per. 8, 9.
2. M. *rotundifolia*, round-leaved. 7. 446. Moiſt ground, rare. Per. 8, 9.
3. M. *viridis*, ſpear. 34. 2424. Wet meadows. Per. 8.
4. M. *piperita*, pepper. 10. 687. Watery places. Per. 8, 9.
5. M. *odorata*, bergamot. 15. 1025. Wet ground, rare. Per. 7, 8.
6. M. *hirſuta*, hairy. 7. 447, 448, (ſativa). Watery places. Per. 8, 9.
7. M. *acutifolia*, fragrant ſharp-leaved. 34. 2415. River banks, rare. Per. 9.
8. M. *rubra*, tall red. 20. 1413. Wet hedges. Per. 9.
9. M. *gentilis*, buſhy red. 30. 2118. Wet waſte ground, rare. Per. 8.
10. M. *gracilis*, narrow-leaved. 7. 449, (gentilis). Waſte ground. Per. 8.
11. M. *arvenſis*, corn. 30. 2119. Wet corn-fields. Per. 6—9.
12. M. *agretis*, rugged field. 30. 2120. Fields. Per. 8.
13. M. *Pulegium*, penny-royal. 15. 1026. Watery paſtures. Per. 9.

Glechoma. Ground-ivy.

1. G. *hederacea*, common. 12. 853. Woods and hedges. Per. 4. 5.

Lamium. Dead-nettle.

1. L. *album*, white. 11. 768. Waſte ground. Per. 5—9.
2. L. *maculatum*, ſpotted. 36. 2550. Banks, rare. Per. 4.
3. L. *purpureum*, red. 11. 769. Waſte and cultivated ground. Ann. 5—9.
4. L. *inciſum*, cut-leaved. 27. 1933. Sandy fields. Ann. 5.
5. L. *amplexicaule*, henbit. 11. 770. Sandy fields. Ann. 2—6.

Galeopsis. Hemp-nettle.

1. G. *Ladanum*, red. 13. 884. Chalky fields. Ann. 8, 9.
2. G. *villoſa*, downy. 33. 2353. Sandy fields, rare. Ann. 7, 8.
3. G. *Tetrahit*, common. 3. 207. Corn-fields. Ann. 7, 8.
4. G. *verſicolor*, large-flowered. 10. 667. Sandy fields. Ann. 7, 8.

Galeobdolon. Weaſel-ſnout.

1. G. *luteum*, yellow. 11. 787. Moiſt groves. Per. 5.

Betonica. Betony.

1. B. *officinalis*, wood. 16. 1142. Woods and thickets. Per. 7, 8.

Stachys. Wound-wort.

1. S. *ſylvatica*, hedge. 6. 416. Hedges and groves. Per. 7, 8.
2. S. *ambigua*, ambiguous. 30. 2089. North of Scotland. Per. 9.
3. S. *paluſtris*, marſh. 24. 1675. Wet meadows. Per. 8.
4. S. *germanica*, downy. 12. 829. Chalky fields. Per. 7.
5. S. *arvenſis*, corn. 17. 1154. Gravelly fields. Ann. 7, 8.

Ballota. Black-horehound.

1. B. *nigra*, ſtinking. 1. 46. Hedges and rubbiſh. Per. 7, 8.

Marrubium. White-horehound.

1. M. *vulgare*, aromatic. 6. 410. Dry waſte ground. Per. 7.

Leonurus. Motherwort.

1. L. *Cardiaca*, common. 4. 286. Gravelly banks. Per. 7, 8.

Clinopodium. Baſil.

1. C. *vulgare*, wild. 20. 1401. Gravelly or chalky banks. Per. 8.

Origanum

ORIGANUM. Marjoram.

1. O. *vulgare*, common. 16. 1143. Calcareous thickets. Per. 7, 8.

THYMUS. Thyme.

1. T. *Serpyllum*, wild. 22. 1514. Heaths and hills. Per. 7, 8.
2. T. *Acinos*, bafil. 6. 411. Sandy fields. Ann. 7. 8.
3. T. *Calamintha*, common calamint. 24. 1676. Gravelly banks. Per. 7, 8.
4. T. *Nepeta*, leffer calamint. 20. 1414. Chalky banks. Per. 8.

MELITTIS. Baftard-balm.

1. M. *Meliffophyllum*, reddifh. 9. 577. Woods, weft of England. Per. 5, 6.
2. M. *grandiflora*, purple and white. 9. 636. Woods, weft of England. Per. 5.

SCUTELLARIA. Scull-cap.

1. S. *galericulata*, common. 8. 523. Watery places. Per. 7, 8.
2. S. *minor*, leffer. 8. 524. Wet gravelly heaths. Per. 8.

PRUNELLA. Self-heal.

1. P. *vulgaris*, common. 14. 961. Meadows and paftures. Per. 7, 8.

Ord. 2. *Angiofpermia.*

BARTSIA. Bartfia.

1. B. *alpina*, alpine purple. 6. 361. Alpine rills. Per. 7.
2. B. *vifcofa*, yellow vifcid. 15. 1045. Marfhes, rare. Ann. 7, 8.
3. B. *Odontites*, red. 20. 1415. Meadows and paftures. Ann. 7, 8.

RHINANTHUS. Yellow-rattle.

1. R. *Crifta-galli*, common. 10. 657. Meadows. Ann. 6.

EUPHRASIA. Eye-bright.

1. E. *officinalis*, common. 20. 1416. Heaths and paftures. Ann. 7—9.

MELAMPYRUM. Cow-wheat.

1. M. *criftatum*, crefted. 1. 41. Fields and groves, rare. Ann. 7.
2. M. *arvenfe*, purple. 1. 53. Wheat fields, Norfolk. Ann. 7.
3. M. *pratenfe*, common. 2. 113. Groves and thickets. Ann. 7, 8.
4. M. *fylvaticum*, wood. 12. 804. Alpine woods. Ann. 7, 8.

LATHRÆA. Tooth-wort.

1. L. *Squamaria*, greater. 1. 50. Dry woods. Per. 4.

PEDICULARIS. Loufe-wort.

1. P. *paluftris*, marfh. 6. 399. Marfhy meadows. Per. 6, 7.
2. P. *fylvatica*, pafture. 6. 400. Mountain heaths. Per. 6, 7.

ANTIRRHINUM. Snapdragon.

*1. A. *Cymbalaria*, ivy-leaved. 7. 502. Old walls. Per. 5—11.

2. A. *fpurium*, round-leaved fluellin. 10. 691. Fields. Ann. 7—9.

3. A. *Elatine*, fharp-pointed fluellin. 10. 692. Fields. Ann. 7—9.

4. A. *repens*, creeping pale-blue toadflax. 18. 1253. Chalky hills. Per. 7—9.

5. A. *Linaria*, common yellow toadflax. 10. 658. Hedges, &c. Per. 6, 7.
   β, with regular pentandrous flowers. 4. 260. See PELORIA.

6. A. *minus*, leaft. 28. 2014. Sandy fields. Ann. 6—8.

*7. A. *majus*, great. 2. 129. Old walls. Per. 7, 8.

8. A. *Orontium*, leffer. 17. 1155. Sandy or chalky fields. Ann. 7, 8.

SCROPHULARIA. Figwort.

1. S. *nodofa*, knotty-rooted. 22. 1544. Woods and hedges. Per. 7.
2. S. *aquatica*, water. 12. 854. Watery places. Per. 7.
3. S. *Scorodonia*, balm-leaved. 31. 2209. Wet hedges, rare. Per. 7, 8.
4. S. *vernalis*, yellow. 8. 567. Lanes and hedges, rare. Bienn. 4, 5.

DIGITALIS. Fox-glove.

1. D. *purpurea*, purple. 19. 1297. Paftures and thickets. Bienn. 6, 7.

LINNÆA. Linnæa.

1. L. *borealis*, two-flowered. 7. 433. Stony woods, Scotland, rare. Per. 6.

SIBTHORPIA. Sibthorpia.

1. S. *europæa*, Cornifh moneywort. 10. 649. Moift ground, Cornwall. Per. 7, 8.

LIMOSELLA. Mud-wort.

1. L. *aquatica*, little. 5. 357. Muddy ground. Ann. 7, 8.

OROBANCHE. Broom-rape.

1. O. *major*, greater. 6. 421. On broom or furze. Per. 6, 7.
2. O. *elatior*, tall. 8. 568. On various roots. Per. 7, 8.
3. O. *minor*, leffer. 6. 422. On clover roots. Ann? 7, 8.
4. O. *rubra*, red fragrant. 25. 1786. Bafaltic rocks, Ireland. Per. 8.
5. O. *cærulea*, purple. 6. 423. Paftures near the fea. Per. 7.
6. O. *ramofa*, branched. 3. 184. On hemp. Ann. 8, 9.

Clafs 15. TETRADYNAMIA.

Ord. 1. *Siliculofa.*

VELLA. Crefs-rocket.

1. V. *annua*, annual. 21. 1442. Sandy fields, rare. Ann. 6.

SUBULARIA. Awl-wort.

1. S. *aquatica*, water. 11. 732. In alpine lakes. Ann. 7.

DRABA. Whitlow-grafs.

1. D. *verna*, common. 9. 586. Walls and paftures. Ann. 3, 4.
2. D. *aizoides*, yellow alpine. 18. 1271. Rocks, South Wales. Per. 3.
3. D. *hirta*, fimple-haired. 19. 1338. Alpine rocks. Per. 5, 6.

4. D.

4. D. *incana*, twifted-podded. 6. 388. Limeftone rocks. Bienn. 5, 6.
5. D. *muralis*, fpeedwell-leaved. 13. 912. Shady hills. Ann. 5.

ALYSSUM. Alyffum.

*1. A. *fativum*, gold of pleafure. 18. 1254. Fields. Ann. 6.
2. A. *maritimum*, fweet. 25. 1729. Sea-coaft, rare. Per. 8, 9.

LEPIDIUM. Pepper-wort.

1. L. *latifolium*, broad-leaved. 3. 182. Sea-coaft. Per. 7.
2. L. *ruderale*, narrow-leaved. 23. 1595. Sea-coaft. Bienn. 6.
3. L. *campeftre*, mithridate. 20. 1385. (Thlafpi). Fields, Ann. 7.
4. L. *hirtum*, hairy. 26. 1803. (Thlafpi). Fields, rare. Per. 6.

HUTCHINSIA. Hutchinfia.

Brown in Ait. Hort. Kew. v. 4. 82.

Eff. Ch. Pouch entire; valves tumid. Seeds two in each cell. Filaments fimple.

1. H. *petræa*, rock. 2. 111. (Lepidium petræum). Limeftone. Bienn. 3, 4.

Leaves pinnatifid, entire. Petals fhorter than the calyx. Stigma feffile.

Named, by Mr. R. Brown, in honour of Mifs Hutchins, of Bantry, in Ireland; a lady whofe difcoveries in the moft difficult parts of practical botany, well entitle her to commemoration. The genus is diftinguifhed from *Draba* and *Subularia*, in having but two, inftead of many, feeds in each cell; and moreover from the former in having tumid, not nearly flat valves; from the latter in not having linear cotyledons. *Lepidium* has properly an emarginate pouch, with keeled valves, and folitary feeds. Other fpecies of *Hutchinfia* are *Iberis rotundifolia* and *Lepidium alpinum* of Linnæus.

TEESDALIA. Teefdalia.

Brown in Ait. Hort. Kew. v. 4. 83.

Eff. Ch. Pouch emarginate, inverfely heart-fhaped. Seeds two in each cell. Filaments each bearing a fcale, at the infide, near the bafe.

1. T. *nudicaulis*, naked-ftalked. 5. 327. (Iberis nudicaulis). Gravelly paftures. Ann. 5.

Petals equal.

This genus is dedicated, by Mr. Brown, to the memory of the late Mr. Robert Teefdale, F.L.S. Another fpecies is the exotic *Lepidium nudicaule* of Linnæus, differing in having equal petals, and but four ftamens. See TEESDALIA hereafter in its proper place.

THLAPSI. Mithridate Muftard.

1. T. *arvenfe*, penny crefs. 24. 1659. Fields, rare. Ann. 6, 7.
2. T. *perfoliatum*, perfoliate. 33. 2354. Limeftone quarries. Ann. 4, 5.
3. T. *alpeftre*, alpine. 2. 81. Limeftone hills. Per. 6. 7.
4. T. *Burfa-paftoris*, fhepherd's purfe. 21. 1485. Common. Ann. 3—9.

COCHLEARIA. Scurvy-grafs.

1. C. *officinalis*, common. 8. 551. Mountains, and fea-coaft. Ann. 5.
2. C. *groenlandica*, Greenland. 34. 2403. Highlands. Ann. 8
3. C. *anglica*, Englifh. 8. 552. Muddy fea fhores. Ann. 5.
4. C. *danica*, Danifh. 10. 696. Muddy fhores, rare. Ann. 5, 6.
5. C. *Armoracia*, horfe-radifh. 33. 2323. Watery places. Per. 5.

CORONOPUS. Wart-crefs.

1. C. *Ruellii*, common. 24. 1660. Wafte ground. Ann. 6—8.
2. C. *didyma*, leffer. 4. 248. Weft of England. Ann. 7.

IBERIS. Candy-tuft.

1. I. *amara*, bitter. 1. 52. Chalky fields, rare. Ann. 7.

ISATIS. Woad.

1. I. *tinctoria*, dyer's. 2. 97. Fields, rare. Bienn. 7.

BUNIAS. Sea Rocket.

1. B. *Cakile*, common. 4. 231. Sandy fhore. Ann. 6—9.

CRAMBE. Kale.

1. C. *maritima*, fea. 13. 924. Sandy fea-coaft. Per. 5, 6.

Ord. 2. *Siliquofa.*

DENTARIA. Coral-wort.

1. D. *bulbifera*, bulbiferous. 5. 309. Shady places, rare. Per. 4, 5.

CARDAMINE. Ladies'-fmock.

1. C. *bellidifolia*, daify-leaved. 33. 2355. Mountains, rare. Per. 8.
2. C. *impatiens*, impatient. 2. 80. Stony mountains. Ann. 5, 6.
3. C. *hirfuta*, hairy. 7. 492. Wafte and cultivated ground. Ann. 3—6.
4. C. *pratenfis*, meadow. 11. 776. Meadows and paftures. Per. 4, 5.
5. C. *amara*, bitter. 14. 1000. Watery places, rare. Per. 4, 5.

SISYMBRIUM. Rocket.

1. S. *Nafturtium*, water-crefs. 12. 855. Running waters. Per. 6, 7.
2. S. *fylveftre*, creeping water. 33. 2324. Inundated gravel. Per. 6—9.
3. S. *terreftre*, annual water. 25. 1747. Watery places. Ann. 6—9.
4. S. *amphibium*, great water. 26. 1840. Rivers. Per. 6—8.
5. S. *tenuifolium*, greater wall. 8. 525. Walls and rubbifh. Per. 7—10.
6. S. *murale*, fpreading wall. 16. 1090. Sandy waftes. Ann. 8—10.
7. S. *monenfe*, dwarf fea. 14. 962. Sandy coafts, rare. Per. 6, 7.
8. S. *Sophia*, flix-weed. 14. 963. Wafte ground. Ann. 7.
9. S. *Irio*, London. 23. 1631. Rubbifh and walls. Ann. 7, 8.

ERYSIMUM. Hedge-muftard.

1. E. *officinale*, common. 11. 735. Wafte places, and roads. Ann. 6, 7.

2. E.

2. E. *Barbarea*, bitter winter-crefs. 7. 443. Rubbifh and ditches. Per. 5—8.
3. E. *præcox*, early winter-crefs. 16. 1129. Watery places. Bienn. 4—10.
4. E. *Alliaria*, garlick. 12. 796. Hedges, common. Bienn. 5.
5. E. *cheiranthoides*, treacle. 14. 942. Fields and willow-beds. Ann. 7.

CHEIRANTHUS. Stock.

1. C. *fruticulofus*, wall-flower. 27. 1934. Old walls. Per. 5, 6.
2. C. *incanus*, hoary fhrubby. 27. 1935. Sea cliffs, rare. Shrubby. 5.
3. C. *finuatus*, fea. 7. 462. Welch coaft. Bienn. 8.

HESPERIS. Dame's-violet.

†1. H. *inodora*, fcentlefs. 11. 731. Banks of rivulets, rare. Per. 5, 6.

ARABIS. Wall-crefs.

1. A. *thaliana*, common. 13. 901. Walls and banks. Ann. 4.
2. A. *ftricta*, Briftol rock. 9. 614. Rocks, Briftol. Per. 5.
3. A. *hifpida*, alpine rock. 7. 469. (Cardamine haftulata). Rocks. Per. 6, 7.
4. A. *Turrita*, tower. 3. 178. Walls, rare. Bienn. 5.

TURRITIS. Tower-muftard.

1. T. *glabra*, fmooth. 11. 777. Gravelly banks. Ann. 5, 6.
2. T. *hirfuta*, hairy. 9. 587. Rocks and walls. Per. 5.
3. T. *alpina*, alpine. 25. 1746. Weft of Ireland. Bienn. 7.

BRASSICA. Cabbage.

1. B. *orientalis*, perfoliate. 26. 1804. Fields and cliffs, Ann. 6.
2. B. *campeftris*, field. 32. 2234. Fields. Ann. 6.
3. B. *Napus*, rape, or navew. 30. 2146. Fields and banks. Bienn. 5.
4. B. *Rapa*, turnep. 31. 2176. Fields. Bienn. 4.
5. B. *oleracea*, fea. 9. 637. Sea cliffs. Bienn. 5, 6.

SINAPIS. Muftard.

1. S. *arvenfis*, charlock. 25. 1748. Fields, common. Ann. 5.
2. S. *alba*, white. 24. 1677. Fields. Ann. 6.
3. S. *nigra*, common. 14. 969. Fields and banks. Ann. 6.

RAPHANUS. Radifh.

1. R. *Raphaniftrum*, wild. 12. 856. Corn-fields. Ann. 6, 7.
2. R. *maritimus*, fea. 23. 1643. Sea-coaft. Bienn. 6.

Clafs 16. MONADELPHIA.

Ord. 1. *Pentandria*.

ERODIUM. Stork's-bill.

1. E. *cicutarium*, hemlock. 25. 1768. Rubbifh and fand. Ann. 6—8.
2. E. *mofchatum*, mufky. 13. 902. Mountain paftures. Ann. 6, 7.
3. E. *maritimum*, fea. 9. 646. Sandy coaft. Per. 5—9.

Ord. 2. *Decandria*.

GERANIUM. Crane's-bill.

1. G. *phæum*, dufky. 5. 322. Mountain thickets. Per. 5, 6.
2. G. *nodofum*, knotty. 16. 1091. Mountains, rare. Per. 5—8.
3. G. *fylvaticum*, wood. 2. 121. Mountain thickets. Per. 6, 7.
4. G. *pratenfe*, crowfoot-leaved. 6. 404. Hilly paftures. Per. 6, 7.
5. G. *robertianum*, ftinking. 21. 1486. Rubbifh and banks. Ann. 5—10.
6. G. *lucidum*, fhining. 2. 75. Walls and ftony places. Ann. 5—8.
7. G. *molle*, dove's-foot. 11. 778. Paftures and rubbifh. Ann. 4—8.
8. G. *pufillum*, fmall-flowered. 6. 385. Gravelly ground. Ann. 6—9.
9. G. *pyrenaicum*, mountain. 6. 405. Meadows and paftures. Per. 7.
10. G. *rotundifolium*, round-leaved. 3. 157. Gravelly banks. Ann. 6, 7.
11. G. *diffectum*, jagged-leaved. 11. 753. Barren banks. Ann. 5, 6.
12. G. *columbinum*, long-ftalked. 4. 259. Chalky banks. Ann. 6, 7.
13. G. *fanguineum*, bloody. 4. 272. Rocks and hills. Per. 7—9.

Ord. 3. *Polyandria*.

ALTHÆA. Marfh-mallow.

1. A. *officinalis*, common. 3. 147. Sea marfhes. Per. 7—9.

MALVA. Mallow.

1. M. *fylveftris*, common. 10. 671. Hedges and rubbifh. Per. 5—8.
2. M. *rotundifolia*, dwarf. 16. 1092. β. 4. 241. Rubbifh. Ann. 6—9.
3. M. *mofchata*, mufk. 11. 754. Gravelly banks. Per. 7, 8.

LAVATERA. Tree-mallow.

1. L. *arborea*, fea. 26. 1841. Sea-coaft, rare. Bienn. 7—10.

Clafs 17. DIADELPHIA.

Ord. 1. *Hexandria*.

FUMARIA. Fumitory.

1. F. *folida*, folid bulbous. 21. 1471. Northern woods. Per. 4, 5.
2. F. *lutea*, yellow. 9. 588. Old walls. Per. 5.
3. F. *officinalis*, common. 9. 589. Cultivated ground. Ann. 5—8.
4. F. *parviflora*, fmall-flowered. 9. 590. Fields, in the fouth. Ann. 8, 9.
5. F. *capreolata*, ramping. 14. 943. Fields, rare. Ann. 6—9.
6. F. *claviculata*, white climbing. 2. 103. Gravelly thickets. Ann. 6, 7.

Ord. 2. *Octandria.*

POLYGALA. Milkwort.

1. P. *vulgaris*, common. 2. 76. Sunny pastures. Per. 6, 7.

Ord. 3. *Decandria.*

SPARTIUM. Broom.

1. S. *scoparium*, common. 19. 1339. Dry hills and fields. Shrub. 5, 6.

GENISTA. Green-weed.

1. G. *tinctoria*, dyer's. 1. 44. Pastures and thickets. Shrub. 7, 8.
2. G. *pilosa*, hairy. 3. 208. Barren heaths, rare. Shrubby. 5.
3. G. *anglica*, needle. 2. 132. Moist heaths. Low shrub. 5, 6.

ULEX. Furze.

1. U. *europæus*, common. 11. 742. Heaths and sandy downs. Shrub. 5—12.
2. U. *nanus*, dwarf. 11. 743. Elevated heaths. Shrub. 8—10.

ONONIS. Rest-harrow.

1. O. *arvensis*, common. 10. 682. Barren pastures, &c. Per. 6—8.

ANTHYLLIS. Kidney-vetch.

1. A. *vulneraria*, ladies'-finger. 2. 104. Chalky hills. Per. 6—8.

PISUM. Pea.

1. P. *maritimum*, sea. 15. 1046. Stony sea beach. Per. 7.

OROBUS. Bitter-vetch.

1. O. *tuberosus*, heath. 17. 1153. Heaths and thickets. Per. 5, 6.
2. O. *sylvaticus*, wood. 8. 518. Mountain woods. Per. 5, 6.

LATHYRUS. Lathyrus.

1. L. *Aphaca*, yellow vetchling. 17. 1167. Gravelly banks, rare. Ann. 6—8.
2. L. *Nissolia*, crimson grassy. 2. 112. Bushy places. Ann. 5.
3. L. *hirsutus*, rough-podded. 18. 1255. Fields, rare. Ann. 7.
4. L. *pratensis*, yellow meadow. 10. 670. Meadows and pastures. Per. 7, 8.
5. L. *sylvestris*, narrow-leaved. 12. 805. Moist thickets. Per. 7, 8.
6. L. *latifolius*, broad-leaved. 16. 1108. Woods, rare. Per. 7, 8.
7. L. *palustris*, marsh. 3. 169. Wet thickets. Per. 7, 8.

VICIA. Vetch.

1. V. *sylvatica*, wood. 2. 79. Mountain thickets. Per. 7, 8.
2. V. *Cracca*, tufted. 17. 1168. Meadows and hedges. Per. 7, 8.
3. V. *sativa*, common. 5. 334. Fields and grassy places. Ann. 5, 6.
4. V. *lathyroides*, spring. 1. 30. Gravelly fields. Ann. 4, 5.
5. V. *lutea*, rough-podded yellow. 7. 481. Stony beach. Per. 8.
6. V. *hybrida*, hairy-flowered yellow. 7. 482. Thickets, rare. Per. 6.
7. V. *lævigata*, smooth-podded sea. 7. 483. Stony beach, rare. Per. 8.
8. V. *sepium*, bush. 22. 1515. Bushy places, common. Per. 5, 6.
9. V. *bithynica*, rough-podded purple. 26. 1842. Pastures, rare. Per. 7, 8.

ERVUM. Tare.

1. E. *tetraspermum*, smooth. 17. 1223. Moist fields. Ann. 6.
2. E. *hirsutum*, hairy. 14. 970. Fields and meadows. Ann. 6.

ORNITHOPUS. Bird's-foot.

1. O. *perpusillus*, common. 6. 369. Gravel or sand. Ann. 5.

HIPPOCREPIS. Horse-shoe-vetch.

1. H. *comosa*, tufted. 1. 31. Chalky hills. Per. 5—8.

HEDYSARUM. Saint-foin.

1. H. *Onobrychis*, common. 2. 96. Chalky hills. Per. 6, 7.

ASTRAGALUS. Milk-vetch.

1. A. *glycyphyllos*, sweet. 3. 203. Chalky thickets. Per. 6.
2. A. *hypoglottis*, purple mountain. 4. 274. Chalk or sand. Per. 6, 7.
3. A. *uralensis*, hairy mountain. 7. 466. Scottish hills. Per. 7.
4. A. *campestris*, yellowish mountain. 36. 2522. Highlands. Per. 7.

TRIFOLIUM. Trefoil.

1. T. *officinale*, melilot. 19. 1340. Bushy places. Ann. 6, 7.
2. T. *ornithopodioides*, bird's-foot. 15. 1047. Gravelly heaths. Ann. 6, 7.
3. T. *repens*, white clover. 25. 1769. Meadows, common. Per. 5—9.
4. T. *subterraneum*, subterraneous. 15. 1048. Gravelly pastures. Ann. 5.
5. T. *ochroleucum*, sulphur-coloured. 17. 1224. Dry pastures. Per. 6, 7.
6. T. *pratense*, common purple clover. 25. 1770. Meadows and pastures. Per. 5—9.
7. T. *medium*, zigzag. 3. 190. Chalky or gravelly pastures. Per. 7.
8. T. *maritimum*, teasel-headed. 4. 220. Muddy sea shore. Ann. 6, 7.
9. T. *stellatum*, starry-headed. 22. 1545. South coast. Ann. 7.
10. T. *arvense*, hare's-foot. 14. 944. Sandy fields. Ann. 7, 8.
11. T. *scabrum*, rough. 13. 903. Chalk or sand. Ann. 5, 6.
12. T. *glomeratum*, round-headed. 15. 1063. Gravelly pastures. Ann. 6.
13. T. *striatum*, soft knotted. 26. 1843. Barren ground. Ann. 6.
14. T. *suffocatum*, suffocated. 15. 1049. Sea sand. Ann. 6, 7.
15. T. *fragiferum*, strawberry-headed. 15. 1050. Moist pastures. Per. 7, 8.
16. T. *procumbens*, hop. 14. 945. Dry gravelly pastures. Ann. 6, 7.

17. T. *minus*, leſſer yellow. 18. 1256. Gravelly ground. Ann. 6, 7.
18. T. *filiforme*, ſlender yellow. 18. 1257. Moiſt gravel. Ann. 6, 7.

LOTUS. Bird's-foot Trefoil.

1. L. *corniculatus*, common. 30. 2090. Paſtures, common. Per. 6—8.
2. L. *major*, greater. 30. 2091. Wet buſhy places. Per. 7, 8.
3. L. *diffuſus*, ſlender. 13. 925. Rocks, ſouth coaſt. Per? 5, 6.

MEDICAGO. Medick.

*1. M. *ſativa*, purple, or lucerne. 25. 1749. Meadows and paſtures. Per. 6, 7.
2. M. *falcata*, yellow. 15. 1016. Gravelly and chalky banks. Per. 7.
3. M. *lupulina*, black. 14. 971. Meadows and paſtures. Ann. 5—8.
4. M. *maculata*, ſpotted. 23. 1616 (polymorpha). Gravelly banks. Ann. 5, 6.
5. M. *muricata*, flat-toothed. Pluk. Phyt. t. 113. f. 6. Suffolk coaſt. Ann. 6.
6. M. *minima*, little bur. Fl. Dan. t. 211. Chalky ground. Ann. 6.

Claſs 18. POLYADELPHIA.

Ord. 1. *Polyandria.*

HYPERICUM. St. John's-wort.

1. H. *calycinum*, large-flowered. 29. 2017. Thickets, Ireland. Shrubby. 7—9.
2. H. *Androſæmum*, tutſan. 18. 1225. Woods, rare. Per. 7, 8.
3. H. *quadrangulum*, ſquare. 6. 370. Moiſt meadows. Per. 7, 8.
4. H. *perforatum*, perforated. 5. 295. Buſhy places. Per. 7, 8.
5. H. *dubium*, imperforate. 5. 296. Mountain thickets. Per. 7, 8.
6. H. *humifuſum*, trailing. 18. 1226. Paſtures and groves. Per. 7.
7. H. *montanum*, mountain. 6. 371. Buſhy hills. Per. 7.
8. H. *barbatum*, bearded. 28. 1986. Thickets, Scotland. Per. 9, 10.
9. H. *hirſutum*, hairy. 17. 1156. Chalky banks. Per. 6, 7.
10. H. *pulchrum*, ſmall upright. 18. 1227. Clay heaths. Per. 7.
11. H. *elodes*, marſh. 2. 109. Spongy bogs. Per. 7, 8.

Claſs 19. SYNGENESIA.

Ord. 1. *Polygamia æqualis.*

TRAGOPOGON. Goat's-beard.

1. T. *pratenſis*, yellow. 7. 434. Graſſy paſtures. Bienn. 6.
2. T. *porrifolius*, purple. 9. 638. Moiſt meadows, rare. Bienn. 5, 6.

PICRIS. Ox-tongue.

1. P. *echioides*, briſtly. 14. 972. Clay paſtures and banks. Ann. 6, 7.
2. P. *hieracioides*, hawkweed. 3. 196. Gravel or chalk. Bienn. 7, 8.

SONCHUS. Sow-thiſtle.

1. S. *cæruleus*, blue. 34. 2425. Highland paſtures, rare. Per. 7, 8.
2. S. *paluſtris*, tall marſh. 13. 935. Banks of rivers. Per. 7, 8.
3. S. *arvenſis*, corn. 10. 674. Corn-fields, on clay. Per. 8.
4. S. *oleraceus*, common. 12. 843. Fields, banks, and rubbiſh. Ann. 7—9.

LACTUCA. Lettuce.

1. L. *viroſa*, ſtrong-ſcented. 28. 1957. Chalky banks. Bienn. 8, 9.
2. L. *Scariola*, prickly. 4. 268. Rubbiſh, rare. Bienn. 8.
3. L. *ſaligna*, leaſt. 10. 707. Chalky banks. Bienn. 8.

PRENANTHES. Wall-Lettuce.

1. P. *muralis*, ivy-leaved. 7. 457. Walls, or chalky groves. Per. 7.

LEONTODON. Dandelion.

1. L. *Taraxacum*, common. 8. 510. Meadows and paſtures. Per. 4—7.
2. L. *paluſtre*, marſh. 8. 553. Moiſt meadows. Per. 6, 7.

APARGIA. Hawkbit.

Schreb. 527. *Willd. Sp. Pl.* v. 3. 1547. *Sm. Prodr. Fl. Græc. Sibth.* v. 2. 130. *Ait. Hort. Kew.* v. 4. 445. Hedypnois; *Hudſ.* 340. *Sm. Fl. Brit.* 823.

Eſſ. Ch. Receptacle naked, dotted. Calyx imbricated. Seed-down feathery, ſeſſile, unequal.

1. A. *hiſpida*, rough. 8. 554. (Hedypnois hiſpida). Chalky paſtures. Per. 7.

Stalks radical, ſingle-flowered. Leaves toothed, rough. Florets hairy at the orifice, glandular at the extremity.

2. A. *hirta*, deficient. 8. 555. (H. hirta). Gravelly paſtures. Per. 7, 8.

Stalks radical, ſingle-flowered. Leaves toothed, rough. Calyx nearly ſmooth. Outer row of ſeeds naked.

3. A. *Taraxici*, alpine. 16. 1109. (H. Taraxici). Alpine rills. Per. 8.

Stalks radical, moſtly ſingle-flowered. Leaves with reverſed teeth, ſmooth. Calyx hairy.

4. A. *autumnalis*, autumnal. 12. 830. (H. autumnalis). Paſtures. Per. 8.

Stalk radical, branched; ſubdiviſions ſcaly. Leaves lanceolate, ſmoothiſh; toothed or pinnatifid.

Willdenow has, in all, 17 ſpecies of this genus, among which are *Leontodon alpinum*, Jacq. Auſtr. t. 93; *L. haſtile*, Linn. Sp. Pl. 1123: *L. tuberoſum*, ibid: *Hieracium incanum*, Jacq. Auſtr. t. 287: *Leontodon criſpum*, Villars Dauph. v. 3. 84. t. 25: *L. coronopifolium*, Desfont. Atlant. v. 2. 229. t. 214: and *L. hiſpidum*, Cavan. Ic. t. 149; the latter named *Apargia hiſpanica*, Willd. n. 14. See HEDYPNOIS.

HIERACIUM. Hawkweed.

1. H. *alpinum*, alpine ſingle-flowered. 16. 1110. Alpine rocks. Per. 7.
2. H. *Piloſella*, mouſe-ear. 16. 1093. Paſtures and walls. Per. 5—7.
3. H. *dubium*, branching mouſe-ear. 33. 2332. Hills, rare. Per. 7, 8.
†4. H. *Auricula*, orange mouſe-ear. 33. 2368. Mountains? Per. 7, 8.

5. H. *aurantiacum*, great orange. 21. 1469. Woods, Scotland. Per. 6, 7.

6. H. *murorum*, wall. 29. 2082. Rocks and walls. Per. 6.

7. H. *maculatum*, ſtained-leaved. 30. 2121. Mountain rocks. Per. 6.

8. H. *ſylvaticum*, wood. 29. 2031. Rocks and walls, common. Per. 6, 7.

9. H. *pulmonarium*, lungwort. 33. 2307. Rocks, Scotland. Per. 7.

10. H. *Lawſoni*, glaucous hairy. 29. 2083. North of England. Per. 7.

11. H. *paludoſum*, ſuccory-leaved mountain. 16. 1094. Mountain rills. Per. 7.

12. H. *molle*, ſoft-leaved. 31. 2210. Woods, Scotland. Per. 7, 8.

13. H. *cerinthoides*, honeywort-leaved. 34. 2378. Rocks, Scotland. Per. 8.

14. H. *villoſum*, ſhaggy alpine. 34. 2379. Highlands. Per. 8.

15. H. *ſabaudum*, ſhrubby broad-leaved. 5. 349. Groves. Per. 8, 9.

16. H. *denticulatum*, ſmall-toothed. 30. 2122. Woods, Scotland. Per. 8, 9.

17. H. *prenanthoides*, rough-bordered. 32. 2235. Woods, Scotland. Per. 8.

18. H. *umbellatum*, narrow-leaved. 25. 1771. Stony groves. Per. 8, 9.

Crepis. Hawk's-beard.

1. C. *fœtida*, ſtinking. 4. 406. Chalky paſtures, rare. Bienn. 6, 7.

2. C. *pulchra*, ſmall-flowered. 33. 2325. Rocks, Scotland. Ann. 6—9.

3. C. *tectorum*, ſmooth. 16. 1111. Paſtures and rubbiſh. Ann. 6—9.

4. C. *biennis*, rough. 3. 149. Chalky paſtures. Bienn. 6, 7.

Hypochæris. Cat's-ear.

1. H. *maculata*, ſpotted. 4. 225. Chalky downs. Per. 7.

2. H. *glabra*, ſmooth. 8. 575. Gravelly fields. Ann. 6—8.

3. H. *radicata*, long-rooted. 12. 831. Meadows and paſtures. Per. 6—8.

Lapsana. Nipple-wort.

1. L. *communis*, common. 12. 844. Fields and rubbiſh. Ann. 6, 7.

2. L. *puſilla*, little. 2. 95. (Hyoſeris minima). Gravelly fields. Ann. 6.

Stem none. Stalks ſubdivided; ſwelling and hollow at the ſummit. Leaves obovate. The *ſeeds* have an elevated border, which is unlike the true *Lapſana*, but this plant is perhaps better placed here than elſewhere. See Lapsana.

Cichorium. Succory.

1. C. *Intybus*, wild. 8. 539. Gravel or chalk. Per. 7, 8.

Arctium. Bur-dock.

1. A. *Lappa*, common. 18. 1228. Waſte places. Bienn. 7, 8.

2. A. *Bardana*, woolly-headed. 35. 2478. Waſte hilly ground. Bienn. 7, 8.

Serratula. Saw-wort.

1. S. *tinctoria*, common. 1. 38. Groves and thickets. Per. 7, 8.

2. S. *alpina*, alpine. 9. 599. Alpine rocks. Per. 7, 8.

Carduus. Thiſtle.

1. C. *nutans*, muſk. 16. 1112. Gravelly or chalky fields. Ann. 7, 8.

2. C. *acanthoides*, curled or welted. 14. 973. Waſte ground. Ann. 6, 7.

3. C. *tenuiflorus*, ſlender-flowered. 6. 412. Banks, rare. Ann. 6, 7.

4. C. *marianus*, milk. 14. 976. Banks and hedges. Ann. 8.

Cnicus. Plume-thiſtle.

1. C. *lanceolatus*, ſpear. 2. 107. (Carduus lanceolatus). Banks. Bienn. 6—9.

2. C. *paluſtris*, marſh. 14. 974. (Card. paluſtris). Moiſt paſtures. Bienn. 7, 8.

3. C. *arvenſis*, creeping. 14. 975. (Card. arvenſis). Fields and roads. Per. 7.

4. C. *eriophorus*, woolly-headed. 6. 386. (Card. erioph.) Chalk or gravel. Bienn. 8.

5. C. *tuberoſus*, tuberous. 36. 2562. Woods, Wiltſhire. Per. 8.

6. C. *heterophyllus*, melancholy. 10. 675 (Card. heteroph.) Mountain paſtures. Per. 7, 8.

7. C. *pratenſis*, meadow. 3. 177 (Card. prat.) Moiſt paſtures. Per. 6.

8. C. *acaulis*, dwarf. 3. 161 (Card. acaulis). Gravel or chalk. Per. 7, 8.

Onopordum. Cotton-thiſtle.

1. O. *Acanthium*, common. 14. 977. Gravelly banks. Bienn. 7.

Carlina. Carline-thiſtle.

1. C. *vulgaris*, common. 16. 1144. Dry ſandy fields. Bienn. 6.

Bidens. Bur-marygold.

1. B. *tripartita*, trifid. 16. 1113. Ditches and puddles. Ann. 8, 9.

2. B. *cernua*, nodding. 16. 1114. Watery places. Ann. 9.

Eupatorium. Hemp-agrimony.

1. E. *cannabinum*, common. 6. 428. Watery boggy places. Per. 7, 8.

Chrysocoma. Goldy-locks.

1. C. *Linoſyris*, flax-leaved. 35. 2505. Sea cliffs, Devonſhire. Per. 9.

Santolina. Cotton-weed.

1. S. *maritima*, ſea. 2. 141. Sandy beach, rare. Per. 8, 9.

Ord. 2. *Polygamia-ſuperflua.*

Tanacetum. Tanſy.

1. T. *vulgare*, common. 18. 1229. Hills and way ſides. Per. 7, 8.

Artemisia.

ARTEMISIA. Mugwort.

1. A. *campeſtris*, field ſouthernwood. 5. 338. Sandy fields, rare. Per. 8.
2. A. *maritima*, drooping ſea wormwood. 24. 1706. Muddy ſea ſhore. Per. 8.
3. A. *gallica*, upright ſea wormwood. 14. 1001 (maritima). Muddy ſhores. Per. 8.
Radical leaves capillary. Cluſters erect.
4. A. *Abſinthium*, common wormwood. 18. 1230. Rubbiſh. Per. 8.
5. A. *vulgaris*, common. 14. 978. Waſte ground, hedges, &c. Per. 8.
†6. A. *cæruleſcens*, blueiſh. 34. 2426. Sea ſhore, Lincolnſhire. *Hudſon*. Per. 8.

GNAPHALIUM. Cudweed.

1. G. *luteo-album*, Jerſey. 14. 1002. Sandy ground, Jerſey. Ann. 7, 8.
2. G. *margaritaceum*, American. 29. 2018. Meadows, rare. Per. 8.
3. G. *dioicum*, mountain. 4. 267. Dry mountain paſtures. Per. 6, 7.
4. G. *ſylvaticum*, Highland. 13. 913. Alpine paſtures. Per. 8.
5. G. *rectum*, upright wood. 2. 124. Sandy thickets. Per. 8.
6. G. *ſupinum*, dwarf. 17. 1193. Micaceous mountains. Per. 7.
7. G. *uliginoſum*, marſh. 17. 1194. Sandy puddles. Ann. 8.
8. G. *gallicum*, narrow-leaved. 33. 2369. Gravelly fields, rare. Ann. 7, 8.
9. G. *minimum*, leaſt. 17. 1157. Barren gravelly fields. Ann. 7.
10. G. *germanicum*, common. 14. 946. Gravelly fields. Ann. 7, 8.

CONYZA. Spikenard.

1. C. *ſquarroſa*, plowman's. 17. 1195. Calcareous paſtures. Bienn. 7, 8.

ERIGERON. Flea-bane.

*1. E. *canadenſe*, Canada. 29. 2019. Fields and rubbiſh. Ann. 8, 9.
2. E. *acre*, blue. 17. 1158. Dry gravelly ground. Bienn. 7, 8.
3. E. *alpinum*, alpine. 7. 464. Alpine rills, Scotland. Per. 7.
4. E. *uniflorum*, pale mountain. 34. 2416. Highlands. Per. 7.
Stems moſtly ſingle-flowered. Calyx hairy. Florets of the radius erect, ſomewhat tubular.

TUSSILAGO. Colt's-foot.

1. T. *Farfara*, common. 6. 429. Moiſt chalk. Per. 3, 4.
2. T. *hybrida*, tall butter-bur. 6. 430. Moiſt meadows, rare. Per. 4.
3. T. *Petaſites*, common butter-bur. 6. 431. Moiſt meadows. Per. 4.

SENECIO. Ragwort.

1. S. *vulgaris*, common groundſel. 11. 747. Fields and rubbiſh. Ann. 3—10.
2. S. *viſcoſus*, ſtinking. 1. 32. Chalky banks, rare. Ann. 7—10.
3. S. *lividus*, green-ſcaled. 35. 2515. Barren heaths. Ann. 9, 10.
4. S. *ſylvaticus*, mountain. 11. 748. Gravelly thickets. Ann. 7, 8.
5. S. *ſqualidus*, inelegant. 9. 600. Walls, Oxford. Ann. 6—10.
6. S. *tenuifolius*, hoary. 8. 574. Chalky hedges. Per. 7, 8.
7. S. *Jacobæa*, common. 16. 1130. Paſtures and meadows. Per. 7, 8.
8. S. *aquaticus*, marſh. 16. 1131. Marſhes. Per. 7, 8.
9. S. *paludoſus*, fen. 10. 650. Fens, rare. Per. 6, 7.
10. S. *ſaracenicus*, broad-leaved. 31. 2211. Moiſt hills. Per. 7, 8.

ASTER. Star-wort.

1. A. *Tripolium*, ſea. 2. 87. Muddy ſea ditches. Per. 8, 9.

SOLIDAGO. Golden-rod.

1. S. *Virgaurea*, common. 5. 301. Groves and heaths. Per. 7—9.

INULA. Inula.

1. I. *Helenium*, elecampane. 22. 1546. Moiſt paſtures, rare. Per. 7, 8.
2. I. *dyſenterica*, common fleabane. 16. 1115. Watery places. Per. 8.
3. I. *pulicaria*, ſmall fleabane. 17. 1196. Sandy puddles. Ann. 9.
4. I. *crithmoides*, ſamphire-leaved. 1. 68. Muddy ſaltmarſhes. Per. 8.

CINERARIA. Flea-wort.

1. C. *paluſtris*, marſh. 3. 151. Ditches and bogs. Per. 6, 7.
2. C. *integrifolia*, mountain. 3. 152. Chalky hills. Per. 5—7.

DORONICUM. Leopard's-bane.

1. D. *Pardalianches*, great. 9. 630. Mountain paſtures, rare. Per. 5.

BELLIS. Daiſy.

1. B. *perennis*, common. 6. 424. Paſtures. Per. 3—12.

CHRYSANTHEMUM. Ox-eye.

1. C. *Leucanthemum*, great white. 9. 601. Paſtures and fields. Per. 6, 7.
2. C. *ſegetum*, yellow corn. 8. 540. Cultivated fields. Ann. 6—8.

PYRETHRUM. Feverfew.

1. P. *Parthenium*, common. 18. 1231. Rubbiſh. Per. 6, 7.
2. P. *inodorum*, corn. 10. 676. Gravelly fields. Ann. 8, 9.
3. P. *maritimum*, ſea. 14. 979. Sea-coaſt, rare. Per. 7.

MATRICARIA. May-weed.

1. M. *Chamomilla*, wild chamomile. 18. 1232. Fields and dunghills. Ann. 5—7.

ANTHEMIS. Chamomile.

1. A. *maritima*, ſea. 33. 2370. Stony beach, rare. Ann. 7.
2. A. *nobilis*, common. 14. 980. Gravelly paſtures. Per. 8, 9.

3. A. *arvenfis*, corn. 9. 602. Gravelly fields. Ann. or Bienn. 6, 7.
4. A. *Cotula*, ftinking. 25. 1772. Fields, common. Ann. 6, 7.
5. A. *tinctoria*, ox-eye. 21. 1472. Stony banks, rare. Per. 7, 8.

ACHILLEA. Yarrow.

1. A. *Ptarmica*, goofe-tongue. 11. 757. Moift bufhy places. Per. 7, 8.
2. A. *ferrata*, ferrated. 36. 2531. Derbyfhire. Per. 8.

Leaves linear-lanceolate, feffile, downy, deeply ferrated; laciniated at the bafe. Corymbs nearly fimple. Fragrant; the *flowers* fmaller than thofe of *Ptarmica*, and yellowifh.

3. A. *Millefolium*, common. 11. 758. Paftures, common. Per. 6—8.
4. A. *tomentofa*, woolly yellow. 36. 2532. Paftures, Scotland and Ireland. Per. 8.

Ord. 3. *Polygamia-fruftranea.*

CENTAUREA. Knapweed.

1. C. *Jacea*, brown radiated. 24. 1678. Paftures, Suffex and Ireland. Per. 8, 9.
2. C. *nigra*, black leffer. 4. 278. Paftures, every where. Per. 6—8.
3. C. *Cyanus*, blue-bottle. 4. 277. Corn-fields, common. Ann. 7, 8.
4. C. *Scabiofa*, greater. 1. 56. Borders of fields. Per. 7, 8.
5. C. *Ifnardi*, Jerfey. 32. 2256. Paftures, Jerfey. Per. 7, 8.
6. C. *Calcitrapa*, red ftar-thiftle. 2. 125. Gravelly fandy ground. Ann. 7, 8.
7. C. *folftitialis*, yellow ftar-thiftle. 4. 243. Fields, rare. Ann. 7, 8.

Clafs 20. GYNANDRIA.

Ord. 1. *Monandria.*

The natural family of the *Orchideæ*, of which this order entirely confifts, has lately received fome frefh corrections from the able pen of Mr. R. Brown, given by Mr. Aiton in his new edition of the Hortus Kewenfis, v. 5, clafs *Gynandria*. By thefe we have profited in the following arrangement, where we have adopted feveral of Mr. Brown's new genera; only deriving their diftinctions from characters fomewhat different from his. It is a ftrong proof of the validity of fuch genera, that they will ftand this teft. We exclude the marks taken from the abfence, prefence, or number, of the minute pouches whence the maffes of pollen originate; not fo much on account of the difficulty of having recourfe to thofe parts in practice, but becaufe the diftinctions founded thereon do not appear to lead to the knowledge of natural genera. On the contrary, they rather fhew the danger of taking any technical character as an infallible guide throughout. We have therefore not adopted the *Gymnadenia*, nor the *Habenaria* of this ingenious writer, becaufe they feem to us naturally to belong to *Orchis*. Nevertheless, we readily fubmit our opinion to the correction of thofe who, on mature enquiry, may think otherwife. What is to become of Willdenow's HABENARIA, fee that article, muft be decided by the future ftudy of exotic *Orchideæ*, fcarcely known fufficiently at prefent, to any European botanift, to enable him to form an opinion. See ORCHIDEÆ, ORCHIS, OPHRYS, NEOTTIA, EPIPACTIS and MALAXIS.

The *Orchideæ* are difpofed in three very natural fections, which give the leading diftinctions of the genera. 1ft. Anther united to, or rather a continuation of, the column; terminal, in a manner, though fometimes furmounted by a point. 2d. Anther parallel to the ftigma, and oppofite to that part. 3d. Anther a terminal vertical moveable lid, either permanent or deciduous. Mr. Brown fubdivides this third fection, according to the anther being permanent or not, which feems to us unneceffary.

Section 1.

ORCHIS. Orchis.

Eff. Ch. Nectary with a pofterior fpur.

1. O. *bifolia*, butterfly. 1. 22. Woods, efpecially on chalk. Per. 6.

Bulbs undivided. Lip of the nectary lanceolate, entire; fpur very long. Lateral calyx-leaves fpreading, deflexed. This is referred to *Habenaria* by Mr. Brown, becaufe the maffes of pollen originate from two diftant glands, which are naked, or deftitute of a pouch at the bafe. The *flowers* are fnow-white, with fome touches of green, and fmell powerfully, in an evening only, like a very fweet honey-fuckle.

2. O. *pyramidalis*, pyramidal. 2. 110. Chalky paftures. Per. 7.

Bulbs undivided. Lip of the nectary in three equal entire fegments, with two prominences above; fpur elongated, thread-fhaped. This and the fix following, having the gland, or glands, of their maffes of pollen enclofed in a fingle pouch, belong to the true genus of *Orchis*. *Br.*

The *flowers* of *O. pyramidalis* are crimfon, fragrant, compofing a fhort, denfe, pyramidal fpike.

3. O. *Morio*, meadow. 29. 2059. Moift paftures. Per. 5, 6.

Bulbs undivided. Lip of the nectary four-cleft, crenate; fpur obtufe, afcending. Calyx many-ribbed.

Leaves without fpots. *Flowers* purple or crimfon. The three *calyx-leaves* cohere together, in the form of a hood, and are ribbed with green.

4. O. *mafcula*, early purple. 9. 631. Meadows and groves. Per. 4, 5.

Bulbs undivided. Lip of the nectary four-cleft, crenate; fpur obtufe. Lateral calyx-leaves reflexed upward.

The *leaves* are fpotted with black. *Flowers* purple, fcentlefs. *Calyx-leaves* with only three ribs, of their own colour. The *ftalk*, *bracteas*, and *germens* are purple.

5. O. *uftulata*, dwarf. 1. 18. Chalky hills. Per. 6.

Bulbs undivided. Lip of the nectary four-cleft, rough, with prominent points; fpur obtufe, one-third the length of the germen.

Three inches high. *Calyx* almoft black. *Lip* purple, with entire lobes. *Flowers* fmall.

6. O. *militaris*, narrow-lipped military. 27. 1873. Chalk hills. Per. 5.

Bulbs undivided. Lip of the nectary five-cleft, rough; fegments linear. Calyx and petals taper-pointed, confluent.

A foot high. *Leaves* light green, unfpotted. *Flowers* rofe-coloured, their *calyx* paler, or whitifh. This whole plant, like the following, while drying, exhales a powerful fcent of melilot, woodruff, or new hay.

7. O. *fufca*, broad-lipped military. 1. 16. (O. militaris). Chalk hills. Per. 5.

Bulbs

Bulbs undivided. Lip of the nectary five-cleft, rough; segments dilated. Calyx-leaves confluent. Petals linear.

Larger. *Calyx* dark brown externally. *Petals* and *nectary* pink or purple.

8. O. *hircina*, lizard. 1. 34. (Satyrium hircinum). Thickets on chalk hills, very rare. Per. 7.

Bulbs undivided. Lip of the nectary three-cleft, downy; middle segment extremely long, linear, twisted, emarginate.

Largest and scarcest. British plant of this tribe, often a yard high, with from twenty to sixty *flowers*, whose smell is fetid, and goat-like. *Spur* shortish, green, like the *calyx* and *anther*. *Lip* two inches long, purplish-lead-coloured, with a white speckled downy disk.

9. O. *albida*, white mountain. 8. 505. (Satyr. albidum). Hills. Per. 6.

Bulbs clustered, in three pairs. Lip of the nectary in three deep acute segments; spur one-third the length of the germen.

A foot high, slender. *Flowers* small, numerous, in a dense spike, white, with a green lip, nearly inodorous.—This and the next are made *Habenariæ* by Mr. Brown.

10. O. *viridis*, green frog. 2. 94. (Satyr. viride). Meadows. Per. 6, 7.

Bulbs clustered. Lip of the nectary linear, with three terminal teeth; the middle one smallest; spur very short, emarginate.

Five inches high. *Flowers* green, shorter than their *bracteas*. *Lip* brownish.

11. O. *latifolia*, marsh. 33. 2308. Wet meadows. Per. 5, 6.

Bulbs clustered. Lip of the nectary crenate, obscurely three-cleft; spur conical. Bracteas longer than the flowers.

Stem hollow. *Leaves* unspotted. *Flowers* crimson, more or less deeply coloured.

12. O. *maculata*, spotted palmate. 9. 632, Pastures and groves. Per. 6, 7.

Bulbs palmate, spreading. Lip of the nectary crenate, three-lobed; spur cylindrical, shorter than the germen.

More slender. *Stem* solid. *Leaves* spotted. *Flowers* white, stained and dotted with violet.

13. O. *conopsea*, aromatic. 1. 10. Meadows and pastures. Per. 6.

Bulbs palmate. Lip of the nectary in three entire segments; spur bristle-shaped, twice as long as the germen.

Leaves narrow, unspotted. *Flowers* rather small, crimson, with a rich spicy odour.

This species alone constitutes Mr. Brown's genus of *Gymnadenia*, so called from γυμνος, *naked*, and αδην, *a gland*, because the glands supporting the masses of pollen are naked, or destitute of a pouch, and stand close together. In this last character alone the genus is made to differ from *Habenaria*, whose naked glands are more or less distant from each other. It seems to us that *Habenaria nigra*, this *Gymnadenia*, and *Orchis pyramidalis*, are so nearly akin, that no assumed character ought to separate them, and that they all truly belong to the genus *Orchis*.

Aceras. Man-Orchis.

Brown in Ait. Hort. Kew. v. 5. 191.

Eff. Ch. Calyx converging. Nectary plane, without a spur.—This genus of Mr. Brown's, whose name expresses the want of a spur, is well distinguished by that character from *Orchis*, with which it agrees in having one common pouch for the glands of the pollen. By this last mark Mr. Brown distinguishes it, on the other hand, from the true *Ophrys*, of which we shall presently speak. We readily admit the genus, as a most natural one, only preferring the more easy characters taken from the shape of the lip, and posture of the calyx.

1. A. *anthropophora*, green. 1. 29. (Ophrys anthropophora). Chalk. Per. 6.

Lip of the nectary longer than the germen. *Br.*

The *bulbs* are globose. *Leaves* unspotted. *Spike* rather long, of numerous scentless *flowers*, whose closed *calyx* is green, mostly bordered with brown. *Lip* long, dependent, yellow, without spots; its segments four, shaped like those of the *Orchis militaris*, but generally without the small intermediate tooth.

Herminium. Musk-Orchis.

Brown in Ait. Hort. Kew. v. 5. 191.

Eff. Ch. Calyx spreading. Petals three-lobed, shaped like the nectary, which has no spur.

This genus, and its name, are revived from the early works of Linnæus. The application of the latter, derived, as it seems, from ἑρμα or ἑρμιν, *a basis*, or *foundation*, is not evident to us. The glands of the pollen are naked and distinct, so that it differs from *Habenaria* of Mr. Brown, as his *Aceras* does from *Orchis*, in the want of a spur. We most readily adopt the genus, only preferring, instead of a character derived from the glands, the striking one of the three-lobed *petals*, and their uniformity with the *lip*, the very same uniformity which characterises the West Indian orchideous genus of *Stelis*.

1. H. *monorchis*, small. 1. 71. (Ophrys monorchis). Chalk hills. Per. 6.

Leaves radical, two, lanceolate. *Br.*

Three inches high. *Bulbs* round, one of them remote. *Leaves* light green. *Flowers* small, pale yellow, musky.

Ophrys. Insect-Orchis.

Eff. Ch. Calyx spreading. Nectary convex, without a spur.

See the article Ophrys, where we have given Mr. Brown's characters of this most natural genus. We wish to strengthen, not to invalidate them, by those which, in conformity to our plan, we have taken from the position of the *calyx*, and shape of the *lip*. See Aceras just mentioned.

1. O. *muscifera*, fly. 1. 64. Chalky pastures, sparingly. Per. 6.

Lip of the nectary four-lobed, elongated, somewhat downy; its disk polished. Column obtuse.

Bulbs ovate. *Stem* a foot high. *Leaves* unspotted. *Spike* lax. *Calyx* green. *Petals* linear, of a dull deep purple. *Lip* of the same colour, with a blueish, shining, broad, transverse stripe in the middle. The *column* has no terminal point.

2. O. *apifera*, bee. 6. 383. Chalky pastures. Per. 7.

Lip of the nectary five-cleft, inflated; its small terminal segment awl-shaped, recurved. Column with a hooked point.

Rather larger, with broader *leaves*. *Flowers* much larger. *Calyx* pale purple, with green ribs. *Petals* oblong, green, fringed with white. *Lip* resembling the body of a bee, very prominent and convex, hairy, elegantly variegated with brown and yellow; its margin bent backward, the little terminal point only being recurved forward.

3. O. *aranifera*, spider. 1. 65. Chalk-pits. Per. 4.

Lip

Lip of the nectary villous, three-lobed, emarginate, pointless, deflexed. Column acute.

Of more humble growth than the last, with a green *calyx*, and yellowish-green *petals*. The *lip* is like the body of a spider, brown, with two principal longitudinal paler stripes, the margin pale, and bent backward, destitute of the pointed appendage seen in the *apifera*.

The *O. arachnoides*, Andr. Repos. t. 470, a native of Italy and Switzerland, not yet observed in Britain, is a very distinct species from all these. Haller has figured it in his *Historia*, t. 24, by the name of *Orchis fuciflora;* but his account and synonyms are much confused. Andrews confounds it with our *aranifera*, which is Curtis's *fucifera*, not *fuciflora*. Its character consists in the smallness of the reddish *petals*, which are not one-third the size of the white *calyx-leaves;* and especially in the margin of the very broad *lip* being dilated, and, as well as the pointed appendage, reflexed. This species is omitted in *Hort. Kew.* We have received it long ago from the garden of John Walker, esq. of Arno's grove, Southend.

Section 2.

NEOTTIA. Lady's Traces.

Eff. Ch. Calyx converging, embracing with its base the nectary, which has no spur. Petals converging. Column without a border. See NEOTTIA.

1. N. *spiralis*, spiral. 8. 541. (Ophrys spiralis.) Pastures. Per. 8, 9.
2. N. *repens*, creeping. 5. 289. (Satyrium repens.) Alpine woods. Per. 7.

This last is made a distinct genus by Mr. Brown, on account of a pouch under the *lip;* and named *Goodyera*, after the venerable and accurate contributor to the second edition of Gerarde's herbal. We lament that we are not sufficiently satisfied of its difference from *Neottia;* to which it is in habit too strictly allied, in our opinion, to be separated by the character above-mentioned.

Our *N. pubescens*, n. 17, is another species of Mr. Brown's *Goodyera.*

LISTERA. Tway-blade.

Brown in Ait. Hort. Kew. v. 5. 201.

Eff. Ch. Calyx spreading. Nectary without a spur, not embraced by the calyx. Petals spreading. Column without a border.

A very distinct genus, separated from the *Ophrys* of Linnæus, and from the *Epipactis* of Swartz and his followers. (See EPIPACTIS, n. 10 and 11.) This genus is named in memory of Dr. Martin Lister, the celebrated conchologist, whose papers in the Philosophical Transactions, relating to the vascular system of plants, and the seeds of mushrooms, entitle him to botanical commemoration.

1. L. *ovata*, common. 22. 1548. (Ophrys ovata.) Woods and thickets. Per. 6.
2. L. *cordata*, heart-leaved. 5. 358. (Ophrys cordata.) Mountain heaths. Per. 7.

Section 3.

EPIPACTIS. Helleborine.

Eff. Ch. Anther permanent. Nectary tumid underneath, contracted in the middle. See EPIPACTIS.

1. E. *latifolia*, broad-leaved. 4. 269. (Serapias latifolia.) Mountainous woods. Per. 7, 8.
2. E. *palustris*, marsh. 4. 270. (Serap. palustris.) Boggy meadows. Per. 7, 8.
3. E. *grandiflora*, white. 4. 271. (Serap. grandifl.) Chalky woods. Per. 6.
4. E. *ensifolia*, narrow-leaved. 7. 494. (Serap. ensif.) Mountain woods. Per. 6.
5. E. *rubra*, purple. 7. 437. (Serap. rubra.) Mountain woods, rare. Per. 6.
6. E. *Nidus avis*, bird's nest. 1. 48. (Ophrys Nidus avis.) Chalky woods. Per. 6.

MALAXIS. Tender Tway-blade.

Eff. Ch. Anther deciduous. Nectary undivided, sessile, flat underneath. Petals spreading. See MALAXIS.

It seems best not to make the reversed position of the flower, an essential part of the generic character.

1. M. *paludosa*, marsh. 1. 72. Turfy bogs. Per. 7.
2. M. *Loeselii*, lily-leaved. 1. 47. (Ophrys Loeselii.) Sandy bogs. Per. 7.

CORALLORRHIZA. Coral-root.

Eff. Ch. Anther deciduous. Nectary elongated underneath. Petals spreading. Column unconnected.

1. C. *innata*, spur-less. 22. 1547. (Ophrys corallorr.) Boggy woods. Per. 7.

Spur of the nectary short, combined with the germen. Root very much branched.

This interesting and rare little plant has hitherto been found in Scotland only, of the British dominions. Roots sent in moss from Edinburgh, by Mr. E. J. Maughan, blossomed in our garden. These are of a fleshy substance, much branched and divaricated, spreading horizontally; they still exhale, after having been seven years dried, a very sweet smell, like Vanilla. The slender *stem*, a span high, is invested with a few *sheaths*, but destitute of *leaves*, and bears a loose spike of a few small yellowish *flowers*. Mr. Brown, who has finally established this genus, detected the minute and concealed spur. We have a number of exotic species, especially from the East Indies, which seem to belong to Corallorrhiza. Their fleshy tuberous *roots*, and leafless scaly *stems*, are peculiar; and, like other species from North America, some of these plants have an evident spur, others an obsolete or concealed one.

Ord. 2. *Diandria.*

CYPRIPEDIUM. Ladies'-slipper.

Eff. Ch. Calyx spreading. Petals spreading. Nectary inflated. Column with a posterior appendage.

1. C. *Calceolus*, common. 1. 1. Northern woods, rare. Per. 6.

Stem leafy. Appendage of the column elliptical, obtuse, channelled. Petals flat.

The figure in Engl. Bot. unfortunately represents the appendage as if angular and acute; insomuch that it has been supposed to have been drawn from an American species, known by that character; but this supposition is refuted by a comparison of the plants. (See CYPRIPEDIUM.) The *calyx*, as we deem it, of this genus is considered by authors as composed of three leaves, like all the rest of the *Orchideæ;* though the two lowermost are, for the most part, nearly united into one.

Ord. 3. *Hexandria.*

ARISTOLOCHIA. Birthwort.

1. A. *Clematitis*, common. 6. 398. Thickets and rubbish. Per. 7, 8.

Class

Clafs 21. Monoecia.

Ord. 1. *Monandria.*

Zannichellia. Horned Pondweed.

1. Z. *paluftris*, common. 26. 1844. Ditches and pools. Ann. 7.

Ord. 2. *Triandria.*

Typha. Reed-mace.

1. T. *latifolia*, great. 21. 1455. Pools and ditches. Per. 7.
2. T. *anguftifolia*, leffer. 21. 1456. Pools, rare. Per. 6, 7.
3. T. *minor*, dwarf. 21. 1457. Marfhes, rare. Per. 7.

Sparganium. Bur-reed.

1. S. *ramofum*, branched. 11. 744. Rivers and ditches. Per. 7, 8.
2. S. *fimplex*, unbranched. 11. 745. Waters, on gravel. Per. 7, 8.
3. S. *natans*, floating. 4. 273. Rivers and pools. Per. 7.

Carex. Sedge.

1. C. *dioica*, common feparate-headed. 8. 543. Bogs. Per. 5, 6.
2. C. *Davalliana*, prickly feparate-headed. 30. 2123. Marfhes. Per. 5, 6.
3. C. *pulicaris*, flea. 15. 1051. Marfhes. Per. 6.
4. C. *pauciflora*, few-flowered. 29. 2041. Alpine bogs. Per. 6.
5. C. *ftellulata*, little prickly. 12. 806. Marfhes. Per. 5, 6.
6. C. *curta*, white. 20. 1386. Watery places, rare. Per. 6.
7. C. *elongata*, elongated. 27. 1920. Marfhes, Yorkfhire. Per. 6.
8. C. *ovalis*, oval-fpiked. 5. 306. Marfhes. Per. 6.
9. C. *remota*, remote. 12. 832. Moift groves. Per. 5, 6.
10. C. *axillaris*, axillary cluftered. 14. 993. Bogs, rare. Per. 5, 6.
11. C. *incurva*, curved. 13. 927. Sandy mouths of rivers, rare. Per. 7, 8.
12. C. *arenaria*, fea. 13. 928. Sandy coaft, abundantly. Per. 6.
13. C. *intermedia*, foft brown. 29. 2042. Marfhes. Per. 5, 6.
14. C. *divifa*, bracteated marfh. 16. 1096. Salt marfhes. Per. 5, 6.
15. C. *muricata*, greater prickly. 16. 1097. Moift meadows. Per. 5, 6.
16. C. *divulfa*, grey. 9. 629. Moift fhady places. Per. 5.
17. C. *vulpina*, great fpiked. 5. 307. Marfhes. Per. 5.
18. C. *teretiufcula*, leffer panicled. 15. 1065. Marfhes. Per. 5.
19. C. *paniculata*, great panicled. 15. 1064. Bogs. Per. 6.
20. C. *digitata*, fingered. 9. 615. Woods, on limeftone. Per. 5.
21. C. *clandeftina*, dwarf filvery. 30. 2124. Sunny rocks. Per. 5.
22. C. *pendula*, great pendulous. 33. 2315. Moift hedges. Per. 5, 6.
23. C. *ftrigofa*, loofe pendulous. 14. 994. Groves. Per. 4, 5.
24. C. *fylvatica*, pendulous wood. 14. 995. Woods, frequent. Per. 5, 6.
25. C. *depauperata*, ftarved wood. 16. 1098. Woods, rare. Per. 5, 6.
26. C. *Mielichoferi*, loofe-fpiked rock. 32. 2293. Alpine rocks. Per. 8.

Sheaths not half the length of the flower-ftalk. Female fpikes three, diftant, erect, lax and flender. Fruit ovate, triangular, bluntly cloven, twice the length of the obtufe fcale.

Willdenow, in Sp. Pl. v. 4. 276, gives a citation of Schkuhr's *Carices*, fig. 198, and adds that this is Hoppe's *C. alpina*. It has however nothing to do with *alpina* of Wahlenberg; fee Carex, n. 97.

27. C. *capillaris*, capillary. 29. 2069. Highland mountains. Per. 7, 8.
28. C. *rariflora*, loofe alpine. 35. 2516. Lofty Highland mountains. Per. 7.

Sheaths extremely fhort. Female fpikes nearly linear, pendulous; their fcales loofely imbricated. Fruit obovate, with three blunt angles and depreffed fides. Root creeping.

Wahlenberg makes this a variety of *limofa*, n. 30, with which it agrees in the creeping *root*, fhort *fheaths*, and drooping female *fpikes;* but differs in its obovate, triangular, (not broad and compreffed), *fruit;* much fmaller fize; and lax blacker *fcales.*

29. C. *Pfeudo-cyperus*, baftard-cyperus. 4. 242. Marfhes. Per. 6.
30. C. *limofa*, green and gold. 29. 2043. Spongy boggy pools. Per. 6.
31. C. *uftulata*, fcorched alpine. 34. 2404. Alpine rivulets. Per. 7. See Carex, n. 127.
32. C. *atrata*, black. 29. 2044. Alpine meadows. Per. 6, 7.
33. C. *pulla*, ruffet. 29. 2045. Alpine paftures. Per. 7.
34. C. *pallefcens*, pale. 31. 2185. Meadows and groves. Per. 5, 6.
35. C. *flava*, yellow. 18. 1294. Marfhes. Per. 5, 6.
36. C. *fulva*, tawny. 18. 1295. Marfhes. Per. 6, 7.
37. C. *Oederi*, Oederian. 25. 1773. Moift meadows. Per. 7.
38. C. *extenfa*, long-bracteated. 12. 833. Sea-coaft. Per. 6.
39. C. *diftans*, loofe. 18. 1234. Marfhes. Per. 6.
40. C. *binervis*, green-ribbed. 18. 1235. Dry heaths. Per. 6.
41. C. *præcox*, vernal. 16. 1099. Open paftures, common. Per. 4.
42. C. *pilulifera*, round-headed. 13. 885. Paftures and heaths. Per. 4, 5.
43. C. *tomentofa*, downy-fruited. 29. 2046. Meadows, rare. Per. 6.
44. C. *rigida*, rigid. 29. 2047. Lofty mountains. Per. 6, 7.
45. C. *panicea*, pink-leaved. 21. 1505. Moift meadows. Per. 5, 6.
46. C. *recurva*, glaucous heath. 21. 1506. Paftures and heaths. Per. 5, 6.

C. Micheliana, Fl. Brit. 1004. E. B. 32. 2236, is now found to be only a variety of *recurva*, with fmooth fruit, and feveral male fpikes.

47. C. *cæfpitofa*, tufted bog. 21. 1507. Marfhes. Per. 5.
48. C. *ftricta*, glaucous ftraight-leaved. 13. 914. Marfhes. Per. 4.

49. C. *acuta*, ſlender-ſpiked. 9. 580. Watery places. Per. 5.
50. C. *paludoſa*, leſſer common. 12. 807. Watery places. Per. 5.
51. C. *riparia*, great common. 9. 579. Watery places. Per. 4, 5.
52. C. *lævigata*, ſmooth-ſtalked beaked. 20. 1387. Bogs. Per. 5.
53. C. *veſicaria*, ſhort-ſpiked bladder. 11. 779. Marſhes. Per. 5.
54. C. *ampullacea*, ſlender-beaked bladder. 11. 780. Bogs. Per. 5.
55. C. *hirta*, hairy. 10. 685. Boggy meadows. Per. 5, 6.
56. C. *filiformis*, ſlender-leaved. 13. 904. Bogs, rare. Per. 6.

KOBRESIA. Kobreſia.

1. K. *caricina*, ſedgy. 20. 1410. Moiſt mountains. Per. 8.

ERIOCAULON. Pipewort.

1. E. *ſeptangulare*, jointed. 11. 733. Lakes, Scotland and Ireland. Per. 9.

Ord. 3. *Tetrandria.*

LITTORELLA. Shore-weed.

1. L. *lacuſtris*, plantain. 7. 468. Sandy puddles. Per. 6.

BETULA. Birch.

1. B. *alba*, common. 31. 2198. Sandy or mountain woods. Tree. 4, 5.
2. B. *nana*, dwarf. 33. 2326. Boggy mountain heaths. Shrub. 5.
3. B. *Alnus*, alder. 21. 1508. Watery meadows. Tree. 3.

BUXUS. Box.

1. B. *ſempervirens*, common. 19. 1341. Chalky hills. Shrub. 4.

URTICA. Nettle.

1. U. *pilulifera*, Roman. 3. 148. Rubbiſh on the coaſt. Ann. 6, 7.
2. U. *urens*, ſmall. 18. 1236. Cultivated ground. Ann. 6—10.
3. U. *dioica*, great. 25. 1750. Waſte ground. Per. 7, 8.

Ord. 4. *Pentandria.*

XANTHIUM. Bur-weed.

1. X. *ſtrumarium*, ſmall burdock. 36. 2544. Dunghills, rare. Ann. 8, 9.

AMARANTHUS. Amaranth.

1. A. *Blitum*, wild. 31. 2212. Dunghills, rare. Ann. 8.

BRYONIA. Bryony.

1. B. *dioica*, red-berried. 7. 439. Hedges. Per. 5—9.

Ord. 5. *Polyandria.*

CERATOPHYLLUM. Hornwort.

1. C. *demerſum*, common. 14. 947. Ditches, frequent. Per. 8, 9.
2. C. *ſubmerſum*, unarmed. 10. 679. Ditches, rare. Per. 9.

MYRIOPHYLLUM. Water-millfoil.

1. M. *ſpicatum*, ſpiked. 2. 83. Ditches and ponds. Per. 7, 8.
2. M. *verticillatum*, whorled. 4. 218. Ponds, rare. Per. 7.

SAGITTARIA. Arrow-head.

1. S. *ſagittifolia*, common. 2. 84. Rivers and ditches. Per. 7, 8.

ARUM. Cuckow-pint.

1. A. *maculatum*, ſpotted. 19. 1298. Thickets and woods. Per. 5.

POTERIUM. Garden-Burnet.

1. P. *Sanguiſorba*, common. 12. 860. Chalky hills. Per. 7.

QUERCUS. Oak.

1. Q. *Robur*, common Britiſh. 19. 1342. Woods and hedges. Tree. 4.
2. Q. *ſeſſiliflora*, ſeſſile-fruited. 26. 1845. Woods. Tree. 4, 5.

FAGUS. Beech.

1. F. *Caſtanea*, ſweet cheſnut. 13. 886. Woods. Tree. 5.
2. F. *ſylvatica*, common. 26. 1846. Chalky hills. Tree. 4, 5.

CARPINUS. Horn-beam.

1. C. *Betulus*, common. 29. 2032. Woods, on clay. Tree. 5.

CORYLUS. Nut.

1. C. *Avellana*, haſel. 11. 723. Woods and hedges. Small tree. 3, 4.

Ord. 6. *Monadelphia.*

PINUS. Fir.

1. P. *ſylveſtris*, common Scotch. 35. 2460. Scottiſh hills. Tree. 5.

Claſs 22. DIOECIA.

Ord. 1. *Diandria.*

SALIX. Willow.

1. S. *purpurea*, bitter purple. 20. 1388. Marſhes, rare. Shrub. 3.
2. S. *Helix*, roſe. 19. 1343. Marſhes. Small tree. 3, 4.
3. S. *Lambertiana*, Boyton. 19. 1359. Banks of rivers. Small tree. 3, 4.
4. S. *Forbiana*, baſket oſier. 19. 1344. Oſier holts. Shrub. 4.
5. S. *rubra*, green oſier. 16. 1145. Oſier holts. Small tree. 4, 5.
6. S. *Croweana*, broad-leaved monadelphous. 16. 1146. Marſhes. Small tree. 4, 5.
7. S. *triandra*, long-leaved triandrous. 20. 1435. Meadows. Tree. 5 and 8.
8. S. *lanceolata*, ſharp-leaved triandrous. 20. 1436. Meadows. Tree. 4, 5.
9. S. *amygdalina*, almond-leaved. 27. 1936. Marſhes. Tree. 4, 5.

10. S. *decipiens*, varnifhed. 27. 1936. Woods and hedges. Tree. 5.
11. S. *Ruffelliana*, Bedford. 26. 1808. Woods and meadows. Tall tree. 4, 5.
12. S. *fragilis*, crack. 26. 1807. Meadows and marfhes. Tree. 4, 5.
13. S. *pentandra*, bay-leaved. 26. 1805. Banks of rivers. Tree. 5, 6.
14. S. *nigricans*, dark broad-leaved. 17. 1213. Meadows. Small tree. 4.
15. S. *bicolor*, fhining dark-green. 26. 1806. Woods. Shrub. 4, 5.
†16. S. *petiolaris*, dark long-leaved. 16. 1147. Marfhes. Shrub. 4.
17. S. *phylicifolia*, tea-leaved. 28. 1958. Highlands of Scotland. Shrub. 5.

S. radicans, Fl. Brit. 1053, proves to be the fame fpecies.

18. S. *Arbufcula*, little tree. 19. 1366. Mountains of Scotland. Shrub. 4.
19. S. *vitellina*, yellow. 20. 1389. Marfhy meadows. Tree. 5.
20. S. *tenuifolia*, thin-leaved. 31. 2186. Stony hills. Shrub. 5, 6.
21. S. *malifolia*, apple-leaved. 23. 1617. Hills? Shrub. 5.
22. S. *myrfinites*, green whortle-leaved. 19. 1360. Highlands. Shrub. 5, 6.
23. S. *prunifolia*, plum-leaved. 19. 1361. Highlands. Shrub. 4, 5.
24. S. *venulofa*, veiny-leaved. 19. 1362. Highlands. Shrub. 4, 5.
25. S. *vacciniifolia*, bilberry-leaved. 33. 2341. Scotland. Shrub. 4.
26. S. *carinata*, folded-leaved. 19. 1363. Highlands. Shrub. 4.
27. S. *Dickfoniana*, broad-leaved mountain. 20. 1390. Highlands. Shrub. 4.

S. myrtilloides, Fl. Brit. 1056, but not of Linnæus.

28. S. *herbacea*, leaft. 27. 1907. Micaceous mountains. Small fhrub. 6.
29. S. *reticulata*, wrinkled. 27. 1908. Highlands. Small fhrub. 6.
30. S. *arenaria*, downy mountain. 26. 1809. Highlands. Shrub. 5.
31. S. *glauca*, glaucous mountain. 26. 1810. Highlands. Shrub. 5.
32. S. *Stuartiana*, fhaggy mountain. 36. 2586. Highlands. Shrub. 7.
33. S. *argentea*, filky fand. 19. 1364. Sandy fea-coaft. Shrub. 5.
34. S. *proftrata*, proftrate dwarf. 28. 1959. Moift hills. Small fhrub. 5, 6.
35. S. *fufca*, brownifh dwarf. 28. 1960. Mountainous heaths. Small fhrub. 5.
36. S. *parvifolia*, fmall-leaved dwarf. 28. 1961. Moift meadows. Shrub. 5.
37. S. *adfcendens*, afcending dwarf. 28. 1962. Moift heaths. Shrub. 5.
38. S. *repens*, creeping dwarf. 3. 183. Sandy moift heaths. Small fhrub. 5.
39. S. *rofmarinifolia*, rofemary-leaved. 19. 1365. Moift fand. Shrub. 4, 5.
40. S. *cinerea*, grey. 27. 1897. Woods. Small tree. 5.
41. S. *aurita*, round-eared fallow. 21. 1487. Woods. Shrub. 4, 5.
42. S. *aquatica*, common water fallow. 20. 1437. Wet thickets. Small tree. 4.
43. S. *oleifolia*, olive-leaved fallow. 20. 1402. Woods and hedges. Tree. 3.
44. S. *rupeftris*, filky rock. 33. 2342. Highland rocks. Small fhrub. 4.
45. S. *Anderfoniana*, green mountain fallow. 33. 2343. Scotland. Shrub. 5.
46. S. *Forfteriana*, glaucous mountain fallow. 33. 2344. Scotland. Small tree. 5.
47. S. *cotinifolia*, quince-leaved. 20. 1403. Woods. Shrub. 4.
48. S. *hirta*, hairy branched. 20. 1404. Woods. Small tree. 4, 5.
49. S. *fphacelata*, withered-pointed. 33. 2333. Scotland. Tree. 4, 5.
50. S. *caprea*, great round-leaved fallow. 21. 1488. Dry woods. Tree. 4.
51. S. *acuminata*, long-leaved fallow. 20. 1434. Moift woods. Tree. 4.
52. S. *ftipularis*, auricled ofier. 17. 1214. Ofier holts. Tree. 3.
53. S. *molliffima*, velvet ofier. 21. 1509. Ofier holts. Small tree. 4.
54. S. *viminalis*, common ofier. 27. 1898. Ofier holts, &c. Tree. 4, 5.
55. S. *alba*, common white. 34. 2430. Woods and meadows. Tree. 4, 5.
56. S. *cærulea*, blue. 34. 2431. Moift meadows. Large tree. 5.

Ord. 2. *Triandria*.

EMPETRUM. Crake-berry.

1. E. *nigrum*, black. 8. 526. Mountain moors. Small fhrub. 5.

RUSCUS. Butcher's-broom.

1. R. *aculeatus*, common. 8. 560. Woods and thickets. Per. 3, 4.

Ord. 3. *Tetrandria*.

VISCUM. Miffeltoe.

1. V. *album*, white. 21. 1470. On trees. Small fhrub. 5.

HIPPOPHÄE. Sallow-thorn.

1. H. *rhamnoides*, fea. 6. 425. Sandy cliffs. Small tree. 5.

MYRICA. Gale.

1. M. *Gale*, fweet. 8. 562. Spongy bogs. Shrub. 5.

Ord. 4. *Pentandria*.

HUMULUS. Hop.

1. H. *Lupulus*, common. 6. 427. Thickets and hedges. Per. 7.

Ord. 5. *Hexandria*.

TAMUS. Black-bryony.

1. T. *communis*, common. 2. 91. Woods and hedges. Per. 6.

Ord. 6. *Octandria.*

POPULUS. Poplar.

1. P. *alba*, white. 23. 1618. Moist woods, or hills. Tree. 3.
2. P. *canescens*, grey. 23. 1619. Watery meadows. Tree. 3.
3. P. *tremula*, aspen. 27. 1909. Boggy woods. Tree. 3, 4.
4. P. *nigra*, black. 27. 1910. Watery weadows. Tree. 3.

RHODIOLA. Rose-root.

1. R. *rosea*, mountain. 8. 508. Alpine rocks. Per. 5, 6.

Ord. 7. *Enneandria.*

MERCURIALIS. Mercury.

1. M. *perennis*, perennial. 26. 1872. Groves and thickets. Per. 4, 5.
2. M. *annua*, annual. 8. 559. Rubbish. Ann. 7—9.

HYDROCHARIS. Frog-bit.

1. H. *Morsus ranæ*, common. 12. 808. Ditches. Per. 7.

Ord. 8. *Monadelphia.*

JUNIPERUS. Juniper.

1. J. *communis*, common. 16. 1100. Chalky downs. Shrub. 5.

TAXUS. Yew.

1. T. *baccata*, common. 11. 746. Woods and rocks. Tree. 3, 4.

Class 23. POLYGAMIA.

Ord. 1. *Monoecia.*

ATRIPLEX. Orache.

1. A. *portulacoides*, shrubby. 4. 261. Muddy sea-coast. Small shrub. 7, 8.
2. A. *laciniata*, frosted sea. 3. 165. Sandy coast. Ann. 7.
3. A. *patula*, spreading halberd-leaved. 13. 936. Rubbish. Ann. 6—8.
4. A. *angustifolia*, spreading narrow-leaved. 25. 1774. Rubbish. Ann. 6—8.
5. A. *erecta*, upright spear-leaved. 31. 2223. Fields, rare. Ann. 8.
6. A. *littoralis*, grass-leaved sea. 10. 708. Muddy coast. Ann. 8, 9.
7. A. *pedunculata*, stalked sea. 4. 232. Muddy coast, rare. Ann 8, 9.

Pallas in his Travels, English edition v. 1. 291, calls this last species *Ceratocarpus salinus*.

Class 24. CRYPTOGAMIA.

Ord. 1. *Filices.*

EQUISETUM. Horse-tail.

Seven species, chiefly found in moist or watery places. Perennial. 4—8.

BOTRYCHIUM. Moon-wort.

Swartz Syn. Fil. 8.

Eff. Ch. Capsules without a ring, globose, even, sessile on a compound flattened stalk.

1. B. *Lunaria*, common. 5. 318. (Osmunda Lunaria). Pastures. Per. 6.

Frond pinnate, flowering from its base; leaflets crescent-shaped, crenate.

A span high, smooth, pale green, simply pinnate, with about six pair of *leaflets*, and one branched *spike*.

OSMUNDA. Osmund-royal.

1. O. *regalis*, common. 3. 209. Shady bogs. Per. 6, 7.

LYCOPODIUM. Club-moss.

Six species. Heathy mountainous places. Per. 6—8.

POLYPODIUM. Polypody.

Four species. Walls or dry hills. Per. 5—10.

ASPIDIUM. Shield-fern.

Twelve species. Rocks, heaths, bogs, or shady places. Per. 5—7.

This genus differs from *Polypodium*, only in having a membranous *involucrum* to the dots of fructification. See POLYPODIUM.

ASPLENIUM. Spleenwort.

Eight species. Rocks or walls. Per. 3—10.

SCOLOPENDRIUM. Hart's-tongue.

1. S. *vulgare*, common. 16. 1150. Moist shady places. Per. 7.
2. S. *Ceterach*, scaly. 18. 1244. Rocks and walls. Per. 4—10.

BLECHNUM. Blechnum.

1. B. *boreale*, northern. 17. 1159. Dry stony heaths. Per. 7.

PTERIS. Brake.

1. P. *aquilina*, common. 24. 1679. Pastures and woods. Per. 7.
2. P. *crispa*, rock. 17. 1160. Stony hills in the north. Per. 7.

ADIANTUM. Maiden-hair.

1. A. *Capillus-Veneris*, true. 22. 1564. Marine rocks, rare. Per. 5—9.

CYATHEA. Cup-fern.

Three species. Rocks or walls. Per. 6. 7.

WOODSIA. Bristle-fern.

Brown Tr. of Linn. Soc. v. 11. 170. *t.* 11.

1. W. *hyperborea*, alpine. 29. 2023. (Polypodium hyperboreum.) Rocks. Per. 6.

TRICHOMANES. Hair-fern.

1. T. *brevisetum*, short-bristled. 20. 1417. (Hymenophyllum alatum.) Wet rocks in Yorkshire and Ireland, rare. Per. 5, 6.

HYMENOPHYLLUM. Filmy-fern.

1. H. *Tunbridgense*, Tunbridge. 3. 162. Moist rocks. Per. 5, 6.

PILULARIA. Pillwort.

1. P. *globulifera*, pepper-grass. 8. 521. Moist heaths. Per. 6, 7.

Isoetes. Quillwort.

1. I. *lacuftris*, mountain. 16. 1084. Alpine lakes. Per. 5, 6.

Ord. 2. *Mufci.*

Sphagnum. Bog-mofs.

Four fpecies. Clear watery bogs. Per. 6.

Buxbaumia. Buxbaumia.

1. B. *aphylla*, naked-ftalked. 23. 1596. Barren heaths, rare. Ann. 12—2.
2. B. *foliofa*, leafy. 5. 329. Shady rocks. Ann. 7.

Phascum. Earth-mofs.

Seventeen fpecies. Banks, heaths and woods. Ann. 3—5.

Gymnostomum. Beardlefs mofs.

Twenty fpecies. Banks, rocks, and mountains. Ann. or per. 3—8.

Splachnum. Gland-mofs.

Thirteen fpecies. Mountains or bogs, on dung. Ann. 5, 6.

Andræa. Andræa.

Fl. Brit. 1178. *Hooker Tr. of Linn. Soc. v.* 10. 381. See Andreæ, John.

Eff. Ch. Capfule oblong, of four valves, whofe points adhere to the lid. Fringe none.

1. A. *rupeftris*, dufky rock. 18. 1277. Moift alpine rocks. Per. 6.

Leaves lanceolate, keeled, fickle-fhaped, leaning one way, without a rib.

2. A. *Rothii*, black mountain. 31. 2162. Dry rocks. Per. 6.

Leaves lanceolate, keeled, fickle-fhaped, with a mid-rib, leaning one way. Sheath-fcales without a rib.

3. A. *alpina*, chocolate alpine. 18. 1278. Alpine rocks. Per. 6.

Leaves ovate-oblong, concave, riblefs, imbricated every way.

4. A. *nivalis*, tall flender. 33. 2334. Lofty alpine rocks. Per. 6.

Leaves loofely imbricated, lanceolate, curved towards one fide, fingle-ribbed, as well as the fheath-fcales.

This laft is three inches, or more, in height, being much taller, and more branched, than any of the reft. The character of the genus was totally miftaken by Hedwig and others, the valves of the capfule being fuppofed the fringe, till Mr. W. J. Hooker corrected the character, as above. See Fringe *of Moffes*.

Tetraphis. Four-toothed-mofs.

1. T. *pellucida*, tranfparent. 15. 1020. Wet fhady places. Ann. 3, 4.

Capfule cylindrical. Leaves ovate, acute, fingle-ribbed.

2. T. *ovata*, dufky. 22. 1422. (Grimmia Browniana.) Sand rocks. Ann. 3.

Capfule ovate. Radical leaves ftrap-fhaped, obtufe, riblefs.

Great diverfity of opinion has exifted refpecting the genus of this mofs, referred to *Orthotrichum* in Fl. Brit. 1269, and incorrectly drawn, as to the fringe, in Engl. Bot. A German botanift, named Funk, has fhewn that part to confift of four teeth only. This fpecies muft be allowed to accord very ill in habit with the firft.

Encalypta. Extinguifher-mofs.

Five fpecies. Banks and rocks. Per. 3—8.

Grimmia. Grimmia.

Thirty-one fpecies. Banks, rocks, and trees. Moftly per. 4—7.

From thefe is to be deducted *G. Forfteri*, 31. 2225, as being the fame with *Mnium conoideum*. See Grimmia and Mnium.

Dicranum. Fork-mofs.

Forty-eight fpecies. Woods, hills and bogs. Moftly per. 4—8.

From this genus, as it ftands in Fl. Brit., four fpecies are to be deducted; *calliftomum*, n. 15, as being the fame with *rigidulum*, Engl. Bot. 20. 1439; *pulvinatum*, n. 21, removed to *Grimmia*, 24. 1728; *fciuroides*, n. 22, removed to *Pterogonium*, 27. 1903; and *viridiffimum*, n. 34, removed to *Gymnoftomum*, 22. 1583. Their place is fupplied by four others; *Bruntoni*, 35. 2509; *Starkii*, 31. 2227; *latifolium*, 35. 2492; and *virens*, 31. 1462.

Trichostomum. Fringe-mofs.

Eighteen fpecies. Rocks, heaths or water. Per. 4—8.

T. cirratum, Fl. Brit. n. 6, is to be expunged, as not differing from *Dicranum polyphyllum*, 17. 1217.

Tortula. Screw-mofs.

Nineteen fpecies. Banks, heaths and walls. Per. 3—12.

Orthotrichum. Briftle-mofs.

Eleven fpecies. Trees, wet rocks, &c. Per. 1—4.

O. Brownianum, Fl. Brit. 1269, is *Tetraphis ovata*.

Pterogonium. Wing-mofs.

Six fpecies. Trees and rocks. Per. 4, 5.

We poftpone remarks on this genus till it comes in its proper place. See Pterogonium.

Neckera. Neckera.

Six fpecies. Trees and rocks. Per. 2—4.

Among them is the following very curious mofs, difcovered fince our article Neckera was publifhed.

N. *fplachnoides*. Pear-fruited Neckera. 36. 2564.

Stem branched, fpreading. Leaves lanceolate, pointed, flat, fpreading every way; thofe of the fheath fix, in two rows. Fruit-ftalk granulated above. Capfule erect, contracted at the bafe. Veil fringed.

Found by Dr. Taylor on the Secawn mountain near Dublin.

Hypnum. Feather-mofs.

Eighty-one fpecies. Trees, rocks and bogs. Per. 2—10.

From the 77 fpecies in Fl. Brit. are to be removed *lucens*, n. 25, which is *Hookeria lucens*; and *filamentofum*, n. 42, which has been fhewn by Dr. Swartz to be the fame as *dubium*, n. 74. Six are added in their ftead; *pratenfum*, Turn. Mufc. Hib. 161; *filefianum*, Engl. Bot. 28. 2016; *Thuringicum*, Turn. Mufc. Hib. 181; *fquarrofulum*, 24. 1709; *fallax*, 30. 2127; and *Crifta-caftrenfis*, 30. 2108.

Hookeria. Hookeria.

1. H. *lucens*, fhining. 27. 1902. Shady bogs. Per. 4—7.

FONTINALIS. Water-mofs.

Three fpecies. Running waters. Per. 7, 8.

FUNARIA. Cord-mofs.

1. F. *hygrometrica*, twifting. 5. 342. (Bryum hygrometricum). Sandy ground. Ann. 4, 5.

Stem none. Leaves concave, converging, entire, acute. Capfule obovate. Lid convex.

2. F. *Muhlenbergii*, hair-pointed. 21. 1497. Mountain heaths. Ann. 4, 5.

Stem fhort, fimple. Leaves concave, finely ferrated, hair-pointed. Capfule oblique. Lid flightly conical.

3. F. *Templetoni*, long-fruited. 36. 2524. Ireland. Per. 5?

Stem elongated, fomewhat branched. Leaves fpreading, ovate, entire, acute. Capfule obovate, tapering at the bafe.

BARTRAMIA. Bartramia.

Eff. Ch. Capfule fpherical, at length furrowed. Outer fringe of 16 tapering teeth; inner a plaited membrane.

The original *Bartramia* being referred to *Triumfetta*, this genus of moffes has been dedicated to the memory of Mr. John Bartram, the venerable correfpondent of Linnæus, Collinfon, Fothergill and other naturalifts, who during his travels in North America, contributed greatly to enrich the gardens and mufeums of Europe. See the end of the article BRYUM. We here fubjoin a more ample lift of Britifh fpecies.

1. B. *Halleriana*, lateral. 14. 997. Mountain rivulets. Per. 6, 7.

Fruit-ftalks lateral, curved, fhorter than the linear-awl-fhaped, fingle-ribbed, even leaves.

2. B. *pomiformis*, apple. 14. 998. Shady rocks and banks. Per. 4, 5.

Fruit-ftalks erect, furmounting the ftems. Leaves awl-fhaped, fingle-ribbed.

3. B. *crifpa*, frizzled. 22. 1526. Northumberland. Per. 4, 5.

Fruit-ftalks erect, furmounting the ftems. Leaves linear-awlfhaped, broad at the bafe, curled when dry. Capfule rather oblique. Lid obtufely conical.

4. B. *ithyphylla*, ftraight-leaved. 24. 1710. Wales and north of England. Per. 5.

Fruit-ftalks furmounting the ftems. Leaves capillary, with a very broad bafe, entire; very ftraight when dry.

5. B. *gracilis*, tall flender. 26. 1826. Highlands. Per. 7, 8.

Fruit-ftalks erect, furmounting the ftems. Leaves lanceolate, revolute, fingle-ribbed; ferrated towards the point. Stems elongated.

6. B. *fontana*, fountain. 6. 390. (Bryum fontanum). Boggy mountains. Per. 6, 8.

Fruit-ftalks erect, much taller than the cluftered, erect, thread-fhaped branches. Leaves ovate, entire.

7. B. *marchica*, bog. 29. 2074. Highland water-falls. Per.

Fruit-ftalks erect, taller than the ftems. Leaves lanceolate, finely ferrated, imbricated in five rows. Branches cluftered, flender, upright.

8. B. *arcuata*, curve-ftalked. 18. 1237. Mountain bogs, rare. Per. 7.

Fruit-ftalks recurved. Leaves lanceolate, furrowed, finely ferrated. Branches fcattered, fpreading.

MNIUM. Spring-mofs.

1. M. *androgynum*, narrow-leaved. 18. 1238. Shady wet places. Per. 3, 4.

2. M. *cinclidium*, club-fruited. 18. 1239. Trees. Per.

3. M. *paluftre*, greater forked. 6. 391. (Bryum paluftre.) Bogs. Per. 5—7.

BRYUM. Thread-mofs.

Thirty-four fpecies. Heaths, bogs, mountains. Moftly per. 3—9.

A full account of the thirty-three fpecies of Fl. Brit. is given by our excellent predeceffor, the Rev. Mr. Wood; fee BRYUM. From thefe we have only to remove the *inclinans*, n. 23, which Mr. F. Eagle has difcovered to be no other than *Dicranum virens*, E. B. 21. 1462.—*B. cylindricum*, n. 6, is *longicollum*, Swartz Mufc. Suec. 49. t. 6. f. 13. *Webera longicolla* of Hedwig.—*B. marginatum*, n. 20, is *ferratum*, Schrad. Spicil. 71. Two fpecies are to be added.

B. *triquetrum*, long ftalked. 34. 2394. Bogs, Ireland. Per. 7.

Stem fubdivided. Branches fimple, erect. Leaves fpreading in three rows, ovato-lanceolate, fharp-pointed, finely ferrated. Capfule flender-pear-fhaped, oblique and incurved. Lid conical. The *fruitftalks* exceed all other Britifh moffes in length, extending to three or four inches.

B. *obtufifolium*, blunt-leaved. Turn. Mufc. Hib. 116. t. 11, f. 1. Ireland.

"Stem nearly fimple. Leaves ovate, obtufe, concave, converging. Capfule obovate, oblique. Lid boffed." This is one of the very few moffes of which fpecimens have not yet been procured for delineation in *Engl. Bot.*

POLYTRICHUM. Hair-mofs.

Sixteen fpecies. Heaths and mountains. Per. or ann. 3—8. See POLYTRICHUM hereafter.

Ord. 3. *Hepaticæ.*

JUNGERMANNIA. Jungermannia.

Above feventy fpecies, now illuftrating by Mr. W. J. Hooker, in an elegant and learned monograph. Sixty-eight are figured in *Engl. Bot.*

BLASIA. Blafia.

1. B. *pufilla*, dwarf. 19. 1328. Damp fandy places. Ann. 10, 11.

TARGIONIA. Targionia.

1. T. *hypophylla*, dotted. 4. 287. Shady banks, rare. Per. 3, 4.

SPHÆROCARPUS. Bladder-grain.

1. P. *terreftris*, reticulated. 5. 299. Turnip and clover fields. Ann. 11.

MARCHANTIA. Marchantia.

Five fpecies. Shady places, or rocks. Per. Various feafons.

RICCIA. Riccia.

Four fpecies. Sandy heaths, or in ponds. Ann? 8—12.

R. fruticulofa is a *Jungermannia*, probably not diftinct from *furcata*. See E. B. 35. 2514.

ANTHOCEROS. Horn Liverwort.

1. A. *punctatus*, jagged-leaved. 22. 1537. Damp fandy ground. Ann. 6.

2. A.

2. A. *major*, broad-leaved. 22. 1538. With the former. Ann. 6.

A. lævis of Linnæus, who erroneoufly fuppofed it had no warts, or male flowers.

3. A. *multifidus*, fine-cut. Dill. t. 68. f. 4. Highland rocks. *Dickfon.*

Ord. 4. *Algæ.*

This order begins with the natural family of LICHENES; (fee that article.) Of thefe, 391 are figured in *Engl. Bot.*; but feveral ftill remain for further examination. An ample view of numerous fpecies, both native and exotic, may be found under the article LICHEN; and their terminology, phyfiology, and generic diftribution, under LICHENES.

The following, except the firft genus, which is of an amphibious nature, are aquatic, or fubmerfed, *Algæ.*

TREMELLA. Jelly-bladder.

About twenty fpecies, found on rotten wood, in water, or on the ground, after much wet.

ULVA. Laver.

About thirty-five fpecies. In frefh or falt water. Ann. or per. Various feafons.

FUCUS. Fucus.

About ninety fpecies. In falt water. Ann. or per. Various feafons.

RIVULARIA. Rivularia.

Eleven fpecies are figured in Engl. Bot. Frefh or falt water.

CONFERVA. Conferva.

About 180 fpecies. Frefh or falt water, at various feafons. Above 130 are figured in Engl. Bot.

VAUCHERIA. Vaucheria.

Three or four, not very well defined, fpecies, found in frefh water. See Engl. Bot. v. 25.

BYSSUS. Byffus.

Hudfon has nineteen fpecies of this genus, but the number is much leffened in confequence of fubfequent enquiries; infomuch that it is hard to fay what really conftitutes a *Byffus* at all. The fibrous kinds are generally reducible to *Conferva*, the powdery ones to *Lepraria*. Some of the latter indeed, having occafionally produced fhields, prove themfelves either *Lecideæ* or *Parmeliæ*. See LICHENES.

Ord. 5. *Fungi.*

Withering, who excels in this obfcure department of Britifh botany, defcribes about 556 fpecies of *Fungi*, difpofed in feventeen genera. Of thefe *Agaricus*, confifting of 282 fpecies, is the principal. The diftribution of the reft has been fo much altered by following writers, and efpecially by Perfoon, that it would be ufelefs to enter into any details concerning Withering's generic arrangement. The number of known Britifh fpecies is alfo greatly augmented fince his time; fo that perhaps they might be eftimated between 750 and 800. A great part of them are figured in Sowerby and Bolton. This order is purpofely excluded from the *Englifh Botany*, becaufe it would have overloaded the Cryptogamic department of that work. It has met with few votaries, as yet, in this country. In Germany the *Fungi* have received particular attention. See FUNGI.

Thus at the end of the Vegetable, like the Animal, Kingdom, our knowledge vanifhes amongft undiftinguifhable, almoft imperceptible, tribes, whofe confines blend with each other. The imperfection which we proudly attribute to fuch as we cannot underftand, rather belongs to our own limited powers, or to our fuperficial enquiries. The accuracy and minutenefs of inveftigation, amongft naturalifts of the prefent day, fo far tranfcends what was ufual thirty years ago, that the cryptogamic clafs, like the infect tribes, has difplayed a new world, as it were, to the curious enquirer, and has fmoothed the way for fucceeding obfervers; who in their turn need apprehend no deficiency of occupation or entertainment.

PLANTS, in *Agriculture*, vegetable productions, of which there are numerous kinds, fuch as herbs of various forts, comprehending all the different graffes, leguminous vegetables, and efculents of other defcriptions; trees, including thofe of the large or timber kind, and thofe of a more low or fhrubby growth, whether under the name of fhrubs, or under-fhrubs. But properly, in an agricultural point of view, they chiefly comprehend fuch graffes or plants of that nature as are employed as the food of animals, and fuch trees or other plants as are capable of being applied to the purpofes of timber, or made ufe of in the bufinefs of hufbandry. And it may be farther obferved with refpect to plants, that moft of them are hermaphrodite, containing the male and female parts in the fame flower; others have flowers on the fame ftems, fome of which are male, and others female. Some likewife produce flowers over the whole without being followed by any fruit, while others of the fame fort bear fruit with flowers, in confequence of which they are diftinguifhed into male and female plants. There are many of this fort, as the hop, hemp, and the poplar tree. The female flowers are only followed by fruit, the hermaphrodites, in refpect to this, being confidered among the female. Plants are capable of being fecundated from very confiderable diftances, which is a circumftance that the farmer fhould carefully keep in mind in faving the feeds of particular forts of plants, as all the cabbage tribe, and many others.

They require nourifhment and air as well as animals to fupport, and keep them in a proper ftate of healthy growth, the former of which is principally drawn from the earth or the furrounding atmofphere. The gafeous materials are chiefly drawn from the atmofphere by the upper furfaces of their leaves, while the oxygen gas or *pure air* is given out during the fun-fhine by their under furfaces. It is evident, therefore, that the means of fupport are provided in two different ways, by the radical or root fibres of the plant taking up one part and the leaves drinking up another, the former from the earth, and the latter from the air that furrounds them. See FOOD *of Plants*, and MANURE.

Moft of the plants which are the principal objects of agriculture, are either raifed and increafed from the feeds, or the cuttings or other parts of roots, in the fields where they are to grow, as in all the grain and grafs kinds, as well as in the potatoe; but there are a few in which the young plants, or offsets, are made ufe of, being fet out in fomewhat the garden method, and in which great care fhould conftantly be taken that they are good in their kinds, and perfect in their nature and different parts. Thefe are chiefly of the cabbage, madder, and other fimilar kinds.

Wheat plants are likewife fometimes tranfplanted, but the practice is by no means in any degree of a general nature.

In regard to the plants of the tree kind, which are frequently a good deal employed, they are fometimes raifed and provided from the feeds in the places where they are to grow;

grow; and at others reared and procured from the nurfery grounds in the proper ftate for ufe in the forming of woods, plantations, and other forts of wooded lands.

In the practice of planting, experience for a long time has fufficiently fhewn, that where there is any degree of natural fhelter or protection in the fituation, and particularly where the ground has been properly prepared for the purpofe, that fuch plants as have been tranfplanted in the nurfery, and which are from a foot and a half to two or three feet in height, are the moft fuitable to be made ufe of in this intention. And it is directed by Mr. Loudon and others, that in performing the bufinefs, they fhould be placed from four to fix feet diftant from each other, being put into the foil in an irregular manner. But that in expofed fituations and fpots, where fhelter and protection are only to be gained by putting them in in a thick or clofe method, or by that of planting nurfes, tranfplanted plants which are under a foot and a half in height fhould alone be had recourfe to, being planted out from two feet and a half to four feet apart in fuch plantations. The fpace or diftance between the plants in both thefe inftances, muft of neceffity vary very greatly, according to the nature of the kind, and other circumftances. Alfo the borders and margins of large plantations, as well as narrow ftripes and patches, ought to be thicker, or more clofely planted with thofe forts of plants, than the infides of great extents, though in the fame expofures; but, on the contrary, where the ground is of a deep loamy quality, they may be put at wider diftances, than where it is more thin and gravelly in its nature. Likewife in making very extenfive plantations, it frequently becomes a matter of importance in fetting out the plants, to place them in rows, as in this way they may be cultivated with much greater facility when they approach towards the growth of trees. For in many inftances, the neceffary cultivation, by fuch means, can be readily given with advantage by the plough and the horfe-hoe; and not unfrequently different kinds of vegetables and roots may be introduced between the rows with great propriety and benefit, as thofe of the turnip, cabbage, onion, potatoe, carrot, and various other forts.

It is contended that in all common plantations, the plants of thefe defcriptions fhould be put into the ground with fome degree of irregularity; but that wherever ornament is the leaft had in view, it fhould always be done in a manner, *irregularly irregular;* they fhould be grouped, or, in the more plain language of thofe engaged in the bufinefs, planted out juft as if they had grown up by accident from the feed: or in fuch a manner as is feen in natural forefts, where, in fome parts, perhaps two or three trees appear to fpring from one root, and in others quite thin and more detached. As by this means an endlefs variety of compofition is produced, and at the fame time an equal quantity of timber afforded, as the fame would have yielded, if planted out in the moft regular manner in refpect to the diftances. In proof of the truth of which, the above writer has adduced the common mode of thinning fields of young turnip plants, that have not fprung fufficiently thick. Some of the plants of which, it is afferted, may ftand at two feet, others not above two inches feparate from each other; but that wherever two are clofe together, by being unencumbered all round, they grow more vigoroufly than the others; and as the bulk fwells, pufh each other afunder; fo that in a fhort time the whole furface of the field is covered. The fame thing, it is contended, takes place in natural woods. Suppofe two fpaces, containing twenty fquare yards each, and in each fpace two trees; but in one the trees to be planted three feet afunder, and the other three yards: when ten years growth has taken place, the bulk and height produced upon each of the fpaces would be exactly alike in every refpect.

In regard to the methods of introducing or inferting the plants, in making plantations with them, they are in fome meafure different. The modes either by pitting them in or flit-planting are probably the beft, as being the moft generally practifed; they may, however, be put in by the dibble, though it is a practice which can feldom be had recourfe to with propriety or much fuccefs. With the pine and fir tribe of plants, the mode of planting is moftly confidered as more cheap and expeditious, than that of fowing the feeds; but in raifing large and extenfive woods and forefts, or other forts of plantations, where moft kinds of deciduous trees are required, and efpecially the oak and the afh, which fhould be the moft generally grown, they ought to be produced from the feeds by fowing them in the fituations where the plants are finally to remain and become trees. The feed of the oak put into the earth at the fame time with a plant of the fame kind five or fix years old, will, it is fuppofed, over-top it in the courfe of feven years, and frequently fooner; befides, they are believed by fome to laft much longer, and ultimately to produce much better and more valuable timber. In all places where the ground is fully and properly prepared, and in which it is defirable to raife oak plants, for becoming trees, it will be found the beft method to fow the feeds, as this can be done at lefs than a fifth of the expence of planting out the young plants, and befides, the trees will turn to advantage, either as timber or undergrowth much more expeditioufly. And farther, as the oak is a particularly valuable fort of tree for its bark equally as well as for the timber, it ought to be univerfally raifed; and were the above mode more generally attended to, there would be found a faving, even in the firft place, of from three to four pounds the acre, which, to thofe who plant largely, would be of great confequence.

Plants, in *Gardening*, young living vegetables of any kind, which are raifed or produced from a feed or in any other manner. Plants are of many different forts and defcriptions, as well as employed for a variety of different ufes, and in a great diverfity of intentions. They may, however, in the view of their garden culture, be principally confidered as of the herbaceous, fhrubby, and tree kinds, and as being annual, biennial, and perennial in their nature, and the time of their continuance.

Every plant may be faid to confift of a root, that ftrikes down into the ground, or into fome other body in fome way or other, and which fends off numerous ramifications, which ferve the purpofe of fixing it in the earth or other fituation, and at the fame time to fupply it with food or nourifhment for its growth, increafe, and continuance. There is likewife a ftalk, ftem, or trunk, which rifes upwards into the atmofphere, and which is compofed of a bark in the outer parts, a fubftance which is called *alburnum*, more internally a woody material, and a medullary matter, that is termed *pith*, in the infide of the whole. From this ftem or trunk are formed and fent off the different branches and twigs, which contain the leaves and flowers, and which are very different in different forts of plants. Befides which, all plants are furnifhed and provided with different forts of veffels for conveying their fap, juices, and other kinds of fluids, and endued with feveral different powers, motions, and properties, which ferve their different habits of growth, and the ufes and intentions which they are to fulfil. See Vegetable, and Vegetation.

The mode of growth and increafe in plants, after they have been evolved and fprung up from feeds, or in any other

other manner, is deſcribed ſomewhat in this way by a late writer upon the ſtructure and economy of plants; the root part of a plant at firſt advances more rapidly than the ſtem; as it has been found that an oak plant a foot and a half high has a root four feet in length, and that, if the principal root be in any way mutilated, the plant emits radicles in every direction; which always grow faſter than if the root had remained perfect. Such radicles at firſt do not receive any conſiderable increaſe; but ſoon afterwards augment into a body almoſt equal to the principal root, and then protrude new radical ſhoots in a lateral direction. Alſo, that the roots are prolonged at the extreme apex or point, as will be perfectly evident, if any root be coloured with varniſh or any other ſubſtance of a ſimilar kind in different places; and it is, likewiſe, well known, that the radicles always ſhoot out in that part where the earth is the moſt humid, ſo that walls are not unfrequently thrown down or overturned by their power of penetrating towards moiſt places, or ſituations where the ſoil is the moſt ſoft in its nature.

But the trunk of a plant is expanded throughout its whole length, and not at the apex only, as in the caſe of the root; for if the tender ſtem of a plant, at the beginning of ſpring, be coloured over with varniſh, or any other matter of the ſame kind, and marked in different places, the marks will, after a few months, be found to have receded in the ſeveral different parts when formed.

It is found that, in the growth, in an *annual* plant, the expanſion of the ſtem in length continues until the explication of the flowers has fully taken place; at which time the fibres that conſtitute the ſtalk, begin to grow hard, and to be indurated, and ultimately in a gradual manner to become dry and firm.

But in a *perennial* plant the increaſe of the ſtem continues until the leaves fall, or are deſtroyed in the autumnal ſeaſon; during which time a germ or bud ariſes in the apex, in which the rudiment of the new ſtem, during winter, increaſes ſlowly until the following ſpring; when caſting off its winter involucra, it continues the increaſe of the ſtem in the ſame way as the inferior part increaſed during the former year: for in that place where a bud is ſeated, a tumour extends, which is ſo continued with the new ſtem as ſcarcely to leave any veſtige behind it.

It is remarked, that the increaſe of the ſtem in breadth does not ariſe from the dilatation of the ligneous or woody layers, but from the generation of new layers, which are annually depoſited by the veſſels of the bark. This is ſaid to be fully explained and illuſtrated by the following experiments. "If the ring of the bark be torn from the trunk of a tree, and the ligneous cylinder of the naked part be perfectly ſurrounded with a leaf of tin, and the whole (after having replaced the cut-out ring of the bark) be covered with the tree plaſter; then, upon cutting the tree ſome years after, it will appear that the ligneous cylinder, covered with tin, has received no increaſe, and that the tin, inſerted between the ligneous cylinder and the new ligneous ſtrata, is complete. Theſe ligneous ſtrata appear to be generated from the cortex; for if metallic threads be inſerted obliquely into the cortex, they are after ſome years found in the wood itſelf, and not in the cortex or bark of the tree or plant."

It is ſhewn by attentive obſervation, that the trunk of a tree receives two ligneous or woody layers in the courſe of the year; but that the thickneſs of theſe layers is not the ſame every year; for it is the greateſt when the tree is of a middle age, and the warmer the ſummer the more ſlender is the bark.

It would ſeem, that the bark is protruded by the vital or living power of the veſſels, which are placed in the wood of the tree or plant.

And the generation of the branches is ſuppoſed to be from the corona, or plexus of veſſels, which is ſituated between the wood and medulla, or pith, from whence they proceed. Each germ or bud produces a new branch, ſo that it may be ſaid to give birth to a new plant, which was ſhut up and laid concealed in that particular bud; for the branch contains every part which is eſſentially neceſſary to form a new plant, as is evident from cutting off a branch, and planting it in the ground, by which means a perfect tree or plant is produced, and ſoon grows up. The veſſels, it is believed, principally protrude where there is the leaſt reſiſtance in the bark, as in the axilla of the leaves, the nodes, and the joints; the ſame is noticed in reſpect to the branches of the root, and explains the reaſon, why the propagation of plants does not ſucceed by the ſlip or branch, unleſs a node, joint, or germ remain in them. Alſo why, if a branch of a tree or plant, that is yet adhering to it, be plaſtered or covered round with earth or moiſt dung, there proceeds from it a root into theſe ſubſtances. And why the ancients falſely attributed the generation or production of boughs to the medulla or pith of the tree; as in trees which are deſtitute of this ſubſtance, it is ſeen that no branches are produced or brought forth.

Further, the generation or production of leaves in plants originates from the veſſels of the bark only; for, the bark being ſeparated from the wood, no connection of the leaves with the wood can be obſerved; and the bark alone, if put into water, produces leaves.

Laſtly, in the generation or production of the flowers of plants, the exterior bark, or epidermis, would ſeem to proceed into the cups, the alburnum into the corolla, and the ſeries of veſſels into the other parts of them.

Plants are likewiſe found to be of very different kinds and qualities, in reſpect to their powers of bearing fruit, or of becoming prolific, as well as that of their differing in ſo many other particulars, as in their natures, modes of growth, and various other points of conſequence.

Many of them have the male and female parts in the ſame individual flower, whence they are commonly denominated hermaphrodite plants; and there are others, which have the male and female flowers in a ſtate of intermixture on the ſame ſtem or branch, as is the caſe with the cucumber and melon, as well as ſome other kinds of plants. Some have alſo the flowers all over them without any fruit being produced, while others of the ſame kind, at the ſame time, have flowers, and produce fruit, which afford the diſtinction of male and female plants. But as thoſe of the female ſort only produce fruit, thoſe of the firſt mentioned kind are conſtantly conſidered to be of this nature.

A perfect knowledge of theſe circumſtances is of great advantage in the buſineſs of practical gardening, as it can be applied to many uſeful purpoſes in providing fruit, as well as good ſeeds of different kinds.

Much of the labour and attention of the horticulturiſt is likewiſe employed in the raiſing and providing plants of the herbaceous kind, which are extremely numerous, and not a few of them of conſiderable importance, in the view of food, requiring to be cultivated and produced in a regular and conſtant manner. They differ greatly, however, in their natures and qualities, as well as in their management and means of production. There are ſome, which have but little ſtem, being chiefly of a leafy deſcription; others, in which the ſame part is far more conſiderable, but of a fleſhy, tender nature; and ſtill others in which the ſtalks are tough, hard, and of rather a ligneous quality.

Whenever herbaceous plants of any of these kinds are to be raifed, it is almoft conftantly done from the young plants, after they have had fome little growth from the feeds, and are in a perfect condition in every refpect. This method is purfued in all the different kinds of cabbages, cauliflowers, brocolies, and lettuces, as well as with endive, celery, and many others. But there are fome which are raifed from feeds without being tranfplanted in the above manner, and a few from offsets or flips, and by dividing the roots or other parts.

In the fhrubby and tree kinds, the plants are moftly increafed from feeds, cuttings, layers, and flips.

All plants poffefs, by means of their living principles, the proper and neceffary degrees of heat, by which they vegetate, increafe, and are enabled to refift the over-abundant cold or heat, which may at any time furround them; but they differ very materially in this refpect, fome having a much greater power of doing it than others. There are fome which have alfo a remarkable capability of refifting cold in their roots; and others, which are equally remarkable in refifting heat. The kidney bean is an example of the former kind, and that of the cucumber of the latter: for if a green leaf of the former vegetable be introduced into the frozen juice of fpinach, it quickly becomes thawed; and if a veffel full of water be expofed in a bed of cucumbers, the water fpeedily becomes warm, but the cucumbers remain cold to the touch; and if one be eaten the ftomach is found to be cooled, as if it had taken ice. And the fame thing has been found in refpect to fruits, while growing upon the trees. The ftate of heat in plants would therefore feem to proceed from the matter of heat, which is taken from the furrounding air; and hence it is, that the fhades of all forts of trees are fo cooling in their nature.

Plants, *Foffile*. Many fpecies of tender and herbaceous plants are found at this day, in great abundance, buried at confiderable depths in the earth, and converted, as it were, into the nature of the matter they lie among; foffile wood is often found very little altered, and often impregnated with fubftances of almoft all the different foffile kinds, and lodged in all the feveral ftrata, fometimes firmly imbedded in hard matter, fometimes loofe: but this is by no means the cafe with the tenderer and more delicate fubjects of the vegetable world. Thefe are ufually immerfed either in a blackifh flaty fubftance, found lying over the ftrata of coal, or elfe in loofe nodules of ferruginous matter of a pebble-like form, and they are always altered into the nature of the fubftance they lie among: what we meet with of thefe are principally of the fern kind: and what is very fingular, though a very certain truth, is, that thefe are principally the ferns of American growth, not thofe of our own climate. The moft frequent foffile plants are the polypody, fpleenwort, ofmund, trichomanes, and the feveral larger and fmaller ferns; but befide thefe there are alfo found pieces of the equifetums, or horfe-tails, and joints of the ftellated plants, as the clivers, madder, and the like; and thefe have been too often miftaken for flowers; fometimes there are alfo found complete graffes, or parts of them, as alfo reeds and other watery plants; fometimes the ears of corn, and not unfrequently the twigs or bark, and impreffions of the bark, and fruit of the pine or fir kind, which have been, from their fcaly appearance, miftaken for the fkins of fifhes; and fometimes, but that very rarely, we meet with moffes and fea-plants.

Many of the ferns not unfrequently found, are of very fingular kinds, and fome fpecies yet unknown to us; and the leaves of fome appear fet at regular diftances, with round protuberances and cavities. The ftones which contain thefe plants fplit readily, and are often found to contain, on one fide, the impreffion of the plant; and on the other the prominent plant itfelf: and, befide all that have been mentioned, there have been frequently fuppofed to have been found with us ears of common wheat, and of the maize or Indian corn; the firft being in reality no other than the common endmoft branches of the firs, and the other the thicker boughs of various fpecies of that and of the pine kind, with their leaves fallen off; fuch branches in fuch a ftate cannot but afford many irregular tubercles and papillæ, and, in fome fpecies, fuch as are more regularly difpofed.

Thefe are the kinds more obvious in England; and thefe are either immerfed in the flaty ftone which conftitute whole ftrata, or in flattened nodules, ufually of about three inches broad, which readily fplit into two pieces on being ftruck.

They are moft common in Kent, on coal-pits, near Newcaftle, and the foreft of Dean, in Gloucefterfhire; but are more or lefs found about almoft all our coal-pits, and many of our iron-mines.

Though thefe feem the only fpecies of plants found with us, yet in Germany there are many others, and thofe found in different fubftances. A whitifh ftone, a little harder than chalk, frequently contains them; they are found alfo often in a grey flaty ftone, of a firmer texture, not unfrequently in a blackifh one, and at times in many others; nor are the bodies themfelves lefs various here than the matter in which they are contained; the leaves of trees are found in great abundance, among which thofe of the willow, poplar, whitethorn, and pear-trees, are the moft common; fmall branches of box, leaves of the olive-tree, and ftalks of garden thyme, are alfo found there; and fometimes ears of the various fpecies of corn, and the larger as well as the fmaller moffes in great abundance.

Thefe feem the tender vegetables, or herbaceous plants, certainly found thus immerfed in hard ftone, and buried at great depths in the earth: others of many kinds there are alfo named by authors; but as in bodies fo imperfect, errors are eafily fallen into, thefe feem all that can be afcertained beyond mere conjecture. Hill's Hift. of Foffils. See Petrifaction.

Plants, *Marine*. See Sea-*Plants*.

PLANUM, Os, in *Anatomy*, the fmooth orbital plate of the ethmoid bone. See Cranium.

PLAPPERT, in *Commerce*, a money of account in Switzerland; 15 plapperts, or fkillings, being = 12 grofchen, or gros, = 10 Swifs batzes = 9 good batzes = 1 livre, and containing 36 creutzers = 90 rappen = 180 pfenings.

PLAQUET, in *Ancient Armour*, a plate which was occafionally added to the breaft-plate, in order to ftrengthen it.

PLAS, in *Biography*, two brothers, born in Spain, celebrated performers on the hautbois, who, like the two Bezozzis of Turin, always lived, practifed, and performed together, as one and the fame being. They left Madrid in 1752, and arrived at Paris the fame year, where their performance excited equal wonder and extacy. Their tone, expreffion, tafte, and execution, were as exactly fimilar as double ftops on the fame inftrument.

In 1761 they went into Germany, and were engaged in the chapel of the duke of Wirtemberg, and in his houfhold as chamber muficians.

PLASCHKEN, in *Geography*, a town of Pruffian Lithuania; 9 miles N.W. of Tilfit.

PLASEMBURG, a town of Tranfylvania, near Hermanftadt.

PLASENCIA, or Placencia, a town of Spain, in the province of Guipufcoa; 20 miles N. of Vittoria.

Plasencia,

Plasencia, a town of Spain, in the province of Eſtramadura, ſituated in the middle of mountains, in a narrow valley, tolerably fertile, nine leagues long, and watered by the river Xerte. The town ſtands on the banks of this river, and is partly ſurrounded by it, as if in a peninſula. Its ſituation is alſo embelliſhed by an agreeable promenade. Plaſencia is a ſuffragan of San Jago, and its dioceſe comprehends a cathedral, chapter, and 152 pariſhes. This town is the chief place of a corregidoret, and contains ſeven pariſh churches, three convents of monks, and ſeveral chapels or oratories. Here is a fine aqueduct, which conveys water from the diſtance of two leagues, and has upwards of 80 arches; 95 miles W.S.W. of Madrid. N. lat. 40° 3′. W. long. 5° 9′.

PLASH, in *Rural Economy*, the bough or ſtem which is laid down by means of a nick or cut being made on the upper ſide of it, in repairing or reſtoring old hedge-fences.

PLASHER, a perſon of the labouring kind, whoſe buſineſs is the making or repairing of hedge-fences by means of plaſhing.

PLASHING of hedges, the operation or proceſs by which this ſort of work is performed in reſtoring old run up open hedges. The uſual mode of executing it is as follows; the ſtronger ſtems are ſelected, at as regular diſtances as poſſible, and generally at about thirty inches apart. Theſe are called the ſtakes; and are commonly headed over at four or five feet above the ſurface, according to the general ſtrength of the hedge in queſtion, ſo as they may all range in line, and at one height. The more pliable branches and ſmall twigs are interwoven, in the baſket manner, among the ſtakes, from top to bottom, as cloſely as poſſible. Such as will not bend in a pliable manner, and afterwards remain in due poſition, are ſnagged half through with the bill, to make them more obedient. The ſtrong ſtems that cannot be laid in, and are not wanted for ſtakes, are cut cloſe by the ſurface. In places where ſtems ſtrong enough, and fit for ſtakes, are wanting, the deficiency is ſupplied by dead ſtakes. After the plaſhing is finiſhed, the hedge is dreſſed ſmooth on both ſides with the bill, or ſome other ſimilar inſtrument. This is a method that is much practiſed in Hertfordſhire and ſome other counties. See Fence.

The principal objection to this mode, which is certainly the cheapeſt and moſt eaſily performed, is, that the ſtakes, or cut-over ſtems, ſhoot forth ſtrongly to the detriment of the under part of the hedge, which, by over-ſhadowing, they retard in growth, and keep naked of ſpray; and which probably ſuggeſted an improvement, which is that of cutting none over at all, but weaving in the tops of the ſtakes along with the plaſhes. The propriety of this mode is at once evident; for, beſides that the above complaint cannot poſſibly attach, the ſtems cut by the ſurface ſend up a ſtrong growth, which, intermixing with the plaſhes, renders the whole more cloſe and impenetrable than would otherwiſe be the caſe.

In caſes where two rows of quicks have been planted, according to the common method, at the diſtance of a foot from each other, the *back* row being plaſhed in ſome of the above modes, and the front one being cut down to the ſtub, would be the moſt effectual method of preſerving the preſent, and producing a new fence. It is, however, conceived, that this operation can only be effectually and *handſomely* performed in caſes where there is a good portion of ſpray and long pliable ſhoots or branches; and when the edge has, if not youth, at leaſt vigour on its ſide, to ſend forth a luxuriant growth, and cover the naked appearance the plaſhes would otherwiſe have. And that for the more handſome performance of this buſineſs, there is alſo a ſeaſon more ſuitable than another, which is the fall, or beginning of winter, as at this ſeaſon the ſhoots are more pliable than in ſpring, when the ſap begins to riſe and circulate; at which time the ſhoots of all plants are moſt brittle. After the hedge is plaſhed, the ditch, provided there be one, ſhould be ſcoured out, and dreſſed up; and that where the fence is properly attended to, in regard to pruning and cutting, it may laſt for many years.

The manner of executing this ſort of work in the Hertfordſhire mode has been fully explained in ſpeaking of the nature of reſtoring fences.

This ſort of practice is ſometimes neceſſary to be had recourſe to in gardens where the outward fences have been ſuffered to run up in rude growth, naked and open at the bottoms; they being reformed and reduced to order by proper trimming, thinning, cutting, and laying down the general ſtems and branches in a ſlanting manner lengthways, according to the ranges of the hedges, being interwoven between other ſtems which are left upright; the work being aſſiſted by ſuitably nicking, cutting, or gaſhing the different parts on their upper ſides; and the whole of the ſmaller lateral branches being plaſhed in, ſo as to cloſe all the lower vacancies, and thicken every part regularly from the bottom to the top, to the height of from three to four feet, or a little more, according to circumſtances.

This proceſs is occaſionally performed to any kind of deciduous common hedges, ſuch as thoſe of white-thorn, black-thorn, elm, poplar, beech, or other ſorts; and in proceeding in the work, it is frequently neceſſary, eſpecially in very diſorderly rough edges, previouſly to trim or lop off much of the outward and over-growing rude branches of them, as well as the large naked wood and obviouſly ſuperabundant growths, both above and below; carefully bringing down ſuch branches or other parts as are left in an exact and regular manner, plaſh after plaſh, until the whole buſineſs is finiſhed.

PLASM, Plasma, is ſometimes uſed for a mould, wherein any metal, or ſuch like running matter, which will afterwards harden, is caſt to receive its figure.

PLASO, in *Botany*, Rheede Hort. Mal. v. 6. 29. t. 16, 17, is a very noble papilionaceous and leguminous ſhrub, or tree, referred by Lamarck to *Erythrina*, with the ſpecific name of *monoſperma*. Juſſieu, Gen. 357, mentions it under that genus, with a hint, extremely well founded, of its probably conſtituting a new one. Of this the celebrated Daniſh botaniſt, Koenig, who gathered in India two ſpecies of the genus in queſtion, was aware. He named it *Butea*, after that diſtinguiſhed lover of botany, the firſt earl of Bute; either not knowing, or not recollecting, that another genus was called *Stuartia* by Linnæus, in honour of this nobleman, and was univerſally received under that denomination. Dr. Roxburgh has however publiſhed the *Butea*, and it is adopted by Willdenow, Sp. Pl. v. 3. 917, as well as in Ait. Hort. Kew. v. 4. 252, and by the late Rev. Mr. Wood, in our 5th vol. See Butea.

The name is altogether inadmiſſible on the ground above mentioned, one genus being abundantly ſufficient to commemorate any one perſon whatever, nor has there ever been a ſimilar example, among claſſical writers of the Linnæan ſchool. *Butea* may neverthe leſs remain as a memorial of the late marchioneſs of Bute, who paid much attention to botany, and is mentioned as having introduced ſeveral plants from the gardens of Madrid, into thoſe of England.

PLASS, in *Geography*, a town of Bohemia, in the circle of Rakonitz; 18 miles S.W. of Rakonitz.

PLASSEY, a town of Hindooſtan, in Bengal, near which

which colonel Clive defeated the troops of Surajah Dowlah in 1757; 25 miles S. of Moorshedabad.

PLASTER, or PLAISTER, in *Building*, a composition of lime, sometimes with hair, sometimes with sand, &c. to parget or cover the nudities of a building.

There is also a plaster of a coarser sort than the plaster of Paris, which is sometimes used in this country for floors in gentlemen's houses, and for corn-granaries: it is made of a blueish stone, taken out of quarries, which are generally at the side of a hill, much like the stone of which Dutch terras is made: the stone is burnt like lime, becomes white by burning, and when mixed with water, does not ferment like lime: when cold, it is beat into a fine powder; and when it is used, the quantity of about a bushel is put into a tub, and water applied to it, till it becomes liquid: in this state it is well stirred with a stick, and used immediately; for in less than a quarter of an hour it becomes hard and good for nothing, as it will not bear being mixed a second time like lime. See GYPSUM, and PLASTERING.

PLASTER, in *Pharmacy*, an external application of a harder consistence than our ointments: these are to be spread according to the different circumstances of the wound, place, or patient, either upon linen or leather.

If the part upon which they are to be laid be naturally hairy, it must be shaved; but that they may stick the better, the natural shape of the part must be consulted, and the plaster spread and formed accordingly, either round, square, triangular, elliptical, in a lunar form, or in shape of the letter T. Some also are divided at both ends, and others are perforated in the middle: these last are of frequent use in fractures attended with a wound; for by this contrivance the wound may be cleansed and dressed without removing the plaster.

Indeed there is almost no part of the body which a plaster of one of those forms may not be made to serve for, if it be notched about the edges with a pair of scissars. See EMPLASTRUM.

The use of plasters is various; they are serviceable in securing the dressings, they also forward the maturation of the pus, agglutinate and heal wounds, unite broken bones, heal burns, assuage pain, and strengthen weak parts. In many instances they contain acrid and stimulating substances, and operate as rubefacients, or blisters.

The calces or oxyds of lead boiled with oils, unite with them into a plaster of a proper consistence, which makes the basis of several other plasters: but some of them owe their consistence to wax and resin; and others contain no oily or fatty matter whatever: in boiling these compositions, a quantity of hot water must be added from time to time, to prevent the plaster from burning and growing black; but this should be done with care, lest it cause the matter to explode.

Plasters should not adhere to the hand when cold; they should be easily spread when heated; and after they are spread they should remain tenacious and pliant; but they should not be so soft as to run when heated by the skin. All plasters become too consistent or brittle when long kept; but in this case, those which are unctuous may be remelted by a gentle heat, and some oil added to them. They are usually formed into rolls, each of which is wrapped in paper, and when used, they are melted, and spread on leather, calico, linen, or silk. Those that contain metallic oxyds ought to be melted by boiling water, for in a greater degree of heat the fatty matter is apt to reduce the oxyd.

PLASTER, *Adhesive*. See EMPLASTRUM.

PLASTER, *Ammoniac*, is formed by dissolving 5 oz. of purified ammoniac in half a pint of acetic acid (distilled vinegar), and evaporating the solution in an iron vessel placed in a water bath; constantly stirring it till it acquire a proper consistence. This plaster, which is stimulant and resolvent, is applied to scrophulous humours, and white swellings, and sometimes over the scalp, in tinea capitis.

PLASTER, *Ammoniac, with Mercury*. See EMPLASTRUM.

PLASTER, *Anodyne*. See EMPLASTRUM, and PLASTER *of Opium*, infra.

PLASTER, *Aromatic*, is formed, according to the directions of the Dublin pharmacopeia, of frankincense, 3 oz.; yellow wax, $\frac{1}{2}$ oz.; cinnamon bark in powder, 6 dr.; oil of pimenta and oil of lemons, of each 2 dr. Melt the frankincense and the wax together, and strain the mixture; when it thickens by cooling, mix with it the powder of cinnamon previously rubbed with the oils, and form them into a plaster. This plaster is an elegant stimulant, and applied to the region of the stomach in dyspepsia, and increased irritability of that viscus, allays pain and vomiting, and expels flatus. As the oils are very volatile, it must be spread by the thumb without being melted. It requires to be frequently renewed, and is not very adhesive.

PLASTER, *Assafœtida*, consists, by the Edinb. pharm., of plaster of semi-vitreous oxyd of lead, and assafœtida, of each two parts, and galbanum and yellow wax, of each one part. This plaster is sometimes applied over the umbilical region, in flatulence and hysteria.

PLASTER, *Blistering*, *Emplastrum Lyttæ* of the Lond. pharmac., is made by melting $1\frac{1}{2}$ lb. of wax plaster with a pound of prepared lard, and after removing them from the fire, when the mixture is beginning to be solid, sprinkling in 1 lb. of blistering flies reduced to a very fine powder, and mixing the whole together. The *emplastrum Meloes vesicatorii*, olim, *emplastrum vesicatorium* of the Edinb. pharm., consists of mutton suet, yellow wax, resin, and blistering flies, of each equal weights. Reduce the insects to a fine powder, and mix them with the other articles, previously melted together, and removed from the fire. The *emplastrum cantharidis* of the Dubl. pharmac. is formed by melting purified yellow wax and mutton suet, of each a pound, and 4 oz. of yellow resin together, and a little before they concrete in becoming solid, sprinkling in 1 lb. of blistering flies in fine powder, and forming the whole into a plaster. (See EMPLASTRUM.) Blistering plasters should remain applied at least for twelve hours to raise a perfect blister; they are then to be removed, the vesicle is to be cut at the most depending part, and without removing the cuticle, the vesicated part is to be dressed with simple cerate, or spermaceti ointment; and the old cuticle allowed to remain until a new one is formed under it; when it peels off, and the whole is healed in the course of a few days. The application of these plasters is sometimes attended with strangury and bloody urine, from the absorption of the active principles of the insect, and the irritation of the kidnies and urethra; and this effect is much increased, if the blister be applied over an abraded surface, *e. g.* on the head after it has been immediately shaved, and also if the plaster has remained too long applied. To prevent strangury, it has been recommended to mix camphor with the blistering composition, but this has no good effect; it is better obviated by copious dilution with milk, or mucilaginous fluids, and fomentations of warm milk and water to the blistered part, after the removal of the plaster. When the head is to be blistered, it should be shaved at least ten hours before the plaster is applied; and in all cases it is expedient to interpose a piece of thin gauze between the vesicatory and the skin, wetted with vinegar, and applied smooth and very close over the plaster.

plaster. When the blistered part becomes a spreading sore, which is sometimes the case in irritable habits, the best local application is a warm emollient poultice, and bathing the denuded surface frequently with tepid milk and water; while at the same time cinchona bark is internally administered. See Blister.

Plaster *of Spanish flies, compound,* of Edinb. pharm., is prepared of 18 parts of Venice turpentine; Burgundy pitch and blistering flies, of each 12 parts; yellow wax, 4 parts; subacetite of copper, 2 parts; white mustard seeds and black pepper, of each 1 part. Melt the Burgundy pitch and the wax, and add to them the turpentine; while these remain still warm, after being melted, sprinkle in the other ingredients reduced to fine powder, and mix them, stirring constantly, so as to form a plaster. This plaster is intended to raise a blister more quickly than the former, and is therefore adapted to cases of gout and cramps of the stomach, in which the effect of the blister must be almost instantly produced. Its operation is attended with much pain and pungent sense of heat; and it is apt to produce very unpleasant ulceration if allowed to remain too long applied.

Plaster, *Cephalic.* See Emplastrum *Cephalicum.*

Plaster, *Common.* See Emplastrum *Commune.*

Plaster, *Cumin.* See Emplastrum *è Cymino.* This plaster is stimulant and discutient; and is applied to the hypogastric region in flatulence and a cold feeling of the bowels, and to indolent tumours.

Plaster, *Drawing.* See Emplastrum *Attrahens.*

Plaster *of Galbanum, Compound,* of the Lond. pharm., is composed of purified galbanum, 8 ounces; plaster of lead, 3 pounds; common turpentine, 10 drachms; and resin of the spruce fir powdered, 3 ounces. Having melted the galbanum and the turpentine together, mix in first the resin, and then the plaster of lead previously melted by a slow fire, and mix the whole together. The *plaster of galbanum* of the Dub. pharm. is prepared by adding to $\frac{1}{2}$ lb. of galbanum melted by heat, 2 lbs. of litharge plaster, and 4 oz. of yellow wax sliced; and then melting the whole together by a gentle heat.

Plaster, *Gum,* of Edinb. ph., is composed of 8 parts of plaster of semi-vitreous oxyd of lead, and ammoniac gum-resin, galbanum, yellow wax, of each 1 part. See Emplastrum *Gummi.*

These plasters are stimulant and suppurative. They are applied with advantage to scrophulous tumours; to joints which have been long affected with arthritic pains; and to the loins in rickets. As a suppurative, they are applied to indolent tumours, and to reduce the induration which often remains round abscesses, after they are discharged.

Plaster, *Mercurial.* (See Emplastrum *commune cum Mercurio.*) The Edinb. pharmac. directs it to be prepared of olive oil and resin, of each 1 part; mercury, 3 parts; plaster of semi-vitreous oxyd of lead, 6 parts; rub the mercury with the oil and the resin, previously melted together and cooled, until the globules disappear; then add gradually the plaster of semi-vitreous oxyd of lead melted, and let the whole be carefully mixed together. These plasters are powerful discutients, and are applied to buboes, venereal tumours, nodes when they are not very painful to the touch, and indurations; they are also applied to joints affected with obstinate syphilitic pains.

Plaster *of Opium,* consists of hard opium powdered, $\frac{1}{2}$ oz.; resin of the spruce fir powdered, 3 oz.; lead plaster, 1 lb.: melt the plaster and the resin together, then add the opium, and mix the whole. This plaster is said to be anodyne, and useful in relieving rheumatism and local pains.

Plaster *of red oxyd of Iron* of Edin. pharm., formerly *strengthening plaster,* is composed of plaster of semi-vitreous oxyd of lead, 24 parts; resin, 6 parts; yellow wax and olive oil, of each 3 parts; and red oxyd of iron, 8 parts; rub the red oxyd of iron with the oil, and add the other ingredients melted.

Plaster *of Frankincense* of Dubl. pharm. is formed of litharge plaster, 2 lbs.; frankincense, $\frac{1}{2}$ lb.; and red oxyd of iron, 3 oz.; to the frankincense and plaster melted together add the oxyd, stirring them together so as to form a plaster. These plasters are supposed to be tonic; and are used in muscular relaxations, and weaknesses of the joints after sprains; but they act chiefly in affording a mechanical support to the parts. See Emplastrum *Roborans.*

Plaster, *Compound pitch,* is composed of dried pitch, 2 lbs.; frankincense, 1 lb.; yellow resin and yellow wax, of each 4 oz.; and expressed oil of nutmeg, 1 oz. To the pitch, resin, and wax, melted together, add first the frankincense, then the oil of nutmeg, and mix the whole. This plaster is stimulant and rubefacient. It is used in catarrh, and other pulmonary affections, applied to the thorax; and in head-ache, and chronic ophthalmia, applied to the temples. When a serous exudation takes place, the plaster should be frequently renewed.

Plaster, *Head,* is prepared by boiling together over a slow fire, of semi-vitreous oxyd of lead, rubbed to a very fine powder, 5 lbs.; olive oil, a gallon; water, 2 pints, stirring constantly until the oil and oxyd of lead cohere into the consistence of a plaster. It is necessary, however, to add a little boiling water, if the whole of that which was employed at first shall be consumed before the end of the process.

Plaster *of semi-vitreous oxyd of Lead,* formerly *common plaster,* is prepared of the semi-vitreous oxyd of lead, 1 part; and olive oil, 2 parts; having added some water, boil them, stirring constantly, until the oil and the oxyd unite into a plaster. See Emplastrum.

Plaster, *Litharge,* of Dub. ph., is prepared by mixing 5 lbs. of litharge in fine powder; 9 lbs. of olive oil, and 2 pints of boiling water, at a high temperature, constantly stirring until the oil and the litharge unite so as to form a plaster, supplying occasionally any waste of water that may take place. These plasters are intended chiefly to defend excoriated surfaces from the action of the air, and to form the basis of some other plasters.

Plaster, *Resin,* is formed of yellow resin, $\frac{1}{2}$ lb., and lead plaster, 3 lbs.; melt the lead plaster by a gentle heat; then add the resin in powder and mix.

Plaster, *Resinous,* formerly *adhesive plaster,* is composed of plaster of semi-vitreous oxyd of lead, 5 parts, and resin, 1 part.

Plaster *with Resin, Litharge,* is formed by melting $3\frac{1}{2}$ lbs. of litharge plaster by a moderate heat, and adding $\frac{1}{2}$ lb. of yellow resin finely pulverized, that it may melt quickly, and form a plaster. (See Emplastrum *Adhesivum.*) These plasters are defensive, adhesive, and gently stimulant; they are used for retaining together the lips of recent wounds, when it is proposed to heal them by the first intention; to give support to ulcerated parts; and to assist their granulation and cicatrization.

Plaster, *Soap.* (See Emplastrum *Saponis.*) The *soap plaster* of the Edinb. pharm. is composed of 4 parts of semi-vitreous oxyd of lead; 2 parts of gum plaster, and 1 part of soap sliced. Mix the soap with the plasters melted together; then boil them a little so as to form plaster. Soap plaster is discutient, and is applied to lymphatic tumours; but it is much less useful than the mercurial plaster.

Plaster, *Stomachic.* See Emplastrum *Stomachicum.*

Plaster, *Warm*, is made by melting together, over a gentle fire, one ounce of gum plaſter, and two drachms of bliſtering plaſter; or one part of plaſter of cantharides, and ſeven parts of Burgundy pitch, according to the Dublin pharmacopeia. This is uſeful in catarrh, hooping-cough, the ſciatica, and other fixed pains of the rheumatic kind. It ought, however, to be worn for ſome time, and to be renewed, at leaſt, once a week.

Plaster, *Wax*, is formed by melting together of yellow wax and of prepared ſuet, of each three pounds; and yellow reſin a pound; and then ſtraining. The *ſimple plaſter*, formerly *wax plaſter* of Edinburgh pharmacopeia, is formed of yellow wax, three parts; mutton ſuet and reſin, of each two parts. Theſe were generally uſed inſtead of the melilot plaſter, as a proper application after bliſters, and in other caſes where a gentle digeſtion is neceſſary; but on account of the pain and irritation they occaſion, they are now ſeldom employed.

Plaster *of Paris*, is a foſſile ſtone, ſerving many purpoſes in building; and uſed likewiſe in ſculpture, to mould and make ſtatues, baſſo relievos, and other decorations in architecture.

It is dug out of quarries, in ſeveral parts of the neighbourhood of Paris; whence its name. The fineſt is that of Montmartre. See Gypsum.

Plaſter of Paris, among our workmen, is of two kinds, *viz. crude*, or in the ſtone, and *burnt*, or beaten.

The *crude* is the native plaſter, as it comes out of the quarry; in which ſtate it is uſed as ſhards in the foundations of buildings.

The *burnt* plaſter is a preparation of the former, by calcining it like lime in a kiln or furnace, and then beating it into powder, and diluting and working it. In this ſtate it is uſed as mortar, or cement, in building.

This, when well ſifted, and reduced into an impalpable powder, is uſed alſo to make figures, and other works of ſculpture; and is, beſides, of ſome uſe in taking out ſpots of greaſe, &c. in ſtuffs and ſilks.

The method of repreſenting a face truly in plaſter of Paris is this: the perſon, whoſe figure is deſigned, is laid on his back, with any convenient thing to keep off the hair. Into each noſtril is conveyed a conical piece of ſtiff paper, open at both ends, to allow of reſpiration. Theſe tubes, being anointed with oil, are ſupported by the hand of an aſſiſtant; then the face is lightly oiled over, and the eyes being kept ſhut, alabaſter freſh calcined, and tempered to a thinniſh conſiſtence with water, is by ſpoonfuls nimbly thrown all over the face, till it lies near the thickneſs of an inch. This matter grows ſenſibly hot, and in about a quarter of an hour hardens into a kind of ſtony concretion; which being gently taken off, repreſents, on its concave ſurface, the minuteſt part of the original face. In this a head of good clay may be moulded, and therein the eyes are to be opened, and other neceſſary amendments made. This ſecond face being anointed with oil, a ſecond mould of calcined alabaſter is made, conſiſting of two parts joined lengthways along the ridge of the noſe; and herein may be caſt, with the ſame matter, a face extremely like the original.

If finely powdered alabaſter, or plaſter of Paris, be put into a baſon over a fire, it will, when hot, aſſume the appearance of a fluid, by rolling in waves, yielding to the touch, ſteaming, &c., all which properties it again loſes on the departure of the heat; and being thrown upon paper, will not at all wet it, but immediately diſcover itſelf to be as motionleſs as before it was ſet over the fire; whereby it appears, that a heap of ſuch little bodies as are neither ſpherical, nor otherwiſe regularly ſhaped, nor ſmall enough to be below the diſcernment of the eye, may, without fuſion, be made fluid, barely by a ſufficiently ſtrong and various agitation of the particles which compoſe it; and, moreover, loſe its fluidity immediately upon the ceſſation thereof.

Two or three ſpoonfuls of burnt alabaſter, mixed up thin with water, in a ſhort time coagulate, at the bottom of a veſſel full of water, into a hard lump, notwithſtanding the water that ſurrounded it. Artificers obſerve, that the coagulating property of burnt alabaſter will be very much impaired or loſt, if the powder be kept too long, eſpecially if in the open air, before it is made uſe of; and when it hath been once tempered with water, and ſuffered to grow hard, they cannot, by any burning or powdering of it again, make it ſerviceable for their purpoſe as before. Boyle's Works Abr. vol. i. p. 133. 313. 341.

This matter, when wrought into veſſels, &c. is ſtill of ſo looſe and ſpongy a texture, that the air has eaſy paſſage through it. Mr. Boyle gives an account, among his experiments with the air-pump, of his preparing a tube of this plaſter, cloſed at one end and open at the other, and on applying the open end to the cement, as is uſually done with the receivers, it was found utterly impoſſible to exhauſt all the air out of it; for freſh air from without preſſed in as faſt as the other, or internal air, was exhauſted, though the ſides of the tube were of a conſiderable thickneſs. A tube of iron was then put on the engine; ſo that being filled with water, the tube of plaſter of Paris was covered with it; and on uſing the pump, it was immediately ſeen, that the water paſſed through into it as eaſily as the air had done, when that was the ambient fluid. After this, trying it with Venice turpentine inſtead of water, the thing ſucceeded very well; and the tube might be perfectly exhauſted, and would remain in that ſtate ſeveral hours. After this, on pouring ſome hot oil upon the turpentine, the caſe was much altered; for the turpentine melting with this, that became a thinner fluid, and in this ſtate capable of paſſing like water into the pores of the plaſter. On taking away the tube after this, it was remarkable that the turpentine, which had pervaded and filled its pores, rendered it tranſparent, in the manner that water gives tranſparency to that ſingular ſtone called *oculus mundi*. In this manner, the weight of air, under proper management, will be capable of making ſeveral ſorts of glues penetrate plaſter of Paris; and not only this but baked earth, wood, and all other bodies porous enough to admit water on this occaſion. Phil. Tranſ. N° 122.

Plaſter of Paris, diluted with water into the conſiſtence of a ſoft or thin paſte, quickly ſets or grows firm, and at the inſtant of its ſetting, has its bulk increaſed; for Mr. Boyle has found, that a glaſs veſſel, filled with the fluid mixture, and cloſely ſtopped, burſts while the mixture ſets, and ſometimes a quantity of water iſſues through the cracks.

This expanſion of the plaſter, in paſſing from a ſoft to a firm ſtate, is one of its valuable properties; rendering it an excellent matter for filling cavities in ſundry works, where other earthy mixtures would ſhrink and leave vacuities, or entirely ſeparate from the adjoining parts.

It is probable alſo, that this expanſion of the plaſter might be made to contribute not a little to the elegance of the impreſſions which it receives from medals, &c. by properly confining the ſoft matter, that its expanſion may force it into the minuteſt traces of the figure; the expanſion of the matter doing the ſame office as the preſſure by which the wax is forced into the cavities of a ſeal.

Plaſter of Paris promotes the fuſion of forged iron.

This ſubſtance is commonly uſed for taking caſts and impreſſions from figures, buſts, medals, &c. as it is adapted to the double uſe of making both caſts and moulds for forming them. See *Impreſſions of* MEDALS.

PLASTER *of Paris*, in *Agriculture*, a ſubſtance of the calcareous kind, in combination with the vitriolic acid, which has been ſometimes made uſe of as a manure. See GYPSUM and *Sulphate of* LIME.

PLASTER, in *Gunnery*, a piece of greaſed leather or rag, uſed by riflemen, &c. to make the ball fit the bore of the piece.

PLASTER *Floors*, in *Rural Economy*, ſuch floors as are conſtituted of plaſter, prepared from ſuch lime as poſſeſſes a ſtrong binding property. They are highly uſeful in cottages and farm-houſes, as affording much ſecurity againſt fire. In conſtructing them, it is obſerved, in the firſt volume of Communications to the Board, that the joiſts are laid in the uſual manner; after which a ſort of ſtrong reed, which is found in Huntingdonſhire, is nailed on, upon which the plaſter is applied; but in order to ſave it, there is frequently a thin coat of common lime laid on firſt, to fill up the crevices and inequalities. On this the plaſter is then ſpread out, to the thickneſs of about two inches, being laid on with as much expedition as poſſible. The plaſter is ſold at the kilns in the midland diſtricts, at 6*d.* the buſhel: and the expence of laying it on, if burnt and prepared, is 5*d.* the ſquare yard; but if to be burnt and prepared by the workmen, about as much more. The floors are ſaid to be excellent and cheap. Where reeds cannot be procured, laths may be made uſe of, but they come much higher. Floors of this ſort are much in uſe in Nottinghamſhire, as well as in Rutlandſhire, at the earl of Winchelſea's, where the upper floors of his farm-houſes are made of it.

Theſe kinds of floors ſhould be more attended to, in conſtructing ſmall houſes both of the cottage and other kinds, as being cheap, readily laid, and at the ſame time ſecure.

PLASTERING, in *Architecture*, is that operation which conſiſts in laying on coats of mortar, variouſly prepared, on the ceilings and walls, &c. of different buildings. This belongs to a claſs of artificers called plaſterers. See PLASTER.

Plaſterers' work is of two kinds: namely, ceiling, which is plaſtering upon laths; and rendering, which is plaſtering upon walls. Theſe are meaſured ſeparately. The contents are eſtimated either by the foot, or yard, or ſquare of 100 feet. Inriched mouldings, &c. are rated by running or lineal meaſure. Deductions are to be made for chimnies, doors, windows, &c. But the windows are ſeldom deducted, as the plaſtered returns at the top and ſides are allowed to compenſate for the window opening.

It were much to be wiſhed that this art of plaſtering could be again brought to its ancient perfection. In our beſt buildings the plaſtered walls and cielings crack and fly, and in a little time grow damp, or moulder to decay.

The Romans had an art of rendering their works of this kind much more firm and durable, and there is no reaſon to deſpair of reviving this art by proper trials.

The ancient plaſtering of theſe people preſerved to this time, where it has not met with violent blows or injuries from accidents, is ſtill found as firm and ſolid, as free from cracks or crevices, and as ſmooth and poliſhed on the ſurface, as if made of marble. The bottoms and ſides of the Roman aqueducts were made of this plaſtering, and endured many ages without hurt, unleſs by accidents: witneſs that whereof ſome yards are ſtill to be found on the top of the Pont de Gard, near Niſmes, for the ſupport of which that famous bridge was built to carry water to the ſaid town. The roofs of houſes, and the floors of rooms, at Venice are covered with a ſort of plaſter, made of later date, and yet ſtrong enough to endure the ſun and weather for ſeveral ages, without cracking or ſpoiling, and without much injury from people's feet.

The ſecret of preparing this Venetian plaſter is not among us; but it would be worth while to try whether ſuch a ſubſtance might not be made by boiling the powder of gypſum dry over the fire, for it will boil in the manner of water; and when this boiling or recalcining was over, the mixing with it reſin, or pitch, or both together, with common ſulphur, and the powder of ſea-ſhells. If theſe were all mixed together, and the water added to it hot, and the matter all kept hot upon the fire till the inſtant of its being uſed, ſo that it might be laid on hot, it is poſſible this ſecret might be hit upon.

Wax and oil of turpentine may be alſo tried as additions; theſe being the common ingredients in ſuch cements as we have accounts of as the firmeſt. Strong ale-wort is by ſome directed to be uſed, inſtead of water, to make mortar of limeſtone of a more than ordinary ſtrength. It is poſſible, that the uſe of this tenacious liquor to the powdered ingredients of this propoſed plaſter, might greatly add to their ſolidity and firmneſs. Phil. Tranſ. N° 93. See STUCCO.

PLASTIC, Πλαςικος, from πλαςις, of πλαττω, or πλασσω, *fingo*, *I faſhion*, *form*, &c. imports as much as *formative*, or a thing endued with a faculty of forming or faſhioning a maſs of matter after the likeneſs of a living being.

Some of the ancient Epicureans, and perhaps the Peripatetics too, imagine a plaſtic virtue to reſide in the earth, or at leaſt to have anciently reſided therein; and that it was by means of this, and without any extraordinary intervention of a Creator, that it firſt put forth plants, &c. Nay, ſome of them, whether ſeriouſly or not we do not undertake to determine, taught that animals, and even man, were the effects of this plaſtic power.

Some learned modern writers have ſtrenuouſly contended for the doctrine of a plaſtic nature, which they have deſcribed to be an incorporeal created ſubſtance, endued with a vegetative life, but not with ſenſation or thought, penetrating the whole created univerſe, being co-extended with it, and, under God, moving matter ſo as to produce the phenomena, which cannot be ſolved by mechanical laws; active for ends unknown to itſelf, not being conſcious of its own actions, and yet having an obſcure idea of the action to be entered upon. Dr. Cudworth reaſons thus: ſince neither all things are produced fortuitouſly, or by the unguided mechaniſm of matter, nor God himſelf may reaſonably be thought to do all things immediately and miraculouſly, it may well be concluded, that there is a plaſtic nature under him, which, as an inferior and ſubordinate inſtrument, doth drudgingly execute that part of his providence, which conſiſts in the regular motion of matter; yet ſo as that there is alſo, beſides this, a higher providence to be acknowledged, which, preſiding over it, doth often ſupply the defects of it, and ſometimes over-rule it; for as much as this plaſtic nature cannot act electively, nor with diſcretion. This doctrine, he ſays, hath had the ſuffrage of the beſt philoſophers of all ages. Ariſtotle, Plato, Empedocles, Heraclitus, Hippocrates, Zeno, and the Stoics, and the latter Platoniſts and Peripatetics, as well as the chemiſts and Paracelſians, maintained this doctrine.

" If an unintelligent agent," ſays Dr. Price, " can act with ſuch uniformity, and yet ſo variouſly, as to produce the order of the world, and govern its motions; if, for inſtance, it can

can frame the bodies of plants and animals, or ſo direct its own action as to impel the particles of matter towards one another, in ſuch different directions, and with ſuch different forces in different ſituations, as to be the conſtant cauſe of thoſe laws and powers which obtain in the corporeal univerſe, and on which depend its form and being; if, I ſay, this is poſſible, there is an end of all our reaſonings about cauſes and effects, and of all arguments for deſign and intelligence in the author of nature, taken from its regularity and beauty. It avails nothing to ſay, that this agent acts in ſubordination to the deity, and only in virtue of powers given it by him. For it is not ſuppoſed to be merely an inſtrument in the hands of the deity, which never acts except in conſequence of being firſt acted upon; but what it does, it is ſuppoſed to do properly by a power inherent in itſelf, without wanting any *immediate* direction from the deity; and the very reaſons that have been aſſigned for ſuppoſing ſuch an agent, are, that it is abſurd to think that the deity ſhould be continually employed ſo much in vain, as is neceſſary to be ſuppoſed, if the general laws of the world are derived from his agency; and that it is diſhonouring him to conceive of him as acting himſelf continually on matter, and immediately concerned in framing the bodies of the meaneſt plants and inſects. To as little purpoſe is it to ſay, that omnipotence can give ſuch a power to an unintelligent agent: for what has not wiſdom, *cannot* act wiſely; and no power can make that to be, which *cannot* be. If the deity can make a cauſe that acts without knowledge or deſign to produce regular effects; then it is in the nature of things poſſible for *ſuch* a cauſe to produce *ſuch* effects; then deſign in the cauſe is not *neceſſary* to the greateſt conceivable order and regularity in the effect, nor can we *certainly* infer the one from the other: then, in ſhort, any thing may produce any thing, and no concluſion with reſpect to the cauſe can be drawn, in any caſe, from what we ſee in the effect.—The effects of habits have been very improperly alleged, as affording inſtances of regular action, without knowledge of deſign. For, what is done by habits, is, I think, always done in conſequence of ſome volition or direction of the mind; and our not being conſcious of it is in reality no more than not remembering it, the whole effect of a habit on the executive powers conſiſting in their more eaſy and ready compliance with the dictates of the mind. But not to inſiſt on this; let it be granted that regular actions are frequently performed in conſequence of habits, without thought or deſign: this, if true, muſt be owing to certain powers and laws of the animal economy, which muſt be accounted for in the ſame manner with other powers and laws which obtain in nature, and cannot be made an argument for ſuch a blind plaſtic force as has been contended for, without begging the queſtion. See the truly great and learned Dr. Cudworth's Intellectual Syſtem, book i. ch. 3, where the opinion on which I have made theſe remarks is particularly explained and defended. See alſo an account of a controverſy which it occaſioned between Mr. Bayle and Le Clerc, in the account of the life and writings of Dr. Cudworth, prefixed to the ſecond edition of the Intellectual Syſtem by Dr. Birch. Dr. Henry More and Dr. Grew have likewiſe maintained this opinion." Intell. Syſtem, vol. i. p. 147, &c. Birch's ed. More's Imm. of the Soul, lib. iii. cap. 12. Price's Diſſ.

PLASTICE, Πλαστικη, the plaſtic art, a branch of ſculpture; being the art of forming figures of men, birds, beaſts, fiſhes, plants, &c. in plaſter, clay, ſtucco, or the like.

The workmen concerned in this art are alſo called *plaſtæ*, πλασται.

Plaſtice differs from carving, becauſe here the figures are made by addition of ſomething that is wanting; but in carving, always by ſubtraction of what is ſuperfluous.

The plaſtic art is now chiefly uſed, among us, in fretwork ceilings; but the Italians apply it alſo to the mantlings of chimnies with great figures.

PLASTRON, in *Ancient Military Armour*, a breaſtplate of forged iron occaſionally put on, under or between the hauberk and gambeſon.

Plastron is alſo a piece of leather ſtuffed, uſed by fencing-maſters, on which to receive the puſhes made at them by their pupils.

PLASWIG, in *Geography*, a town of Pruſſia, in the province of Ermeland; 28 miles N.W. of Heilſberg.

PLAT, a popular term, among *Mariners*, &c. for a ſea-chart.

Plat, in *Rural Economy*, a term provincially applied to the mould-board of a plough.

Plat-*Veins*, in the *Manege*, called in French *ars*, are the veins in which we bleed horſes, one in the lower part of each ſhoulder, when we bleed a horſe in the ſhoulders; and in the flat part of the thighs.

Plats, in a *Ship*, flat ropes made of rope-yarn, and twiſted into *ſexes*; they ſerve to ſave the cable from galling in the hawſe, or to wind about the flukes of the anchors, to ſave the pennant of the fore-ſheet from galling againſt them.

PLATA, Plate, in *Commerce*, a Spaniſh term, ſignifying ſilver; as vellon, which they pronounce vellion, ſignifies copper. Theſe two terms are not only uſed to expreſs the ſpecies of thoſe metals ſtruck in Spain, but alſo to diſtinguiſh between their ſeveral monies of account. Plate is reduced to vellon by ſaying, as 17 is to 32, ſo is the given plate to the vellon ſought; and *vice verſâ*. See Exchange; ſee alſo Maravedi and Real.

Plata, *La*, or *Buenos Ayres*, in *Geography*, a vice-royalty belonging to the Spaniſh dominions in South America, erected in 1778 (not in 1776, as ſtated under the article Buenos *Ayres*, from authorities to which we had then acceſs), is one of the moſt important diviſions, and that by which the chief opulence of the Spaniſh dominion in this part of the world paſſes to the parent country, and is interwoven with the commerce and intereſts of Europe. Including the ſavage Chiquitos and Mojos in the north, and extending to the ſouthern limits of Tuyu and the wide plains called the Pampas, its length from the chain of Vilcanota to the vicinity of the river Negro, may be aſſumed from 14° S. lat. to near 38°, that is 24°, or 1440 geographical miles. Eſtalla ſtates the boundary between La Plata and Peru to be now the cordillera of Vilcanota, dividing the province of Carabaya in La Plata from that of Canes and Canches in Peru.

The breadth of La Plata, which is generally pretty equal, may be computed at 12°, or 720 geographical miles. Eſtalla, cited by Pinkerton, computes the extent at 1000 Spaniſh or rather American leagues (ſeeming vaguely to include Chili), and the greateſt breadth at 350, forming a triangle of 1000 leagues in height, on a baſe of 350, equal to 175,000 ſquare leagues; which, as he adds, might ſupport 50,000,000 perſons, while in fact there is ſcarcely one million of civilized inhabitants, and ſome few ſavages. Before the eſtabliſhment of this vice-royalty, the greateſt part of the juriſdiction belonged to that of Peru; although the three provinces of Buenos Ayres, Paraguay, and Tucuman, were conſidered as "Capitanias Generales," that is, the governors had an authority independent of the viceroys of Peru, except in caſes of great importance and difficulty.

The

The part of Peru now annexed to La Plata was divided into well-known provinces or diſtricts; and the miſſions of the Chiquitos, Mojos, and Guaranis, formed three diſtinct governments. The form of government in this new vice-royalty remained the ſame, though its title was changed. The ordinance of his Catholic majeſty for the ſub-diviſion of the vice-royalty was iſſued in 1782, and appointed nine intendancies. Eſtalla ſays that this vice-royalty is divided into nine intendancies, namely Buenos Ayres, compriſing the whole of that biſhopric; the biſhopric of Tucuman embracing two intendancies, that of Salta, and that of Cordova, to which is joined the province of Cuyo-y Mendoza, which, with regard to ſpirituals, is ſubject to the biſhopric of Chili: in former Peru, there are five intendancies, Potoſi, Plata, Puno or Paucarcola, La Paz, and Cochabamba on the S.E. of La Paz; and from the remaining deſcription, which is rather confuſed, it would appear that Santa Cruz de la Sierra forms the ninth intendancy; but there is alſo an intendant of Paraguay.

Mr. Pinkerton, for the purpoſe of a geographical deſcription of this vice-royalty, enumerates the principal provinces, proceeding from the ſouth, which are as follow:

1. Pampas,	16. Plata,
2. Tuyu,	17. Santa Cruz de la Sierra,
3. Buenos Ayres,	18. Chayanta,
4. Cordova,	19. Oruro and Paria,
5. Cuyo and Mendoza,	20. Carangas,
6. Charcas,	21. Pacajes,
7. Guarania,	22. La Paz,
8. Paraguay,	23. Cochabamba,
9. Chaco,	24. Sicaſica,
10. Salta,	25. Laricaja and Omaſuyos,
11. Jujuy,	26. Chucuito,
12. Chichas and Tarija,	27. Puno or Paucarcola,
13. Lipes,	28. Lampa,
14. Atacama,	29. Aſangaro,
15. Potoſi or Porco,	30. Carabaya, which is the

laſt province of La Plata on the N. of the great lake of Titicaca, ſeparated from the Peruvian province of Canes and Canches by the grand chain of the cordillera called Vilcanota.

Eſtalla has briefly deſcribed the upper and inferior parts of the vice-royalty, as he calls them. The former part is peculiarly rich in the precious metals, yielding only to Mexico in this reſpect, and he particularly mentions the cordillera of Lipes; and to Porco belong the celebrated mines of Potoſi. The metals of Oruro and Paria are alſo celebrated. The provinces moſt rich in gold are Laricaja and Carabaya; while thoſe that produce the greateſt quantity of ſilver are Lampa, Puno, Chucuito, Oruro, Chayanta, and Chicas, not to mention Potoſi. Carangas and Pacajes are famous for the breed of pacos, which are uſed as beaſts of burden. Lampa and Aſangaro are noted for the produce of wool, the ſheep in the former being eſtimated at near a million. Theſe diſtricts, together with Chucuito, alſo rear cattle and horſes. In the provinces of Salta and Jujuy mules form a prodigious article of trade, ſuppoſed to yield 200,000 dollars annually. Cochabamba produces abundance of wheat and maize, ſo as to ſupply Oruro, La Paz, and other upland provinces. Santa Cruz de la Sierra, which ranks among the warm regions beneath the chain of mountains, trades in honey, ſugar, and beer. In the lower part of the vice-royalty, Eſtalla obſerves that the province of Buenos Ayres comprehends three other cities beſides the capital, namely, Montevideo, Corrientes, and Santa Fé. The chief products of this province are beeves and mules. For an account of Buenos Ayres, we refer to that article; here adding ſome particulars which have come to our knowledge ſince that article was written. In conſequence of the creation of the new vice-royalty, there has been a great increaſe of commerce and agriculture, and many other advantages have contributed to its progreſſive proſperity. Formerly its inhabitants had no country-houſes, nor any other fruits than a kind of peach; but now every perſon in eaſy circumſtances has a country cottage and garden, with a variety of fruits, garden plants, and flowers. The houſes, though not elevated, are convenient and well furniſhed. The women are celebrated among the moſt beautiful in America; and though their dreſs is leſs expenſive than that of thoſe of Lima, it is more agreeable and elegant. The cathedral has been lately rebuilt; it has three naves, beſides ſeveral chapels; and in 1798 it had coſt half a million of dollars, and the expence of completing it would be as much more. A college is opened, that of San Carlos, which is ſaid to contain 100 ſtudents. The eccleſiaſtical eſtabliſhment conſiſts of a biſhop and ſome dignitaries; the pariſh churches are ſix, and the convents are numerous. Here are two hoſpitals for orphan children, one of which receives foundlings; and here is alſo an aſylum for women of the town, and in the vicinity are ſeveral hermitages and little chapels. The population, which is daily on the increaſe, is ſuppoſed to be about 40,000 perſons, of whom the whites or Spaniards compoſe one half, the other half conſiſting of negroes, mulattoes, and ſome few Indians from other parts. Of the Spaniards, ſome are creoles, born in the country of white parents, and all are chiefly employed in commerce, the arts, and agriculture, while the people of colour are moſtly ſervants. The merchants form the chief part of the population, and of theſe the greater number is compoſed of ſuch as are not natives. The inhabitants of Buenos Ayres are, according to Eſtalla, of a ſedate turn, affable and polite. A theatre is eſtabliſhed. Bull fights, which were formerly held in the great ſquare, are aboliſhed. Both ſexes are handſome, having agreeable countenances, and wearing the Spaniſh dreſs. The ladies are fond of muſic, with which they amuſe themſelves and their company. Their ſtockings are fancifully embroidered with gold. The religious proceſſions of this city are numerous and ſplendid. From Spain, and chiefly from Cadiz, are imported moſt of the neceſſaries, as ſilks, woollens, cotton, linen, hats, &c. They are debarked at Montevideo, and carried in boats to Buenos Ayres, whence they may paſs to any part of the vice-royalty, paying 4 *per cent.* on the ſale if carried to the frontier provinces, and 6 *per cent.* in other caſes. The merchants are eſteemed men of character and good credit. If Buenos Ayres were not the capital of the province, and at preſent the great mart of Peruvian commerce, its trade would be inconſiderable, becauſe it has no great branch of native exportation. But the fertility of the neighbouring provinces may in time incline the balance in its favour; and the leather, wool, wheat, tallow, may yield conſiderable revenues to the vice-royalty. The market of Buenos Ayres is abundantly ſupplied with all kinds of plants, fruits, meat, bread, fiſh, fowl, milk, &c. Eſtalla ſays, that nearly 1000 head of cattle are ſlain in the neighbourhood for the daily uſe of the city: fiſh is alſo abundant; but clear water is wanting. The climate is leſs healthy than that of Montevideo, and the calentures or fevers are pernicious. The city is not deficient in coffee houſes, confectionary ſhops, and taverns; but ice and ſnow are wanting. The viceroy is lodged in the fortreſs, in which are alſo the new royal audience, the royal treaſury, the chapel, guard-houſe, and various magazines. The guild-hall is a large building, raiſed on pillars of brick, where the judges hold the ſeſſions, and underneath is is the gaol. The environs, especially towards Cordova, are pleasant, being full of gardens and groves, diversified with fields of wheat and maize. Cattle are abundant. See BUENOS AYRES. For an account of Montevideo, Santa Fé, Corrientes, Potosi, La Paz, Mendoza, Cordova, Tucuman, Salta, Cuyo, Rioja, the Guaranis, Paraguay, the Pampas, Chucuito, Puno, Oruro, Santa Cruz, Jujuy; see the several articles.

The government of La Plata is entrusted to a viceroy, who has also the title of captain-general, with an assessor, and a fiscal, and also a secretary. The jurisdiction of the viceroy comprehends the whole political management, except the royal treasury, to which his authority does not extend. In the military department he is commander-in-chief under the sovereign. The assessor is also auditor, or supreme judge; and his military jurisdiction is that of captain-general of the veteran troops. The salary of the viceroy is 40,000 dollars; but after certain deductions the residue is about 30,000. He is nominated for three years. The salary of the assessor, fiscal, and secretary, is between 2 and 3000 dollars each. The viceroy is supreme president of the royal audience of Charcas, and also of the new royal audience, erected in 1785, at Buenos Ayres. He exercises the royal vice-patronage, and as such has a grand seat and canopy in the cathedral, where he is treated with the same ceremonies as are paid to the monarch. The royal treasury acknowledges as its chief the intendant of the army; he has a salary of 10,000 dollars; and he audits all the accompts of the vice-royalty. The essential branches of the administration of the royal treasury at Buenos Ayres are the customs, the deposits of tobacco, the monopoly of which has sometimes yielded 100,000 dollars a-year, playing cards and stamped paper, which are of little consequence. Similar duties are exacted in the principal cities of the vice-royalty, and 4 *per cent.* arises from the sale of merchandise. But the chief branch of the revenue is the duty called *fifths*, though in fact the *tenth* only of all metals. There is also a capitation tax from eight to ten dollars, paid by each person. However, the royal expences are great: the pay of the military, the charges of the sales, and the salaries of the officers of the customs and of tobacco, are prodigious. The intendants of the provinces manage in their jurisdictions the administration of justice, of the police, of the revenues, and of war. In Paraguay, Tucuman, and Santa Cruz, they have joined the command of the troops. The governors intendants have a salary of 6000 dollars, and 600 for the expence of the secretariate and visiting their province. The intendant of Potosi, who is also director of the mint, and of the bank, has a salary of 10,000 dollars. The assessor, appointed by the king to assist these intendants in the administration of justice, has a salary of 1000 dollars, derived from the law-suits, and 500 from the treasury, those of the general intendancy excepted, who have 1000.

Besides the nine intendancies there are four governments in the vice-royalty of La Plata, *viz.* that of Montevideo, political and military; and those of the Guaranis, Chiquitos, and Mojos, who have great power military and civil. The establishments on the Patagonian coast, and the Maluinas, or Falkland islands, are subject to particular instructions. Estalla computes the population of this extensive vice-royalty at 1,000,000 Spaniards or creoles, and an inconsiderable number of savages. The population of the other two vice-royalties, *viz.* Peru and New Granada, probably does not exceed $2\frac{1}{2}$ millions. That of Caracas, by the account of Depons, amounts to 728,000, including whites, negroes, and Indians; and Chili can scarcely exceed the number necessary to complete a million. Brazil, by the best accounts, contains 200,000 whites, and 600,000 negroes, while the natives are little more than sufficient to complete another million. The whole number, therefore, will yield $5\frac{1}{2}$ millions; nor can more, it is thought, than 6 millions be allowed for the general population of the whole of South America.

The internal commerce of this vice-royalty is conducted by means of covered carts or small waggons drawn by oxen, and these form caravans for security against the attacks of the savages. The chief journies are from Buenos Ayres to Jujuy and Mendoza; beyond which stations it is necessary to have recourse to mules, as the country becomes mountainous. This trade supports many individuals, and increases the circulation of money. The freedom of trade, granted in 1778, contributed very much to augment the general commerce of La Plata; and by a royal ordinance of the 10th of April, 1793, it was permitted, that salted meat and tallow might pass to Spain, or the other colonies, free from duties; a privilege, which had before been granted to the trade in negroes, who were found necessary for the cultivation of the country.

The increase of commerce in this vice-royalty has had a beneficial effect on the agriculture of the country. A royal schedule, in 1791, granted to Spaniards and foreigners the right of introducing negroes, and instruments of agriculture; nor is it improbable, as our author (Estalla) conceives, that this wide and fertile vice-royalty may become, in a few years, not only the granary of the other Spanish colonies, but of the parent country, by the extreme fertility of its soil, and the excellent regulations that are adopted. The climate is singularly benignant, and the extent of fertile lands immense, watered by innumerable rivers and rivulets, which join the majestic waves of the Paraguay and the Parana. The farms, stations, and inclosures for breeding beeves, horses, mules, sheep, &c. are already so numerous that they may be counted by millions. Salt rivers and lakes, with numberless creeks, afford convenience for loading boats with salted meat, and the natives are distinguished by their activity and industry. Some districts of the missions produce cotton, lint, and flax; and there are mines of gold at Maldonado and San Luis, 200 leagues from the capital. Although agriculture, fishery, the chace, and the mines serve to enrich these provinces, yet no object is more useful than the breeding of cattle, and we may form some judgment of the number by that of the skins imported. In 1792, 825,609 hides of beeves were carried to Spain, besides those sent to the coast of Brazil, and for the purchase of negroes, &c.

The botany of the provinces of this vice-royalty, which formerly belonged to Peru, may be found in the Flora Peruana; and that of the central, southern, and eastern provinces, may be supplied from the work of the industrious Dobrizhoffer, who has, in his first volume, given a general natural history of Paraguay. For a sketch of the botany and zoology, see PARAGUAY.

The mines form a grand object in the new vice-royalty, and are found chiefly in the provinces formerly considered as Peruvian; for, in fact, Charcas, Tucuman, and Buenos Ayres, were all regarded as dependencies of Peru, before the grand change in the year 1778. The upper part of the vice-royalty of La Plata very justly deserves the appellation given to the vice-royalty, as it is the richest country in silver which has yet been discovered on the globe. The mines of gold and silver may be said to be innumerable. All the northern provinces teem with mineral opulence: while Laricaja and Carabaya are distinguished by virgin gold.

gold. (See POTOSI.) Befides gold and filver, copper is found at Articoya near Oruro, and in the diftrict of Lipes. A rich mine of tin is wrought in the diftrict of Paria; and mines of lead abound in the province of Chichas.

The following is the ftate of the mines in the new viceroyalty of Buenos Ayres, as reported by Helms.

Provinces.	Gold.	Silver.	Copper Mines.	Tin.	Lead.

Pinkerton's Geography, vol. iii. ed. 1807.

PLATA, *La*, a province of the above defcribed viceroyalty. Its capital of the fame name was formerly a city of Peru and the fee of an archbifhop. It was built by captain Pedro Anzures in the year 1539, by order of Gonzalo Pizarro, on the fcite of Chuquifaca, and called Plata, in allufion to the filver mines of the mountain of Porco in its neighbourhood, from which the Incas obtained great quantities of filver. Its ancient name long prevailed, and, as Ulloa fays, is now commonly ufed. This city ftands on a fmall plain environed by eminences, which defend it from the winds. In fummer the temperature of the air is very mild, nor is there any great difference throughout the year; but in winter, which here begins in September and continues till March, tempefts of thunder and lightning are very common, and rain is of long continuance. The houfes are covered with tile, having one ftory befides the ground floor; they are roomy and convenient, and have delightful gardens planted with the fruits of Europe. Water is fcarce. The inhabitants confift of Indians and Spaniards, and are faid to amount to 14,000. The cathedral is large, of good architecture, and finely adorned with paintings and gildings. The parifh is ferved by two priefts, one for the Spaniards, and one for the Indians. Another parifh, fituated at one end of the city, is appropriated to the Indians living within its precinct, and amounting to about 3000. The convents of the Francifcans, Dominicans, Auguftines, the fathers of Mercy, and the college of Jefuits, are fpacious buildings, with fplendid churches. Here are alfo two nunneries, and an univerfity dedicated to St. Francis Xavier, the rector of which is always a Jefuit: and alfo two other colleges, in which lectures of all kinds are read. The magiftracy confifts of regidores, who are perfons of the firft diftinction, with a corregidor at their head; from thefe are annually chofen two ordinary alcaldes for fuperintending the police. Plata was erected into a bifhopric in 1551, and in the year 1608 was raifed to a metropolis. The jurifdiction of this city includes the imperial town of Potofi, which fee. Juan and Ulloa's Voyage, vol. ii. S. lat. 19° 40′. W. long. 66° 46′.

PLATA, *Rio de la*, or river of Silver, a river of South America, which is the conjunct flood of the Paraguay, the Pilcomayo, the Parana, and the Uruguay. The main ftreams are the Paraguay and the Parana, which fee refpectively. This river was firft difcovered by Juan Dias de Salis, in the year 1515, who failed up the ftream as far as an ifland, which lies in S. lat. 34° 40′. The mouth, nearly 60 leagues broad, is fuppofed to have been called La Plata from the great quantity of filver found by thofe who firft vifited the countries adjacent to its banks; though it was originally called the river Salis, from its firft difcoverer, who, obferving fome Indian tents as he failed up the river, imprudently went on fhore with ten men, who were all murdered by the favages. The river Plata, receiving confiderable ftreams, fometimes fwells to fuch a degree, that the banks on each fide are overflowed, like thofe of Egypt by the inundation of the Nile, and thus rendered remarkably fertile. The current of the river, where it falls into the fea, is fo rapid, that the water is frefh fome leagues diftant from its mouth. Its water is alfo clear, fweet, and wholefome. It abounds with great plenty and variety of fifh; and its banks are frequented by a number of very beautiful birds. The diftance from the conflux of the Paraguay and Parana to the mouth of the river is near 600 miles, and this interval is interfperfed with delightful iflands, and navigable by the largeft fhips. See PARANA.

PLATA, *La*, a fmall ifland in the Pacific ocean, near the coaft of Peru. S. lat. 1° 10′.

PLATA, *La*, or *Sebaftian del Oro*, a town of South America, in the province of Popayan; 60 miles E. of Popayan. N. lat. 2° 50′. E. long. 75°.

PLATA *Keys*, a large fand-bank among the Bahama iflands, about 40 miles N. of Hifpaniola.

PLATÆ, a word ufed by fome anatomical writers to exprefs the fcapulæ.

PLATÆA, in *Ancient Geography*, an ifland of the Mediterranean, on the coaft of Lybia, whither, according to Herodotus, the Cyrenians fent a colony. It was fituated on the coaft of the Giligammes, in the midway between that coaft and the ifle of Aphrodifias. Scylax places it on the coaft of Marmarica.

PLATÆÆ, a town of Greece, in Bœotia. Homer writes this name in the fingular Πλάταια, Platæa; but the hiftorians write it Πλαταιαί. It was fituated on the river

 Afopus;

Afopus; and feems to have derived its name from Platea, the daughter of an ancient king of the country, who had given his own name to the river Afopus.

The firft military exploit of the Platæans, of which we have any knowledge, occurred at Marathon, where they effectually aided the Athenians; they afterwards diftinguifhed themfelves on many occafions; but after having experienced the calamities of many wars, and having been frequently driven from their city and recovered it, their ruin was accelerated by Philip, after his victory in the battle of Cheronæa. Near the walls of this city was the tomb of thofe Platæans who had fallen in combating againft the Perfians. The other Greeks had alfo a common fepulchre, whilft the Athenians and Lacedæmonians had another apart for themfelves. Jupiter *Liberator* had an altar near the common burying place of the Greeks; both the robes and the ftatue of the god were of white marble. The Platæans inftituted games, which they celebrated every fifth year, on which occafion they ran armed before the altar of Jupiter. The temple of Juno was very fplendid and highly ornamented; her ftatue was of an extraordinary fize, and executed by Praxiteles of Pentelician marble. Minerva had alfo a temple at Platæa, which had been erected of the fpoils gained from the Perfians in the battle of Marathon. Her ftatue was the work of Phidias, and was not lefs in fize, than that of bronze in the citadel at Athens. In this city was alfo the tomb of Leitus, who was the only Bœotian chief who returned from the fiege of Troy.

PLATALEA, the *Spoon-bill*, in *Ornithology*, a genus of birds of the order Grallæ. The generic character is this: the bill is long and thin; the tip dilated, orbicular, flat; the noftrils are fmall, and at the bafe of the bill; tongue fhort, pointed; the feet are four-toed and femi-palmate. There are three

Species.

* Leucorodia; White Spoon-bill. Body white; chin black; hind-head fub-crefted. The bill is black, brown, or fpotted; tongue heart-fhaped; irids grey; lores, orbits, and naked dilatable chin black; quill-feathers fometimes tipt with black; the legs are black. There are two varieties of this fpecies, of which the *firft* has the wings varied with black and white, the legs yellowifh; in the *fecond* the body is all white; legs flefh-colour. The white or common fpoon-bill weighs about three pounds and a half, and meafures two feet eight inches in length. It inhabits from the Feroe iflands to the Cape of Good Hope; it is rarely feen in England, but its appearance is fufficiently frequent to juftify us in placing before it the afterifk. It lives on grafs, carices, the roots of reeds, ferpents, frogs, mufcles, and other fhell fifh; but efpecially on fifhes, which it often feizes from other birds. It makes its nefts in high trees, near to the fea, and lays three or four white eggs, fpeckled with pale red fpots. The flefh of the young fpoon-bill is reckoned very good, little inferior to that of the goofe.

Ajaja; Rofeate Spoon-bill. Body rofe coloured; tail-coverts fcarlet. There is a variety blood-red; neck white; collar black; tail-feathers fcarlet. It inhabits South America, and is twenty-feven inches long.

Pygmæa; Dwarf Spoon-bill. Body above brown, beneath white. It is only the fize of a full-grown fparrow, and is found in Guiana and Surinam.

PLATAMON, a word ufed to exprefs a low and fmooth rock, juft appearing above water.

PLATAMONE, in *Geography*, a town of European Turkey, in Macedonia, at the mouth of the river Jenicoro; 44 miles S.S.E. of Edeffa.

PLATANAL, a fmall ifland in the Spanifh main, near the coaft of Darien. N. lat. 9° 6′. W. long. 80° 40′.

PLATANARIA, in *Botany*, a name by which fome authors have called the *fpargarium*, or burr-reed, from its round echinated fruit, which in fhape and fize much refemble thofe of the platanus.

PLATANI, in *Geography*, a river of Sicily, which rifes near Caftro Nuovo, and runs into the fea, 10 miles S. of Sacca.

PLATANUS, in *Ancient Geography*, a town of Afia, in Syria; fituated on the weftern bank of the river Orontes, E. of mount Cafius, towards N. lat. 35° 50′.—Alfo, a town of Phœnicia, placed by M. d'Anville between Berytus and Sidon, in the vicinity of Libanus.

Platanus, in *Botany*, the claffical name of the Plane-tree, adopted by the Romans from the Greeks, whofe πλατανος was derived from πλατυς, *broad*, in allufion to the wide fpreading branches, and umbrageous foliage, of this noble and favourite tree. — Linn. Gen. 498. Schreb. 649. Willd. Sp. Pl. v. 4. 473. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 5. 304. Purfh North Amer. v. 2. 635. Juff. 410. Lamarck Illuftr. t. 783. Gærtn. t. 90.—Clafs and order, *Monoecia Polyandria*. Nat. Ord. *Amentaceæ*, Linn. Juff.

Gen. Ch. Male flowers compound, difpofed in a globular catkin. *Cal.* A few flight minute fegments. *Cor.* fcarcely difcernible. *Stam.* Filaments oblong, fwelling upwards, coloured; anthers fquare, furrounding the lower part of the filament.

Female flowers numerous, forming a globe, on the fame tree. *Cal.* of feveral minute fcales. *Cor.* Petals feveral, concave, oblong, club-fhaped. *Pift.* Germens feveral, awl-fhaped, ending in awl-fhaped ftyles; ftigma fimple, recurved. *Peric.* none; feveral fruits are collected together into a globe. *Seed* roundifh, tapering at the bafe, crowned with the awl-fhaped permanent ftyle, the bottom of the feed being furrounded with copious capillary down.

Obf. Linnæus fubmits his defcription of the flowers to the more attentive fcrutiny of "fome lynx-eyed obferver," but no one as yet has taken up the challenge. Mr. Bauer's fine drawing of *P. orientalis*, for the Flora Græca, has no male flowers.

Eff. Ch. Male, Catkin globofe. Calyx and corolla obfolete. Anthers furrounding the filament.

Female, Catkin globofe. Calyx of many leaves. Corolla none. Stigma recurved. Seed club-fhaped, pointed by the ftyle, briftly at the bafe.

1. P. *orientalis*. Oriental Plane Tree. Linn. Sp. Pl. 1417. Willd. n. 1. Ait. n. 1. (Platanus; Ger. Em. 1489. Matth. Valgr. v. 1. 120. P. orientalis verus; Duham. Arb. v. 2. 172. t. 33.)—Leaves palmate, five-lobed; wedge-fhaped at the bafe: fegments lanceolate, finuated: ribs pedate. Stipulas nearly entire.—Native of the Levant.—A fpecimen in the Linnæan herbarium was gathered by Haffelquift, from a remarkably large tree, in the ifland of Cos, now Stanchio, the circumference of whofe trunk was thirteen and a half Swedifh ells, about eight yards and a half. This beautiful fpecies is among the earlieft exotic trees recorded to have been cultivated in Britain, being mentioned by Turner in 1548; but the great lord Bacon appears to have been the firft who planted it in any abundance. The Greeks and Romans efteemed this tree very highly for its fhade, as well as beauty. About the Roman villas it was always planted, and fometimes honoured, rather than benefited perhaps, with libations of wine. Some ancient trees of this kind are reported to have attained a more ample fize than the above.

above. The fineft Oriental Plane, we believe, in England, ftands at one corner of Chelfea garden, raifing its round head far above all neighbouring objects. Miller fpeaks of this as the Maple-leaved variety, now made a fpecies, fee n. 3; and he afferts, that young plants, which fprung from its feeds, proved of the common fort. We have no opportunity at prefent of inveftigating this point. An elegant fpecimen of the Oriental Plane, whofe fpreading branches are feathered down to the ground, ftands near the temple in the arboretum at Kew. In Germany, this fpecies is not hardy enough to attain the fize of a tree. The *branches* of *P. orientalis* are round, fmooth, flightly zigzag. *Leaves* deciduous, alternate, on longifh, round, downy *ftalks*, rather deeply palmate, about a fpan wide, with five lanceolate, more or lefs deeply or copioufly finuated, lobes, whofe points are callous or glandular, and fomewhat incurved: both fides are fmooth, with pedate ribs, and innumerable fine veins: in an early ftate only, the leaves are clothed with mealy deciduous down. *Stipulas* tubular, furrounding the branch, with a fpreading border, more entire in this fpecies than the reft. *Buds*, as in the whole genus, enclofed in the hollow bafe of each *footftalk*, ovate, obtufe, compreffed, quite concealed till the leaves fall. By their fwelling, the buds promote the feparation of the footftalks. *Flowers* in three or four globular heads on each long drooping ftalk, appearing in April and May. *Stigmas* crimfon. Each globe of ripe *fruit* is an inch or more in diameter.

2. P. *cuneata*. Wave-leaved Plane Tree. Willd. n. 2. Ait. n. 2. (P. orientalis undulata; Ait. Hort. Kew. ed. 1. v. 3. 364.)—Leaves three or five-lobed, toothed; wedge-fhaped and elongated at the bafe; triple-ribbed, nearly fmooth.—Gathered by Haffelquift in the Levant. Miller is faid to have cultivated it in 1739. In fome points this anfwers to his "Spanifh, or Middle Plane Tree;" but we find great difficulty in applying with certainty the Englifh names of this genus, which are in ufe amongft nurfery-men. The *leaves* in our wild fpecimen are remarkably wedge-fhaped, and elongated at their bafe; in confequence of which there are only three principal ribs, of which the lateral ones are feldom precifely oppofite: the lobes are three, ftrongly finuated, but not feparated fo far as the middle of the leaf. *Footftalks* long. Miller defcribes them fhort, and covered with fhort down, in his Spanifh Plane, which character anfwers to another fpecimen in the Linnæan herbarium from Burgundy, refembling the true *orientalis*, except in its fhort *footftalks*, and ftrongly toothed *ftipulas*. This fpecimen may be a nondefcript fpecies. The leaf in Duham. Arb. v. 2. t. 34. given for the following, reprefents our plant very well.

3. P. *acerifolia*. Maple-leaved Plane Tree. Willd. n. 3. Ait. n. 3. (P. orientalis aceris folio; Tourn. Cor. 41.)—Leaves heart-fhaped, five-lobed, fmooth, diftantly toothed; abrupt and three-ribbed at the bafe.—Native of the Levant, where it was noticed by Tournefort. The Hort. Kew. mentions this fpecies as cultivated here before 1724. Willdenow fays it is hardy, forming a lofty tree, in Germany, and that it is known from all the reft by the *leaves* being abrupt, not wedge-fhaped at the bafe, and having their two lateral ribs fpring from the top of the *footftalk*, unaccompanied by any leafy expanfion beyond them. He adds, that they are extremely like thofe of the Sugar Maple, *Acer faccharinum*. We have no fpecimen that anfwers to this defcription, nor does Duhamel's t. 34, given as Tournefort's plant, agree with Willdenow's account.

4. P. *occidentalis*. American Plane Tree. Linn. Sp. Pl. 1418. Willd. n. 4. Ait. n. 4. Catefb. Carolin. v. 1. 56. t. 56. Duham. Arb. v. 2. 172. t. 35.—Leaves with five angles, flightly lobed, toothed; wedge-fhaped at the bafe; downy beneath.—Native of the banks of rivers in North America, from Canada to Florida, as well as in Louifiana. Mr. Purfh fays this is perhaps the largeft North American tree, fome individuals, on the fertile banks of the Ohio and Miffifippi, meafuring from ten to fixteen feet in diameter. It is known by the names of Buttonwood, Water Beech, Sycamore, and Plane Tree; in Canada by that of Cotton Tree. This Plane has been cultivated in England about 180 years, and is ufually hardy with us, as well as in Germany, flowering like the other fpecies in April and May; but the winter of 1810, or fpring of 1811, was fatal or injurious to moft of the Occidental Planes in England, owing perhaps to tranfient cold, not generally obferved, at fome critical period of the growth of thefe trees in particular. The broad, flightly lobed foliage diftinguifhes this fpecies readily from all the reft. The three or five principal ribs have a confiderable leafy, though fcarcely wedge-fhaped, expanfion below the point of their union. The *ftipulas* are wavy, with blunt fhallow teeth. *Footftalks* rather fhort, downy.

Platanus, in *Gardening*, contains plants of the exotic deciduous tree kind, of which the fpecies cultivated are; the oriental plane tree (P. orientalis); and the American plane tree (P. occidentalis).

Of the firft fort there are two varieties, as the *maple-leaved*, which has not its leaves fo deeply cut as thofe of the eaftern plane: they are divided into five fegments, pretty deep, but are not lobed, like thofe of the occidental plane. The petioles are much longer than in either of the fpecies, and the upper furface of the leaves is rougher, fo that they might be taken for different forts, if it was not known that they rofe from the fame feeds.

The *Spanifh* plane, which has larger leaves than either of the forts, and are more divided than thofe of the occidental, but not fo much as thofe of the oriental. Some of the leaves are cut into five, and others into three lobes only; thefe are fharply indented on the edges, and are of a light green; the footftalks are fhort, and covered with a fhort down. This is by fome called the middle plane tree, from the leaves being of a fhape between the two fpecies.

Method of Culture.—Thefe plants may be increafed by feed, layers, and cuttings; but principally in the two laft methods.

The beft feafon for fowing the feed is autumn, if they can be procured, otherwife in the fpring, upon a fomewhat lightifh mellow foil: the ground having been dug and raked, it fhould be formed into four-feet wide beds, and the feeds then fcattered evenly on the furface, and raked in, or with the back of a rake the earth be previoufly trimmed off the furface near half an inch deep into the alleys; then fowing the feed, and directly with the rake turned the proper way, drawing the earth evenly over the feeds, and trimming the furface fmooth, when many of the plants will rife in fpring, but probably not generally till the fpring following. When they are one or two years old, they fhould be planted out in nurfery-rows, two feet afunder, and about half that diftance in the lines; to remain till of a proper fize for being finally fet out.

In the layer method, fome ftout plants muft be planted for ftools, which in a year after muft be headed down near the bottom, that they may throw out many fhoots near the ground convenient for laying; which, in the autumn after they are produced, fhould be laid down by flit-laying; and by the autumn after they will be well rooted, and form plants

plants two or three feet high, which may be ſeparated, and planted in nurſery rows, as the ſeedlings. They ſucceed very readily in this way.

Moſt of the ſorts take tolerably by cuttings of the ſtrong young ſhoots; but the latter more freely than the former kinds. The moſt proper ſeaſon for planting them is the autumn, as ſoon as the leaf falls, or occaſionally in the ſpring; chooſing a moiſt ſoil for the purpoſe, when many of the cuttings will grow, and make tolerable plants by the autumn following.

Theſe laſt two methods are the only ones in order to continue the diſtinct varieties effectually.

Theſe trees have a very ornamental effect in all ſorts of plantations, from their large growth and the great ſize of their leaves.

PLAT-BAND, a border or bed of flowers, along a wall, or the ſide of a parterre; frequently edged with box, &c.

Plat-band, in *Architecture*, is any flat ſquare moulding, whoſe height much exceeds its projecture.

Such are the faces, or faſciæ, of an architrave, and the plat-bands of the modillions of a cornich.

The plat-band is ſignified in Vitruvius, and others, by the words *faſcia*, *tænia*, and *corſa*.

Plat-band of a door or window, is uſed for the lintel, where that is made ſquare, or not much arched.

Theſe plat-bands are uſually croſſed with bars of iron when they have a great bearing: but it is much better to eaſe them by arches of diſcharge built over them.

Plat-bands of flutings, the liſts, or fillets, between the flutings of columns.

PLATE, in *Commerce*, denotes gold or ſilver wrought into veſſels for domeſtic uſes.

Plate, in *Geography*, a town of Hinder Pomerania, on the Rega; 22 miles S. of Colberg. N. lat. 53° 49′. E. long. 15° 17′.

Plate, in *Heraldry*, is a round flat piece of ſilver, without any impreſſion; but, as it were, formed ready to receive it.

The term is uſed only by the Engliſh heralds. In other nations they are known by the name of *beſants argent*.

Plate-*Mail*, in *Ancient Armour*. See Mail.

Plate-*Armour*, formed of ſmall round plates of iron, like the ſcales of a fiſh, was known and uſed among the ancients. There are many ſpecimens of Roman plate armour in the muſeums of curious collectors. If the ſuit of armour, ſhewn in the Tower of London, be really what it is ſaid to have been, the armour of John de Courcy, earl of Ulſter, in Ireland, brought with him to the Tower; it will prove that plate-armour was in uſe as early as 1204, the date of his confinement. The general prevalence of it was checked by the large ſum which a complete ſuit of plate-armour coſt. It was, however, introduced both here and in France into more common uſe about the middle of the 14th century.

Plate, a term uſed by our *Sportſmen*, to expreſs the reward given to the beſt horſe at our races.

The winning of a plate is not the work of a few days to the owner of the horſe, but great care and preparation are to be made for it, if there is any great dependence on the ſucceſs. A month is the leaſt time that can be allowed to draw the horſe's body clear, and to refine his wind to that degree of perfection that is attainable by art.

It is firſt neceſſary to take an exact view of his body, whether he be low or high in fleſh; and it is alſo neceſſary to conſider whether he be dull and heavy, or briſk and when abroad. If he appear dull and heavy, and there to ſuppoſe it is owing to too hard riding; or, as s expreſs it, to ſome greaſe that has been diſſolved in hunting, and has not been removed by ſcouring, then the proper remedy is half an ounce of diapente, given in a pint of good ſack; this will at once remove the cauſe, and revive the creature's ſpirits. After this, for the firſt week of the month, he is to be fed with oats, bread, and ſplit beans, giving him ſometimes the one, and ſometimes the other, as he likes beſt; and always leaving ſome in the locker, that he may feed at leiſure when he is left alone. When the groom returns at the feeding time, whatever is left of this muſt be removed, and freſh given; by this means the creature will ſoon become high ſpirited, wanton, and full of play. Every day he muſt be rode out an airing, and every day it will be proper to give him a little more exerciſe; but not in ſuch a degree as to make him ſweat too much.

The beans and oats in this caſe are to be put into a bag, and beaten till the hulls are all off, and then winnowed clean; and the bread, inſtead of being chipped in the common way, is to have the cruſt clean cut off.

If the horſe be in good fleſh and ſpirits when taken up for its month's preparation, the diapente muſt be omitted; and the chief buſineſs will be to give him good food, and ſo much exerciſe as will keep him in wind, without overſweating or tiring his ſpirits. When he takes larger exerciſe afterwards, towards the end of the month, it will be proper to have ſome horſes in the place to run againſt him. This will put him upon his mettle, and the beating them will give him ſpirits.

This, however, is to be cautiouſly obſerved, that he has not a bloody heat given him for ten days or a fortnight before the plate is to be run for; and that the laſt heat that is given him the day before the race, muſt be in his clothes: this will make him run with greatly more vigour when ſtripped for the race, and feeling the cold wind on every part. In the ſecond week, the horſe ſhould have the ſame food and more exerciſe: and in the laſt fortnight he muſt have dried oats, that have been hulled by beating; after this they are to be wetted in a quantity of whites of eggs, beaten up, and then laid out in the ſun to dry; and when as dry as before, the horſe is to have them. This ſort of food is very light of digeſtion, and very good for the creature's wind. The beans in this time ſhould be given more ſparingly, and the bread ſhould be made of three parts wheat, and one part beans. If he ſhould become coſtive under this courſe, he muſt then have ſome ale and whites of eggs beaten together: this will cool him, and keep his body moiſt.

In the laſt week the maſh is to be omitted, and barley-water given him in its place; and every day, till the day before the race, he ſhould have his fill of hay; then he muſt have it given him more ſparingly, that he may have time to digeſt it; and in the morning of the race day, he muſt have a toaſt or two of white bread, ſoaked in ſack, and the ſame juſt before he is led out of the field. This is an excellent method, becauſe the two extremes of fullneſs and faſting are at this time to be equally avoided; the one hurting his wind, and the other occaſioning a faintneſs that may make him looſe. After he has had his food, the litter is to be ſhook up, and the ſtable kept quiet, that he may be diſturbed by nothing till he is taken out to run. See Racing.

Plates, in *Gunnery*. The *priſe*-plates, are two plates of iron on the cheeks of a gun-carriage, from the cap-ſquare to the centre, through which the priſe-bolts go, and on which the hand-ſpike reſts, when it poiſes up to the breech of the piece. *Breaſt*-plates are the two plates on the face of the carriage, one on each cheek. *Train*-plates are the two plates on the cheeks at the train of the carriage. *Dulidge*-plates are the fixed plates on the wheel of a gun-carriage, where

where the fellows are joined together, and serve to strengthen the dulidges.

Plates, *Copper*, in *Engraving*. See Copper-*Plates*.

Plates, *Ground*, in *Building*. See Ground-*Plates*.

Plates, *Pintle*. See Pintle.

Plate-*Glass*. See Glass.

Plates, *Colours of Glass*. See Colours.

Plate-*Knees*, in *Ship Building*, are iron knees, made of flat bars of iron, about one inch thick, and four inches broad; the arms are bolted through the end of the beam, and a chock of oak under the beam, which is first bolted through the ship's side. This method of connecting the beams to the side is an excellent substitute for wood hanging-knees.

Plate-*Longe*, in the *Manege*, a woven strap, four fathoms long, three fingers broad, and as thick as one. It is used for raising a horse's legs, and sometimes for taking him down, in order to facilitate several operations of the farrier. Some improperly give the name of plate-longe to the martingale.

PLATEA, in *Ornithology*, the name of a bird of the long-necked kind, approaching to the nature of the stork and heron, and called in English the spoon-bill. See Platalea.

PLATED Manufacture, in the *Arts*. From the valuable properties possessed by silver as a metal, it is much to be regretted that it is not sufficiently plentiful, so as to be used for the fabrication of such articles as are liable to corrosion; more especially such utensils as are employed for culinary purposes. This desirable object has given rise to the desideratum of covering some of the cheaper metals with silver, and this art has always been known by the name of plating.

The art of plating with silver appears to have been first applied to articles made of brass, after they were in other respects finished. It is known by the name of French plating, and was formerly much used for brass candlesticks. After the goods were polished, and perfectly free from grease, and indeed any other extraneous matter, the part to be plated was heated to a temperature something short of changing the colour of the metal. Leaf silver was now laid upon the part, and, while hot, was rubbed on with a hardened steel burnisher, perfectly dry and clean. By this means the silver adhered firmly to the brass, which, from the action of the burnisher, assumed a fine polish. These had much the appearance in colour and lustre of those of the present day. They possessed but little permanence, owing to the thinness of the covering. This art is scarcely now practised, from the introduction of the superior plan of plating upon ingots of copper, and forming the utensils out of the sheets and wire made from the ingots. This latter is at present carried on to an immense extent in Sheffield, and also at Birmingham, but on a lesser scale.

The inventor of this method of making plated articles was not aware of its great importance. He began by making it into snuff-boxes, and other trifling articles. It afterwards was extended to the manufactory of pints and tankards, and other articles, by a Mr. Hancock, who erected a mill near Sheffield for rolling the ingots. This mill is at present employed for this purpose by the son of the above gentleman.

The plated manufacture is divided into three departments, in each of which a distinct set of workmen is employed.

Those workmen employed in making vessels, such as are required to be raised by the hammer, are called braziers, probably from braziers being first employed in it.

The next are called candlestick-makers, being exclusively employed in making all the varieties of these articles.

The next and last are called pierce-workers: these were originally employed in making articles with ornamental open work, such as bread-baskets, and trays of different kinds.

This open work was formed by piercing the substance with punches of different shapes, by means of a screw-press called a fly.

This species of work is now become obsolete, since the invention of plated wire. The articles in which pierce-work had been made, are now formed by the varied intersections of wires, which give great lightness and elegance, with less waste and more expedition. The workmen employed in this department are still called pierce-workers.

Previously to describing particularly the different branches of this art, we shall give the method of preparing the plated sheets and wire of which all the different articles are made.

The ingots on which the silver is laid are not pure copper, but an alloy, consisting of copper and brass; this gives it a degree of stiffness greater than that of copper, which renders it less liable to be deformed when in use.

Fig. 12. in *Pl. Plated Manufacture*, represents a section of the furnace used for melting the alloy for the purpose of casting. The crucibles are those made at Chelsea with black-lead. The ingot-moulds are of cast-iron, consisting of two pieces, fastened together by two rings, with wedges, the interior being of the shape of a parallelepipedon, about three inches broad, $1\frac{1}{2}$ in thickness, and about eighteen or twenty long. The mouth-piece, into which the metal is poured, makes an angle with the length of the cavity; so that when the mould is placed on the ground, with the narrow side uppermost, and makes an angle with the horizon of about ten degrees, the mouth-piece points directly upwards. The inclination of the mould and the length of the mouth-piece are to give a certain head of liquid metal, which determines the impurities of less specific gravity than the metal to rise into the cavity of the mouth-piece, in order to insure the soundness of the ingot. If this were not attended to, the sheets rolled from such ingots would abound with seams and loose places. It is easy to see that a small hole in the ingot would be the source of a seam by extension, and a larger cavity would have the effect of making hollow places in the substance of the sheet, which frequently peel off with the silver after plating.

The proper heat of the metals, and the temperature of the mould when the metal is poured, are of great importance, as far as regards the soundness of the ingot. When the metal is too cold, and its liquidity of course imperfect, the impurities cannot freely ascend, which causes imperfection in its substance. The same effect may take place from the moulds being cold: this, with the great conducting power of the metal mould, rapidly robs the metal of its caloric, and lessens its liquidity. The proper heat for the moulds is something short of burning the fat with which they are greased on the interior surface. The presence of fat which contains hydrogen has a happy effect in preventing the surface being rough. Its presence is therefore essential, and hence the moulds should never be so hot as to destroy it. On the other hand, the metal should not be too hot, as in this case it remains longer in the liquid state than is proper: this has the effect of allowing the metal to assume a more complete crystalline arrangement than under ordinary circumstances. When an ingot under such circumstances is broken, the crystals are very distinct. The sheet rolled from an ingot so cast, will be found to exhibit on its surface very thin loose pieces, which peel off. This is frequently a source of great mischief to the manufacturer. After the pieces are plated and

and rolled, this laſt inconvenience is frequently ſo great, as to render the whole ſheet uſeleſs, except to work over again.

It will be remembered, from what we obſerved reſpecting the temperature of the ingot moulds, that the proper heat for the metal can only be acquired by practice. Men of ſome talent and obſervation ſhould have the management of caſting and plating. It is notorious, however, throughout the trade, that the men employed in this eſſential department are generally taken from the claſs of common labourers.

The beſt teſt for the proper degree of heat of the metal is its colour, and the appearance of liquidity. When it firſt fuſes it appears ſtiff, and of the colour of the red cokes of the furnace: with a greater heat it becomes more liquid, and aſſumes a blueiſh colour. This latter is the proper ſtate for pouring it into the mould. If the heat be greater, the zinc of the braſs, and perhaps the copper itſelf, begins to burn. This ariſes from the metal's aſſuming the form of vapour, which combines with the oxygen of the atmoſphere. When the metal has become ſolid in the mould, the wedges which keep the two halves of the mould together are ſlackened, to prevent the ingot from breaking, by its contraction, during cooling. When it is taken from the mould its ſurface ought to be ſmooth and metallic. Its fracture ſhould exhibit a rough uniform cryſtallization, in which the cryſtals preſent ſmall ſurfaces. If the cryſtals appear diſtinct, with large faces, the metal will be ſhelly when rolled.

For the ordinary kind of work theſe ingots are generally cut in two in the middle, being more convenient for plating than longer pieces.

The next proceſs is to dreſs the face of the ingot for the purpoſe of receiving the ſilver, on one or both ſides, as it may be intended to be ſingle or double plated. This is effected by filing, which is continued till the ſurface becomes entirely free from the leaſt blemiſh. This is ſo important, that the naked eye ſhould not be depended upon. A very ſmall hole in the ingot would become a ſurface on rolling, and the ſilver would come off in that part. The ſurface of the copper ſhould, therefore, be minutely examined by a magnifier before the ſilver is laid on. The thickneſs of the ſilver to be laid on the copper will be beſt known, when it is underſtood, that the ſilver, in ſingle plated metal, or that plated on one ſide only, is from 8 to 10 pennyweights to the pound troy of copper; and, of courſe, double that quantity when plated on both ſides. If the ingot of copper be $1\frac{1}{4}$ thick, the ſilver plate to be laid upon it, at eight pennyweights to the pound, will be $\frac{1}{31}$ of an inch, and a ſquare inch of it will weigh about 90 grains. When the plate of ſilver is cut to a little leſs than the ſize of the copper ſurface, made flat, and ſcraped perfectly clean, the copper ſurface being equally clean, they are laid together, and the ſilver plate is tied down with wire. A little of a ſaturated ſolution of borax is now inſinuated under the edge of the ſilver plate on every ſide: this fuſes at a low red heat, and prevents the oxygen of the atmoſphere from affecting the ſurface of the copper, which would prevent the adherence of the ſilver. In this ſtate the ingot is brought to the plating furnace.

In *fig.* 12. B is an iron door, with a ſmall hole to look through. This furnace has a grate on a level with the bottom of the door. The fuel conſiſts of cokes. The ingot is laid upon the bare cokes, and the door ſhut. When it has acquired nearly a proper degree of heat, the plater applies to the hole in the door to obſerve the proper point, when the proceſs is finiſhed. When the ſilver and copper are uniting, the ſurface of the former begins to be rivetted, and this is the ſign to remove the ingot from the fire as quick as poſſible. If it were allowed to ſtop longer, the ſilver would become alloyed with the copper, and completely ſpoiled.

In this proceſs, the ſilver is, in fact, ſoldered to the copper, although no ſolder is expreſsly employed. It is well known to chemiſts, that an alloy of ſilver and copper, as well as many other alloys, is more fuſible than either of the ſimple metals. From what takes place in the above proceſs, it will be eaſily inferred, that a portion of ſilver and copper unite at contiguous ſurfaces, which fuſing before the ſilver or the copper, unite the ſilver with the copper. The ingot, being now plated, is made perfectly clean, and is ready to be rolled. The firſt rollers employed for plated metal are of caſt-iron, ſimilar in ſize and conſtruction to thoſe employed for ſheet iron and ſheet copper. (See Rolling Mill.) The metal is rolled cold, and annealed from time to time. When it has gone through the rollers a certain number of times, it acquires a certain degree of hardneſs, ſo that the rollers have not much effect upon it; and if the rolling were continued, the metal would crack. To remedy this evil, the metal is taken to a reverberatory furnace. It is laid upon a hearth of brick or fire-ſtone, and the flame of coal made to paſs over it. The heat, however, is not intenſe, ſince the metal is required to be ſlowly heated to a dull red. It may now be cooled in the quickeſt way poſſible to ſave time, as quenching in water does not affect it, as is the caſe with ſteel. It now paſſes through the rollers, as before, till it becomes hard, and then annealed and rolled again, till it is reduced ſomething ſhort of the ſize required. This being done, it is again annealed and paſſed through a pair of rollers faced with caſt ſteel, and finely poliſhed. This gives the ſurface great ſmoothneſs and truth. It is now annealed for the laſt time: after this, the ſheets are immerſed in hot dilute ſulphuric acid, then ſcowered with fine Calais ſand, which fits them for the workmen to ſhape into different articles.

Having deſcribed the method of preparing the ſheet plated metal, we ſhall next give an account of the method employed for manufacturing plated wire. This is generally a diſtinct buſineſs, being unconnected with the buſineſs of making the plated goods.

The pieces of metal to be plated for the purpoſe of making wire, are forged out of bar copper unalloyed. Theſe pieces are of a cylindrical ſhape, and about 18 or 20 inches long, and about $1\frac{1}{2}$ inch in diameter. The true cylindrical ſhape is given to the copper by wire-drawing: it is then made perfectly clean and metallic by ſcraping. The ſilver to be laid upon it is much thinner in proportion to the copper than was ſtated in the ſheet metal. The ſilver is firſt formed into a tube, one edge projecting a little over the other. A copper cylinder, a little leſs in diameter than the tube, and ſo much longer as to admit one end of it being faſtened into a hole, is now heated red-hot, and faſtened by one end in the hole. The tube is now ſlipped upon it, with the ſeam upwards. A flat ſteel burniſher, with rounded poliſhed edges, and a handle at each end, is now rubbed briſkly backward and forward upon the overlapped edges of ſilver, at the ſame time uſing conſiderable preſſure. By this means the two ſurfaces are completely welded together, ſo that it would be difficult to find where the union had taken place.

The cylinder of copper intended to be plated, is now made perfectly clean, the inſide of the ſilver tube being the ſame. It is now put upon the cylinder, which is about

two

two inches longer than the tube; a ſmall groove is made round the cylinder coinciding with the ends of the ſilver tube. Into this groove the ends of the tube are cloſely worked, ſo as to render the ſpace between the tube and the cylinder perfectly air-tight. The neceſſity of this will be obvious, ſince the whole is required to be heated red-hot, which would cauſe the oxydation of the copper, and prevent the ſilver from adhering to it. When the cylinder and tube are together heated ſlightly red-hot, the ſame burniſher that was uſed to unite the tube is now rubbed briſkly over the tube in a longitudinal direction. This unites the ſilver firmly to the copper, and makes it fit for drawing into wire of various forms and ſizes. The machinery employed for drawing this wire is preciſely ſimilar to that employed for braſs and copper wire. The great variety of figure and form given to it depends upon the plate through which it is drawn. Some are flat, others half round, ſome fluted, or with mouldings. It is chiefly uſed for making bread-baſkets, toaſt-racks, ſnuffers, and many other articles, affording much neatneſs and elegance, with little manual labour. The wire after drawing, like ſheets after rolling, is annealed, and afterwards cleaned with hot dilute ſulphuric acid.

We ſhall firſt deſcribe the manufacture of ſheet metal into various articles. It may be eaſily conceived, that the nature of this metal is ſo ſimilar to copper, that the working of it with the hammer into various forms will be very ſimilar to that uſed by copperſmiths, with the difference of more exact and complete tools, and greater care on account of the value of the metal. Formerly all the different ſhaped veſſels were made with the hammer, which made the price of labour very great. Now, all veſſels of ſimple form, and not of large ſize, are formed in dies by means of the ſtamping hammer. This operation is now ſo general, that ſome manufacturers employ as many as ſix or eight of theſe engines.

Figs. 1 and 2 are two views of the ſtamp. A is a large ſtone, the larger the better; *b*, the anvil on which the die, *e*, is ſecured by four ſcrews. See ground plan.

In *fig.* 1. *a*, *a*, are two upright ſquare pillars, with the angles oppoſed to each other, which work in angular receſſes in the hammer *d*. This admits the hammer to ſlide freely and truly from top to bottom, by pulling at the rope *f*, which paſſes over the pulley *c*. This hammer is let fall from different heights, according to the effect to be produced.

All veſſels may be raiſed by the ſtamp, with the exception of ſuch as are immoderately large, or thoſe of inordinate depth, compared with the diameter. Veſſels which are of leſs diameter at the top and bottom than in the middle, muſt either be ſtamped on two pieces, or raiſed with the hammer by hand.

The dies are, or ought to be, made of caſt ſteel, but it ſhould be as hard as to weld to iron, ſo that the iron ſhould not be much below the ſurface of the die. This precaution is neceſſary only when the die requires to be hardened. In other reſpects the whole may be caſt ſteel. Thoſe unhardened ſhould be of harder caſt ſteel. No other ſteel can anſwer, as it would be liable to abound with flaws, and would not be uniformly hard.

When the die is placed upon the anvil, and the metal cut into pieces of proper ſize, the next thing is to ſurround the top of the die with a paſte made with oil and clay, an inch or two above the ſurface. This cavity is now filled with melted lead. The under ſide of the ſtamping hammer has a flat face of iron fitted into it, about the breadth and length of the die: this is called the *lickerup*. When the lead becomes ſolid, the hammer is raiſed to a certain height and let fall upon it. The underſide of the *lickerup*, from being cut on the ſurface into teeth in ſhape like thoſe of a raſp, firmly adheres to the lead, which afterwards riſes with the hammer. The metal is now placed over the die, and the hammer with its lead made to fall upon it, till the impreſſion on the metal is complete. If the veſſel to be ſtamped be of any conſiderable depth, two or three dies are often uſed, one bigger than another, the laſt being of the proper ſize and ſhape. It ſometimes happens, that when the veſſel has a long conical neck, they are obliged to have recourſe to an auxiliary operation called drafting. Theſe in the plate are called emboſſing punches.

In *fig.* 11. the punches are made of caſt ſteel, and the cavities turned out in a lathe. The pieces *a*, *b*, are of lead. This operation is performed by a ſeries of theſe punches of different ſizes, beginning with the largeſt firſt, and gradually going on to the ſmalleſt. By this means a hollow cone may be raiſed out of a flat plate, three or four inches in length, and not more than an inch in diameter at the wideſt part. Theſe punches are alſo employed for ſmall articles of too great delicacy for the ſtamp.

It frequently happens, that one part of an article is made by the ſtamp, and the reſt by the hammer. Sometimes they are rudely formed by the hammer and finiſhed by the die.

Cylindrical and conical veſſels are moſtly formed by bending and ſoldering. The bending is performed on blocks of wood with wooden hammers, to avoid injuring the plated ſurface. We ſhall here recommend a method of turning rings, or any thing in a cylindrical or conical ſhape. It is already uſed to great advantage by tin-plate workers. This is done by a machine conſiſting of three rollers, a ſection of which is ſhewn in *figs.* 5 and 6. A, B, C, are the three rollers, and *a b c d* the piece of metal paſſed through them to receive the cylindrical or conical ſhape.

The upper roller, A, can be raiſed or lowered at pleaſure, which has the effect of determining the diameter of the cylinder. When one end of the upper roller is higher than the other, it gives the conical ſhape. In order to ſolder the cylinder or cone, the two edges are made very true, and are kept in contact by binding with ſmall iron wire. The part where the ſolder is intended to be run muſt be made perfectly clean by ſcraping. The ſolder employed is that called ſilver ſolder. It is an alloy of braſs and ſilver, or rather an alloy of ſilver, zinc, and copper. The alloy of copper and ſilver is more fuſible than either of theſe metals, and may be employed as a ſolder for ſilver, copper, or plated metal, when the plated metal has no zinc in its compoſition. It is, however, neceſſary to employ an alloy of braſs and ſilver as a ſolder for plated metal. The braſs ſhould be the leaſt poſſible, being no more than what is neceſſary to give the requiſite fuſibility to the ſolder, ſince too much braſs would not only injure the colour, but its malleability is impaired, and the ſeam would break when it came to be hammered.

The ſolder is firſt caſt into an ingot, and then rolled thin enough to cut with ſhears into ſmall ſhreds. Beſides the ſolder they alſo employ borax, and a ſubſtance which floats on the top of melted glaſs, and is taken off as refuſe. It is called *ſandiver*, and probably conſiſts of ſulphat of potaſh and flint. The borax is firſt calcined, which conſiſts in driving off the water of cryſtallization. The white powder is then mixed with a little water, a ſmall quantity of the powdered *ſandiver* being at the ſame time added. After the ſeam to be ſoldered has been ſmeared with this pulpy maſs, and the bits of ſolder laid on, the whole is expoſed to the heat of a lamp with a blowpipe; or if the ſubſtance be large, to a charcoal fire, urged with bellows. The borax firſt fuſes,

fuſes, and defends the parts to be united from the action of the air. The heat is then increaſed rapidly till the folder melts. The uſe of the ſandiver is to prevent the iron wire from being ſoldered to the other metal. It appears that the ſalt in this ſubſtance is decompoſed by the iron, by which the ſurface of the lathe becomes oxydated, and prevented from uniting with the ſilver or the copper. The ſandiver has no action upon the other metals, and therefore does not prevent their union. When the united part is made clean, and hammered with poliſhed tools, the ſeam cannot be ſeen on the ſilvered ſide. If a yellow line appear, the ſolder contains too much braſs.

Veſſels intended to have other forms are generally ſoldered up in a conical or a cylindrical form, according as the width at the top and bottom of the veſſel varies. The metal is ſo malleable, even in the ſoldered part, that a ſkilful workman can give almoſt any form to a veſſel with the hammer.

Mouldings are ſometimes formed upon the edges of veſſels, which ſerve to give much ſtrength and ſtiffneſs, as well as being ornamental. This operation is performed by an inſtrument called a ſwage, ſee *figs.* 3 and 4. The part A lifts up by a joint, and the metal to be ſwaged is placed between the dies, as ſhewn in the figures: the part *b* is held in a vice, while the other reſts upon it. By ſtriking on the part A, at the ſame time ſhifting the metal forward, the bead is formed. In *fig.* 3, the part *a* is a guide to regulate the diſtance of the bead from the edge. The ſame effect is produced in a neater and more expeditious manner by the rollers, *figs.* 8, 9. *Fig.* 10. is a ſection, ſhewing the form of the bead. The two wheels *a*, *a*, (*fig.* 8.) are placed upon an axis, which have pinions for the purpoſe, the lower one giving motion to the upper one. The groove in the upper wheel correſponds with the bead in the lower one, and the metal paſſed between aſſumes the ſame figure. This machine, a little varied, may be uſed as ſhears to cut the metal into pieces of uniform breadth. A part of the upper wheel *a*, for this purpoſe muſt be a little larger, and the edges ſquare and ſharp. The lower wheel being put on firſt, the other muſt be put on to the other axis, till the face of the enlarged part comes up to that of the other wheel, and in this ſituation ſecured by nuts. It will be evident, that if a piece of metal be now placed between them, that the metal will be cut by the projecting part of the upper wheel, in a ſimilar manner to that employed for ſlitting iron.

The beading and moulding, however, is not at preſent much uſed. When prominent parts like theſe are merely plated metal, they, from being more expoſed, ſoon become bare, and the copper ſurface is preſented.

The greateſt improvement ever made in this branch of manufacture, is the introduction of ſilver edges, beads, and mouldings. Without this means of defending the prominent parts which become ſo ſoon bare in the old method, the trade muſt long ſince have gone into diſgrace, and ultimately to decay. The ſilver intended to form the prominent and ornamental parts is rolled extremely thin, a ſuperficial inch ſometimes not weighing more than 10 or 12 grains.

This is too delicate to have the ornamental form given to it by the ſwage above deſcribed. The two oppoſite dies being ſteel, if not very accurately made, would tear ſilver ſo delicate as that uſed for ornaments. It is neceſſary, therefore, that the ſunk part of the die ſhould be ſteel, and the oppoſite ſide lead, as was obſerved in the ſtamping, and this is the method generally employed to form theſe ſilver ornaments. It ſeems wonderful, that manufacturers have not thought of doing this by ſmall rollers. It would only require to have the part in which the die is ſunk a wire ring of caſt ſteel, the concave part being a little conical, and made to exactly correſpond with a convex cone on one of a pair of rollers, ſo that by a little force it may be as firm as a ſolid roller. A ring of lead, or even a ſtraight piece, might act oppoſite to the die. A much greater variety of dies might be made in this way, than by making dies flat. The dies would coſt leſs, and be better executed. The ſilver would alſo run leſs riſk of tearing, than by the ſtamp or the ſwage.

When theſe ſilver mouldings are formed, and the refuſe metal poured off, they are laid upon a level plate, with the hollow ſide upwards. Small bits of reſin are put into the hollow parts, and ſoft ſolder melted in with a ſoldering iron, the point of the ſame being applied into the groove to keep it in a ſtate of fuſion. This is continued till the cavity is quite full. To prevent the ſolder from accidentally adhering to the convex part, it is previouſly covered with a paint-like compound of ſize and whitening. The ſame expedient is reſorted to in all caſes where ſoft ſolder is employed, or when it is applied to great heat. The ſoft ſolder is formed of equal parts of lead and tin. The former metal has ſo great an affinity for lead, as to require the greateſt care to keep theſe metals ſeparate when one of them is in a ſtate of fuſion.

The ſilver ſhells, thus filled with ſoft ſolder, will now admit of being bent into almoſt any form. After they are fitted accurately to the place they are to occupy, the part being firſt made clean and partially tinned, they only require to be ſecured by temporary faſtenings, till the parts can be expoſed to a degree of heat capable of melting the ſolder. This unites the ornament, without leaving any appearance of ſolder on the outſide.

In forming ſubſtances which have a maſſive appearance, ſuch as the feet of tea urns, the handles of veſſels, and plated table ſpoons, no other metal is employed but the ſheet. The maſs is formed of two ſhells, which, when put together, form an apparent ſolid. Each of the concave parts is firſt filled with ſoft ſolder, they are then fitted accurately together, and heat applied till the maſs fuſes, ſo that the apparently maſſive article conſiſts of a ſhell of plated metal filled with ſoft ſolder. Bulky ornaments, in the form of ſhells and flowers, are frequently put on in this way; ſome in ſilver. Theſe have a ſimilar maſſive appearance to, and ſtrongly imitate, real plate.

All goods formed by hand with the hammer, require great labour in finiſhing. After hammering the veſſel into the proper ſhape, the marks of the hammer appear like ſo many flat places. Theſe are removed from the outſide of the veſſel to the inſide, when the inſide is concealed, as in tea urns. This is effected by covering either the anvil or the hammer with a piece of the ſtuff called everlaſting. The roughneſs is transferred to that ſurface in contact with the everlaſting. In hammering plated metal from time to time, it requires to be annealed by heating it red-hot: this diſcolours both the ſilver and the copper. Theſe are cleaned by boiling in dilute ſulphuric acid, and ſcowering with Calais ſand. The ſulphuric acid to the water is in very ſmall proportion. If the ſilver begins to appear black by boiling, the acid is too much, and muſt be watered. When the veſſels are finiſhed in every reſpect by the maker, and the ſurface free from oxyd, it frequently happens that bits of roſin, uſed with ſoft ſolder, adhere to it. This is removed by boiling in a weak ſolution of pearl aſhes. The ſame is alſo uſed for cleaning the ſurface of tinned copper.

The veſſels are now ready for burniſhing, a proceſs which we ſhall ſoon deſcribe.

Our

Our inſtructions hitherto have particularly applied to braziers' work; we ſhall next deſcribe the candleſtick-making.

In this branch of the buſineſs there is great variety. In the commencement of this trade the object was chiefly to imitate thoſe made of ſilver, and it began with the prevailing taſte of imitating the different orders of architecture. The numerous points and prominences thus introduced, were ill fitted for plated metal, as in a very little time their ſilver diſappeared, which gave them the moſt ſhabby appearance poſſible. This obliged the manufacturers to make them more plain and ſimple, and it was not till the diſcovery of the ſilver edges, that candleſticks of plated metal began to gain reſpect in the world of luxury and faſhion. The ſtems of candleſticks have been made ſquare; ſome with ſharp, others with rounded corners; others oval, but the greateſt number with round ſtems, which appear to be the moſt conſiſtent and the moſt permanent. Of theſe, the patent teleſcope candleſtick has had the greateſt run. This conſiſts in the cylindrical part lengthening and ſhortening at pleaſure, by one tube ſliding into the other. In this caſe the tubes are drawn by machinery, ſimilar to that uſed for drawing the tubes of teleſcopes. The feet of candleſticks, or the baſe, are generally made in a die by the ſtamp. The neck, which is ſometimes ſmall in one part, is alſo ſtamped. The diſh part of the nozzle or ſocket is made in a die, and the tube part in the ſame way as the cylindrical pillar. Theſe, for the ſake of neatneſs and expedition, are generally drawn in the wire drawing machine, whether for ſliding or not. Some of theſe tubes are fluted. The prominent moulding and beads are generally of ſilver. The different parts are ſoldered together, ſome parts with hard and others with ſoft ſolder. The branches of candleſticks are formed in two halves, like the tea urn feet, &c. In forming ſuch articles as are made of wire, ſuch as bread baſkets, toaſt racks, and caſters, the wire is bent into the given form with a wooden block and a mallet. When pieces require to be ſoldered together, the joinings muſt be accurately fitted, in order to prevent the copper from appearing. In theſe caſes hard ſolder is employed. This branch of plated manufacture admits of extenſive application. Wires are capable of great variety of poſitions. The work lately publiſhed by ſir James Hall, ſeems to prove that Gothic architecture has originated in the fanciful forms of bended twigs. The peruſal of this work could not fail to give important hints to an ingenious manufacturer of plated wire work.

Plated goods, particularly tea urns, and globular veſſels for the ſame purpoſe, frequently require to be engraved; but it is obvious that, from the extreme thinneſs of the plate, the graver would lay bare the copper; and if the plate was ſo thick all over as to admit of engraving, the articles would be very expenſive. Both theſe evils are obviated, by working an extra plate of ſilver on to the part to be engraved. This is done while the plate, of which the veſſel is made, is in its flat form. The part where the engraving will fall is firſt ſcraped clean, and a plate of ſilver, of ſimilar thickneſs to that employed for ſilver edges, is cut to the ſame ſize, and alſo ſcraped clean. The plated ſheet is then laid upon a hot anvil, and the plate of ſilver laid upon the place prepared. It is firſt rubbed ſlowly, but with great preſſure, with a poliſhed hammer previouſly heated, but not ſo as to affect the poliſh. The plate will begin to adhere, and it may then be ſlightly hammered; ultimately it will adhere all over, and may now be hammered on a poliſhed ſtake, till the whole ſurface becomes plane, and the piece of ſilver cannot be diſtinguiſhed from the reſt. This proceſs is on the ſame principle as the plating of wire, and is ſimilar to welding two pieces of iron together. It appears practicable that the ſurfaces of any malleable metals, when clean and heated to acquire a certain degree of ſoftneſs, are capable of uniting. Moſt people are familiar with the union of two pieces of lead by preſſure, even at the common temperature.

When the different plated goods come out of the hands of the workmen, the metal, although clean, is of a dull white colour, poſſeſſing no poliſh whatever.

This laſt finiſh is called burniſhing, and is generally performed by females in a diſtinct ſet of apartments. The burniſhing tools are generally made of blood-ſtone, and ſome of hardened ſteel finely poliſhed. The latter are to burniſh the minute parts which cannot be touched by the blood-ſtone, which are employed chiefly for the greater and uninterrupted parts.

The bits of blood-ſtone are let into little caſes, made of ſheet iron, and then finely poliſhed.

The burniſhers, if uſed dry, would adhere to the ſilver in ſome places, and would ſcratch inſtead of giving the fine poliſh intended. This is obviated by frequently dipping the burniſhing tool into a ſolution of white ſoap. After being burniſhed they are raiſed, and laſtly wiped with clean ſheep's leather.

It is a circumſtance much to be regretted, that ſilver, although it is ſuſceptible of ſo fine a poliſh, does not keep its luſtre. This is occaſioned by the ſulphur which comes from ſulphurated hydrogen, a gas always exiſting in the atmoſphere. The thinneſt coating of any ſubſtance will prevent this change. If the ſurface of ſilver were coated with a ſolution of gum arabic or iſinglaſs, the defence will not be perceived, and the ſilver will never change colour.

We ſhall conclude this article with a few remarks upon the preſent mode of plating the ingots intended for ſheets. It will be evident, that ſince the heat in plating muſt be equal to forming a portion of an alloy of ſilver and copper, which by its early fuſion unites the two ſurfaces together, the ſilver will not be uniform in its quality, and by wearing will preſent an alloy having more than its proper quantity of copper; and will, in conſequence, exhibit a baſe colour. It will be remembered, that the method uſed for plating the wire ingots does not admit of this inconvenience. The ſilver will keep its colour to the laſt. We ſhall no doubt hear, at ſome period when the plated manufacturers employ men of talent as platers, that the ingots for rolling will be plated by the method employed for the wire.

PLATER, Felix, in *Biography*, an eminent phyſician of the 16th century, was born at Baſle in 1536, of the college of which place his father was principal. Here Felix received his early education under his father's eye; and afterwards went to complete his medical ſtudies at Montpellier, where he diſtinguiſhed himſelf at an early age, and obtained the degree of doctor in 1556. He then returned to Baſle, where he is ſaid to have taken another degree in the following year, and ſettled in the practice of his profeſſion. His reputation and ſucceſs were ſoon equal to the promiſe of his education; for he was appointed to the chair of medicine in 1560, and became the confidential phyſician of the princes and nobles of the Upper Rhine. In addition to his medical ſkill, he poſſeſſed an extenſive knowledge of anatomy, botany, natural hiſtory, and other branches of ſcience, and contributed much by his talents and character to the celebrity of his native univerſity, in which he was a teacher upwards of fifty years. He died in July, 1614, in the 78th year of his age, extremely regretted by his countrymen and his brother-profeſſors. He left the following works: "De Corporis humani ſtructura et uſu Libri tres," Baſle, 1583 and 1603, folio; "De

Febribus Liber," Francfort, 1597; "Praxeos Medicæ Tomi tres," Baſle, 1602; "Obſervationum Medicinalium Libri tres," ibid. 1614, &c.; "Conſilia Medica," Franef. 1615, in the collection of Brendelius; "De Gangrænâ Epiſtola," in the firſt century of the letters of Hildanus. After his death were publiſhed "Quæſtionum Medicarum paradoxarum et eudoxarum Centuria poſthuma," Baſle, 1625, edited by his brother, Thomas Plater; and "Quæſtiones Phyſiologicæ de partium in utero conformatione," Leyden, 1650.

Thomas Plater, the brother of Felix, alſo was a profeſſor of medicine at Baſle, and had two ſons, Felix and Francis, the former of whom occupied ſucceſſively the chairs of logic and natural philoſophy. Eloy Dict. Hiſt. de la Medecine.

PLATERNETZA, in *Geography*, a town of Sclavonia, on the Save; 10 miles from Poſzega.

PLATES, a cluſter of ſmall iſlands among the Bahamas. N. lat. 22° 30′.

PLATESSA, in *Ichthyology*, a name by which Auſonius and ſome other authors have called the paſſer-fiſh, or common plaiſe. See Pleuronectes *Plateſſa*.

PLAT-FOND, in *Architecture*, the ſame as ſoffit.

PLAT-FORM, in the *Military Art*, an elevation of earth, a floor of wood or ſtone, on which cannon is placed to fire on the enemy.

Such are the mounts in the middle of the curtains. On the rampart there is always a platform, where the cannon are mounted.

It is made by the heaping up of earth on the rampart, or by an arrangement of madriers, riſing inſenſibly for the cannon to roll on, either in a caſemate, or an attack in the outworks.

Plat-forms are generally laid ſloping towards the parapet, nine or ten inches; this declivity carries off the rain, prevents the gun from recoiling ſo much when fired as it would do if laid level; and, when loaded, it is more eaſily brought to the embraſure.

In temporary batteries, the plat-forms are made of planks laid acroſs ground-timbers or ſleepers, uſually five in number, and kept ſteady by ſtakes at each end; there is uſually a plat-form made to each gun; it is commonly about eighteen feet long, eight feet broad next the parapet, and about fourteen feet broad at the tail, the intermediate ſpaces between the plat-forms ſerving for the ſhot and other neceſſaries. When a plat-form is to be laid on marſhy ground, firſt lay a floor or two of faſcines; cover theſe with hurdles, twelve or fifteen feet long, and ſix or ſeven broad; on theſe lay a floor of three or four inches of earth, and therein lay the ſleepers, and over them the planks. When a battery is built of ſtone or brick, the plat-form is generally a flat ſtone pavement ranging the whole length of the battery: this, on account of its reſiſting the injuries of the weather for a long time, is to be preferred to planks; but in caſe of bombardment ſuch a plat-form is to be avoided, becauſe the ſhells will not only break the pavement, but alſo, by driving about the broken ſtones, do much miſchief to the troops.

All practitioners are agreed, that no ſhot can be depended on, unleſs the piece be placed on a ſolid plat-form; for if the plat-form ſhakes with the firſt impulſe of the powder, it is impoſſible but the piece muſt likewiſe ſhake; which will alter its direction, and render its ſhot uncertain. To prevent this accident, the plat-form is uſually made extremely firm to a conſiderable depth backwards, ſo that the piece is not only well ſupported in the beginning of its motion, but likewiſe through a great part of its recoil. However, it is ſufficiently obvious, that when the bullet is ſeparated from the piece, it can be no longer affected by the trembling of the piece or plat-form; and by a very eaſy computation it will be found, that in a piece ten feet in length, carrying a bullet of twenty-four pounds, and charged with ſixteen pounds of powder, the bullet will be out of the piece before it has recoiled half an inch; whence, if the plat-form be ſufficiently ſolid at the beginning of the recoil, the remaining part of it may be much ſlighter, ſince its unſteadineſs beyond the firſt half inch will have no influence on the direction of the ſhot: and hence a more compendious method of conſtructing plat-forms may be found out. New Princip. of Gunnery, p. 42.

Plat-form, in *Architecture*, is a row of beams, which ſupport the timber-work of a roof, and lie at the top of the wall where the entablature ought to be raiſed.

Plat-form is alſo uſed for a kind of terrace, or broad, ſmooth, open walk, at the top of a building, from whence we may take a fair proſpect of the adjacent country.

Hence an edifice is ſaid to be covered with a plat-form, when it is flat at top, and has no ridge.

Moſt of the oriental buildings are thus covered, as were all thoſe of the ancients. Cæſar was the firſt among the Romans who procured leave to build his houſe with a ridge or pinnacle.

Plat-form, in a *Man of War*. See Orlop.

PLATIA, in *Geography*, a ſmall iſland in the gulf of Engia; 18 miles N.W. of Engia.

PLATIASMOS, of πλατιαζω, *I dilate*, formed from πλατυς, *wide*, a word uſed by many authors to expreſs a fault in pronunciation, owing to a perſon's opening his mouth too wide, and thence ſpeaking indiſtinctly.

PLATICORIA, formed of πλατυς, *wide*, and κορη, *pupil*, a word uſed by medical writers to expreſs a preternatural dilatation of the pupil of the eye, uſually owing to a paralytic diſorder.

PLATILLA, La, in *Geography*, a mountain of Spain, N.W. of Molina; celebrated for its mines of copper.

PLATINA, Bartolommeo, in *Biography*, an hiſtorian who flouriſhed in the 15th century, was born in 1421, at Piadena, in the Cremoneſe, from which place he choſe to take his ſurname, rather than from that of the family to which he belonged, which was De Sacchi. He was brought up to the military profeſſion, and bore arms ſome time before he engaged in literary ſtudies, which he probably firſt purſued at Mantua. He accompanied cardinal Franceſco Gonzaga to Rome, where Pius II. aggregated him to his new college of abbreviators. He was deprived of his poſt by Paul II., who diſſolved the college, and turned on the world, without any means of ſupport, ſeventy learned men, who had been employed in it. Platina, who had more ſpirit than the others, wrote to the pope, threatening him with an appeal to a council. This menace enraged Paul to ſuch a degree, that he threw Platina into priſon, where he was kept four months, till he obtained his liberty by the interceſſion of cardinal Gonzaga. Three years after this he underwent a more ſevere treatment, on occaſion of a conteſt between the ſame pope and the Roman academy of Pomponio Leto, of which Platina was a member. It appears from Platina's own account of this tranſaction, that he himſelf was apprehended while at ſupper with cardinal Gonzaga, brought before the pope, and urged with threats to confeſs a ſuppoſed conſpiracy againſt him; and that he was committed to priſon, becauſe he avowed his perfect innocence of the crime laid to his charge. He and ſeveral of his friends were put to the torture twice, but when nothing could be found to criminate them, they were gradually liberated. Platina obtained from Sixtus IV. a recompence for his ſufferings, in the honourable poſt of keeper of the Vatican library, which he held till his death in 1481. In the following year there was a solemn commemoration of the anniversary of his death. He was considered as one of the ablest scholars of his time. His most celebrated work was the "Lives of the Roman Pontiffs," composed in Latin with great elegance and energy. "It was," says the historian, "one of the first pieces of biographical history which gave an example of good criticism. He frequently examines, doubts, conjectures, cites ancient documents, refutes errors, and sometimes, as might be expected, commits them himself. His greatest fault is the acrimony with which he speaks of some contemporary popes, among whom it may well be supposed that he does not spare Paul II." He was likewise author of the "History of Mantua," from its origin to the year 1464. His other writings are chiefly dialogues on points of moral philosophy, and short treatises on miscellaneous topics: among the latter is one on the culinary science; and what renders this still more curious is, that it is dedicated to cardinal della Rovere. Moreri. Gen. Biog.

Platina, or *little silver*, from the Spanish word *plata*, silver; called also *platinum* by some late English chemical writers; in French *le platine*.

Platina, not being liable to oxydation by the agencies of heat, air, or moisture, is usually classed with gold and silver, which possess the same property; and these three metals were formerly, and are still sometimes called the *noble* metals, in opposition to the *base* metals, or those which are oxydable by air and moisture.

It is only about sixty years since platina was introduced into Europe. The first specimens which reached this country were brought from America by Mr. Wood in the year 1749; in the following year some others were presented to the Royal Society by Dr. Brownrig, soon after which Mr. Wood, Dr. Lewis, Bergman, and other chemists, began to examine the properties of this metal. Of late years, Morveau, Jeannetty, Vauquelin, Descotils, and more especially Wollaston and Tennant, have greatly contributed to our knowledge of this substance. The free importation of platina into Europe was for a long time jealously prevented by the Spanish government, from an apprehension that advantage might be taken of its specific weight, and other general properties, to adulterate gold with it, an objection which the present improved state of chemistry has entirely removed.

Natural History.—Platina was for a long time supposed to be the exclusive produce of South America, where it is found in various places, particularly on the banks of the Rio del Pinto, in the district of Choco in Peru; in the mines of Taddo, near the Rio de la Plata in the same district; in the mine of Santa Fé near Carthagena, in New Granada, (Klaproth's Dictionary of Chemistry, iii. 363.); and also, as Dr. Wollaston has lately shewn, in a new mineral from the gold mines in Brazil. (Philos. Trans. 1809, part ii.) Of late years, however, Vauquelin has also discovered platina in Europe, in a grey silver ore from the mines of Guadalcanal, in the province of Estramadura in Spain. Ann. de Chimie, vol. lx.

The natural history of this metal is but imperfectly known. But it is well ascertained that platina is found in its native state in small fragments or grains, loosely mixed with the sand of certain streams, always accompanying gold, and generally interspersed with a variety of other metallic and heavy earthy bodies. The greater part of these impurities is separated from the ore in America; so that when it reaches Europe, it appears in the form of pretty uniform metallic grains, which are neither round nor angular, but are somewhat flattened and smooth; their colour is a greyish-white; they appear to be partly attracted by the magnet, which is no doubt owing to the iron always mixed with them. Their size varies from that of fine sand to that of a pea. No veins or considerable masses of pure platina have ever been discovered. Some fragments, however, weighing from 10 to 40 grains, have occasionally been found, and are preserved as mineralogical curiosities. An extraordinary large specimen of this kind, exceeding the size of a pigeon's egg, is said to have been given by Humboldt to the National Museum of France; it weighs 1088 grains, and its specific gravity is 15.6. It was found in 1800, in the mines of Taddo, in the district of Choco. Klaproth's Dictionary of Chemistry.

Platina, in the granular form just described, which is properly that of an ore, still containing a variety of impurities, fluctuates in its specific gravity between 15 and 17. In one instance Dr. Wollaston saw it reach 17.7; but this is the heaviest specimen he ever met with. (Phil. Trans. 1805.) This ore scarcely contains 80 *per cent.* of the pure metal, and sometimes much less; the remainder being a mixture of a great variety of other minerals, such as gold, silver, mercury, iron, copper, lead, chrome, titanium, (Fourcroy and Vauquelin, Annales du Musée, tom. iii.); and, what is very remarkable, no less than four new metals, iridium, osmium, rhodium, and palladium, the existence of which was not even suspected till a few years ago, and which have never been found elsewhere. Various earthy minerals, and especially quartz and hyacinth, are also occasionally found mixed with this ore in different proportions. Wollaston, Phil. Trans. 1805.

Purification of the Ore.—Before we describe the properties of platina as a metal *sui generis*, it will be proper to relate the manner in which it is obtained, in a pure and malleable state, from the granular mixture just described.

Various difficulties occur, not only in separating the platina from the other bodies with which it is mixed in the ore, but also, and principally, in bringing the metal to the state of a consolidated malleable mass.

With regard to the separation and purification of platina, this might be effected in an imperfect manner, by selecting and picking out the grains of platina, which are discernible from the other ingredients by their external characters. This, however, would be a most tedious process, and the grains of platina would still be found to contain various impurities, and particularly iron, which would prevent their subsequent consolidation into a malleable mass. Besides, the great infusibility of platina would render such a mode of consolidation, if not impracticable, at least extremely difficult. After trying a variety of methods, more or less imperfect, for the purification of platina, chemists have generally adopted the following process.

The first step consists in separating from the platina ore small globules of quicksilver, which are generally found mixed with it, in consequence of a process of amalgamation, which it undergoes in America, in order to separate the gold from it, when it is first collected. These are easily driven off by a moderate heat. A considerable portion of the other impurities may be easily separated, in consequence of their greater levity: thus, by blowing upon a quantity of these grains, spread over an inclined plane, with a common pair of bellows, the lighter particles, such as those of quartz and iron ore, are readily driven off from those of platina.

The gold, some portions of which always escape the process of amalgamation just mentioned, may be next separated by pouring a small quantity of dilute nitro-muriatic acid upon the grains of crude platina. The quantity of gold thus taken up commonly amounts to about a quarter of a

grain

grain from each ounce of the ore; but as much as 7, or in one inſtance as much as 13, parts of gold are ſaid to have been obtained from 100 parts of the ore. (Prouſt, Ann. de Chim. vol. xxxviii.) In this firſt operation, a ſmall quantity of platina and other ingredients will alſo be diſſolved; but the gold may be eaſily precipitated from this ſolution by ſulphate of iron, and the platina by muriate of ammonia.

After the ſeparation of the gold, nitro-muriatic acid, being poured on the remaining maſs, will diſſolve it, with the exception of a ſmall quantity of black matter (about 3 *per cent.*), which was formerly miſtaken for plumbago, but is now proved to be a compound of oſmium and iridium, two of the four new metallic bodies before mentioned, which were diſcovered a few years ago by Mr. Tennant. See IRIDIUM and OSMIUM; and Phil. Tranſ. for 1804.

Theſe two metals Dr. Wollaſton has ſince ſhewn to exiſt alſo in the crude platina ore, united together in the form of diſtinct minute cryſtals, and diſperſed through the other grains, from which they can be diſtinguiſhed and picked out without difficulty. (Phil. Tranſ. for 1805.) Muriate of ammonia being now added to the ſolution, the platina is precipitated in the form of a yellowiſh powder, which is a compound of muriatic acid, ammonia, and platina, or an ammoniaco-muriate of platina.

The remaining ſolution, after the platina has been ſeparated from it, ſtill contains, beſides iron, minute quantities of various other ſubſtances, amongſt which the two other metallic bodies, palladium and rhodium, were diſcovered by Dr. Wollaſton. Phil. Tranſ. for 1804 and 1805. See alſo PALLADIUM and RHODIUM.

Conſolidation.—Having now brought the platina to the ſtate of a ſalt, the next object is to reſtore the platina, thus purified, to its metallic ſtate, and to conſolidate it into a malleable maſs. This, from the great infuſibility of platina, has long been a matter of conſiderable difficulty and labour; and although the proceſs has been, of late years, conſiderably improved and ſimplified, it ſtill requires from the operator a certain degree of dexterity and experience.

Before we deſcribe the improved proceſs in queſtion, it may be proper to notice the earlier and leſs ſucceſsful attempts, which were made for the conſolidation of platina.

It had been long diſcovered that arſenic readily united with platina, and formed with it an alloy of great fuſibility. An alloy, therefore, was made of crude platina and arſenic; and the latter metal, being eaſily volatilized, was driven off by heat; whilſt the iron, being oxydated during the proceſs, was alſo ſeparated from the maſs; ſo that the platina was left in an impure, but malleable ſtate. This mode of conſolidation of the crude ore by means of arſenic, firſt propoſed by Achard and others, was brought to a great degree of improvement by Jeannetty, a working ſilverſmith of Paris (Ann. de Chim. vol. xiv.); and utenſils of platina were procured by his method at a reaſonable price. But the platina ſo prepared was far from being pure; for it had a lower ſpecific gravity, and ſtill contained ſmall portions of arſenic, iron, lead, copper, beſides the four new metals above mentioned; and it did not, therefore, poſſeſs in a ſufficient degree thoſe qualities which render platina ſo uſeful for its various purpoſes.

The late improvements in the proceſs conſiſt principally in obtaining the platina, not immediately from the crude ore, but from the ammoniaco-muriate above mentioned. By applying heat to this ſalt, the muriated ammonia is gradually expelled, and the metal paſſes to the ſtate of a ſpongy maſs, which, by patient and repeated heating and hammering in a ſtrong mould, is at laſt brought to a malleable ſtate. Count Mouſſin Pouſchkin was, we believe, the firſt perſon who propoſed to prepare platina from the ammoniaco-muriate (Nicholſon's Journal, vol. ix.); but he uſed mercury in the proceſs. An amalgam was formed with the ſpongy maſs above deſcribed; and by ſucceſſively heating and hammering this amalgam, the mercury was driven off, and the metal was conſolidated into a malleable maſs. This method was afterwards farther ſimplified by other chemiſts, the intervention of mercury being altogether diſpenſed with. One of the earlieſt accounts of this laſt improvement was publiſhed by Mr. Knight. (Phil. Mag. vol. vi.) But the moſt perfect deſcription of this mode of working platina, that has yet been publiſhed, is that given by Mr. Cock, in Aikin's Dictionary, vol. ii. p. 233, which, being ſcarcely ſuſceptible of abridgment, we ſhall tranſcribe *verbatim*. "The platina being diſſolved in nitro-muriatic acid, the liquor is to be filtered through clean white ſand, in order to ſeparate the black powder which floats among it. The clear ſolution being then decompoſed by ſal-ammoniac, the yellow precipitate is to be collected, moderately well waſhed in warm water, and dried. It is then to be diſtributed into ſaucers, which are placed in a ſmall oven conſtructed for the purpoſe, where they are expoſed for a ſhort time to a low red heat, in order to bring the platina to the metallic ſtate, and drive off by ſublimation the greater part of the muriated ammonia. When withdrawn, it is a ſpongy maſs of a grey colour. About half an ounce of the platina in this ſtate is to be put into a ſtrong iron mould, about $2\frac{1}{2}$ inches long, by $1\frac{1}{2}$ wide, and is to be compreſſed as forcibly as poſſible, by ſtriking with a mallet upon a wooden peſtle, cut ſo as accurately to fit the mould: another half ounce is then added, and treated in the ſame manner; and ſo on, till ſix ounces have been forced into the mould. A looſe iron cover, juſt capable of ſliding down the mould, is then laid upon the platina, and, by means of a ſtrong ſcrew preſs, almoſt every particle of air is forced out from the platina. This is a part of the proceſs that requires eſpecial care; for if any material quantity of air is left in the maſs, the bar into which it is formed is very apt, in the ſubſequent operations, to ſcale and be full of flaws. The preſſure being duly made, the mould is to be taken to pieces, and the platina will be found in the form of a denſe compact parallelopiped. It is now to be placed in a charcoal forge fire, and heated to the moſt intenſe white heat, in order completely to drive off the remaining ammoniacal muriate. This being done, it is to be quickly placed on a clear bright anvil, and gently hammered in every direction by a clean hammer. This is to be repeated ſeveral times, at the end of which the maſs will be perfectly compact, and fit to be laminated or wrought in any other manner that the artiſt chooſes. It is to be obſerved, that while the platina is heating, it muſt lie looſe in the fire; for if it were held by the tongs, they would infallibly become welded to the platina, and thus greatly damage it. By the time that the platina is thus drawn down to a compact bar, it will be covered by a ſomewhat reddiſh ſemi-vitreous cruſt, proceeding chiefly from particles of the aſhes melted down upon it, and extended over its ſurface by the hammer. To remove this, the bar, being made red-hot, is to be ſprinkled over with pulverized glaſs of borax, and then kept for a few minutes at a white heat. When moderately cool, it is to be plunged into dilute muriatic acid, by which the borax and other vitreous matter will be diſſolved, leaving the platina with a perfectly clean white ſurface."

It is by methods of this kind that utenſils of platina, though ſtill expenſive, have gradually become leſs ſcarce, and are now much uſed in chemical manipulations. The

 metal

metal may now (1814) be purchaſed in bars at the rate of 15*s.* an ounce; whilſt a few years ago, its price was between two and three times as great. The price of platina, in grains, fluctuates between 3*s.* and 4*s.* an ounce.

Phyſical and Chemical Properties of Platina.—The colour of pure platina is between ſilver-white and ſteel-grey; its ductility and malleability are very great; it can be brought to the ſtate of laminæ of almoſt any thinneſs by being preſſed between rollers; and it can alſo be drawn into wire of extreme minuteneſs. In hardneſs, platina is ſcarcely inferior to iron, and it is ſuſceptible of a fine poliſh; ſo that coin or medals made of pure platina would admit of very fine impreſſions, and, like gold, would not be liable to alteration.

The ſpecific gravity of malleable platina is generally found to be about 21.3, never riſing to 22 or 23, as ſome French chemiſts have erroneouſly ſtated; but being ſubject to ſlight variations according to the different degrees of denſity it has received during the proceſs of hammering. Gold, the next heavieſt metal, is 19.3; and therefore the denſity of platina is much more conſiderable than that of any other known ſubſtance. In its native ſtate, however, the ſpecific gravity of the platina ore does not, as was obſerved before, exceed 17.7; whilſt that of the grains of iridium and oſmium above mentioned is 19.15, which is a higher degree of ſpecific gravity than that of any other known *native* ſubſtance.

The great ductility of platina has been put in a very ſtriking light by ſome recent experiments of Dr. Wollaſton. (Philoſ. Tranſ. for 1813.) This philoſopher, whoſe dexterity in mechanical operations is no leſs conſpicuous, than his views in natural ſcience are acute and refined, ſucceeded, by a new and ingenious proceſs, in drawing platina wire ſo ſmall as the $\frac{1}{10000}$dth, or even $\frac{1}{18000}$dth part of an inch in diameter; and the tenacity of the latter was ſtill ſuch as to ſupport 1 $\frac{1}{3}$d grain without breaking. The method by which Dr. Wollaſton ſucceeded in obtaining ſuch very fine wire was ſhortly this: a piece of platina wire, previouſly drawn, by the uſual means, to the $\frac{1}{100}$dth of an inch, was fixed longitudinally in the centre of a ſhort cylindrical mould of $\frac{1}{3}$d of an inch in diameter; the mould being afterwards filled with melted ſilver, a cylinder of this metal was obtained, having the platina wire in its centre. Now it is evident, that by drawing the ſilver rod to $\frac{1}{30}$th, the platina wire was reduced to $\frac{1}{1000}$dth of an inch; and this was repeated, till, by a ſucceſſion of ſimilar reductions, the extremely ſmall wires above-mentioned were obtained. The ſilver coating was then removed by dilute nitrous acid, which left the platina wire untouched. Very fine wires of this kind have been employed by Dr. Wollaſton to meaſure the intenſity of very ſmall Voltaic batteries, and have alſo been applied to ſome optical purpoſes.

But the moſt characteriſtic property of platina, from which it derives its great value, is that of being neither oxydable by the combined influence of heat, air, and moiſture, nor capable of being fuſed by the moſt powerful furnaces: on this account crucibles and other utenſils are made of this metal, which are ſingularly uſeful in chemical experiments. In the ſtate of wire, however, it can be fuſed and reduced to the ſtate of globules by a very powerful Voltaic battery; and Dr. Marcet has ſhewn that the ſame may be effected with great eaſe by the flame of a ſpirit lamp impelled by a current of oxygen gas. (Thomſon's Annals of Chemiſtry, vol. ii.) Platina which has been thus melted, appears to be ſomewhat more ductile and tenacious; and it was from globules melted by the latter method, that the extremely fine wire above-mentioned was obtained. Platina wire, provided it be exceedingly fine, is alſo capable, as Tennant and Berzelius have lately obſerved, of being melted by the common blowpipe; but the globule thus obtained is ſo minute as to be ſcarcely ponderable.

Although platina can only be fuſed in very ſmall quantities, whatever method be employed, it poſſeſſes, at a white heat, the valuable property of welding like iron; ſo that two pieces, when heated to the proper point, may be forged together and united into one uniform maſs. This, however, is not very eaſily effected, on account of the impurities which ariſe from the fuel and impede the operation.

Platina is not acted upon by any of the acids, except by the nitro-muriatic or oxymuriatic. If two parts by weight of aquafortis of 35°, Beaumé, be mixed with ſix parts of muriatic acid of 15°, and digeſted with this laminæ of platina, nitrous gas is given out, and about one part of the metal is diſſolved. (Prouſt, Ann. de Chim. vol. xxxviii.) This ſolution is of a reddiſh-orange colour, and gives an indelible ſtain to the ſkin. The muriate of platina is capable of being cryſtallized by careful evaporation; and by the application of heat alone, it may be reduced firſt to the ſtate of oxyd, and afterwards to the pure metallic ſtate.

Platina, thus diſſolved in nitro-muriatic acid, has the property, (firſt diſcovered by Lewis, and already alluded to in deſcribing the purification of platina,) of being precipitated by muriate of ammonia, in the form of a triple ſalt, or ammoniaco-muriate of platina. This ſalt, if pure and unmixed with other metals, is of a yellow colour; but it is ſaid to aſſume a brick-red colour if combined with the oxyd of iron, or the other metals which are mixed with crude platina. The ammoniaco-muriate of platina is but very ſparingly ſoluble in water. It is decompoſed by heat alone, leaving behind about 42 *per cent.* of its weight of platina; ſo that, in this inſtance, the metal paſſes from the ſtate of ſalt to the reguline ſtate, without appearing in the intermediate form of oxyd.

Both ſoda and potaſh, in precipitating platina from its ſolution, alſo form triple ſalts, the general properties of which are analogous to thoſe of the former. There is, however, this remarkable difference between the action of the two fixed alkalies on muriate of platina, that ſolutions of this ſalt, however dilute, are inſtantly precipitated by potaſh or its compounds; whilſt ſoda does not produce any precipitates from them, the ſoda-muriate being much more ſoluble than the two others, both in water and alcohol, and requiring conſiderable concentration for its cryſtallization. A ſolution of platina, therefore, affords an eaſy teſt of diſcrimination between the two fixed alkalies, which are not always eaſily diſtinguiſhable by their other properties.

Solutions of muriate of platina are decompoſed by ſeveral metallic ſalts, particularly by ſolution of muriate of tin, a very minute quantity of which will impart to ſolutions of platina a bright red colour. Platina, however, is not precipitated by the gallic and pruſſic acids, or by their compounds. Sulphuretted hydrogen ſeparates platina from its ſolution in the form of a brown precipitate.

The action of the cauſtic fixed alkalies on platina, at high temperatures, is conſiderable. The metal is corroded and partly diſſolved, a circumſtance which, of courſe, limits the uſe of platina crucibles in the analyſis of earthy minerals. Nitre, likewiſe, as Mr. Tennant has ſhewn, is capable of acting upon, and partly diſſolving platina, at high temperatures.

Platina is capable of combining, by fuſion, with moſt of the metals. It forms alloys with gold, with ſilver, with lead, &c., many of which have been examined by Mr. Hatchett. (Philoſ. Tranſact. 1803.) The alloy of platina and gold, in particular, poſſeſſes properties, eſpecially

in

in regard to its hardnefs and malleability, which may fome day be found ufeful. The alloy of platina and filver is moderately fufible and very malleable; but when heated to rednefs, its furface becomes uneven, and incapable to be wrought. Lead combines readily with platina at a full red heat, forming a malleable and eafily fufible alloy. Mercury acts but flowly upon platina in its malleable ftate; but the triple falt, or ammoniaco-muriate, readily combines with mercury by trituration, forming folid and brilliant amalgams.

Platina does not appear to be capable of combining with fulphur; but it unites readily with phofphorus, forming a phofphuret of much greater hardnefs and fufibility than the metal itfelf. When expofed to a ftrong fire, the phofphorus is melted and volatilized; a circumftance which has fuggefted the idea of purifying platina by the intervention of phofphorus. Pelletier, Ann. de Chim. xiii. 105.

Platina has not hitherto been extenfively ufed in the arts on account of its high price; but its utility is becoming every day more generally acknowledged. From its great infufibility and unalterability in particular, crucibles, and other utenfils made of this metal, are of incalculable value in analytical refearches. Many facts are daily brought to light by means of platina inftruments, which, without it, might perhaps ever have efcaped notice. The remarkable flownefs with which platina conducts caloric, increafes its utility in many chemical manipulations. Thus fmall tongs or fpoons, or thin flips of laminated platina (which often anfwer the purpofe better than fpoons) may be held with the hand by one end, whilft the other extremity is expofed to an intenfe heat, without the heat reaching the fingers. The touch-holes of guns are now generally made of this metal, inftead of gold, which was formerly ufed for this purpofe. From the circumftance of platina not being tarnifhed by air or moifture, nor fcarcely by any chemical agent, mirrors for reflecting telefcopes have been made of this metal; and inftruments of various kinds might, no doubt, be covered over or plated with it with great advantage.

Guyton Morveau has recommended platina as a fubftance likely to afford a new and ufeful means of afcertaining high temperatures, by its dilatations and contractions, which he believes to bear an exact proportion to the changes of temperature. Platina being nearly infufible and unalterable by heat and air, would feem, on thefe accounts, likely to be a valuable pyrometrical fubftance. Morveau's contrivance confifted in connecting a bar of platina with a very fimple machinery, by which the elongations or contractions of the portion of the apparatus which was expofed to the heat, were rendered confpicuous, and could be accurately meafured. Ann. de Chim. tom. xlvi.

Platina veffels have, in a few inftances, been ufed upon a large fcale in manufactories, efpecially in the concentration of vitriolic acid, which is ufually carried on in large glafs retorts, containing as much as 50 or 60 pounds of acid. The burfting of thefe veffels, an accident both dangerous and expenfive, and by no means uncommon, may be totally avoided by fubftituting veffels of platina. A veffel of this metal, containing 300 pounds of vitriolic acid, has, for many years, been ufed for this purpofe in the manufactory of Mr. Sandman in the Borough. Still larger veffels have fince been ufed for the fame purpofe by other manufacturers. The diftillation is alfo more eafy, becaufe the veffel is fet upon a naked fire, inftead of being placed in a fand bath.

The metallic glazing, with which fome kinds of earthen ware and porcelain utenfils have, for a few years paft, been coated, is obtained from oxyd of platina. (Klaproth's Dictionary, iii. 380.) This glazing has a brilliant filvery, or rather fteel-grey luftre. The ammoniaco-muriate of platina is faid to be commonly employed in Britifh potteries for this purpofe.

PLATISMA, in *Botany*, from πλατυς, *broad*, the name of the nineteenth fection of Lichens, in the Prodromus of Acharius. See LICHENES.

PLATNER, JOHN ZACHARIAH, in *Biography*, an able phyfician, was born at Chemnitz, in Mifnia, in Auguft 1694. His father, who was one of the principal merchants of the place, intended to make him his fucceffor in the fame line; but refolved to enlarge his mind by a liberal education, and to give him a knowledge of ancient languages and philofophy, before he led him into commercial purfuits. But young Platner poffeffed a delicate conftitution; and, partly on this account, and partly in confideration of the rapid progrefs which he made in his ftudies, his parents relinquifhed their original defign, and confented that he fhould direct his attention to medicine, for which he had manifefted a ftrong inclination. He repaired, therefore, to Leipfic in 1712, where he purfued his ftudies for the fpace of three years, when the reputation of the univerfity of Halle induced him to vifit its fchools. During the following winter, he ftudied mineralogy and metallurgy in the celebrated mines of Chemnitz; after which he returned to Halle, and received the degree of doctor in September 1716. The purfuit of profeffional knowledge became his paffion, and he fpent four years in vifiting the moft celebrated feats of learning in Europe. At Paris he particularly attended to anatomy and furgical operations, efpecially to thofe relative to difeafes of the eye, in which he is faid by Haller to have acquired fuch dexterity, as to have fucceeded in the cure of fome, which the celebrated St. Ives had failed to relieve.

He now determined to fettle at Leipfic, and accordingly fixed himfelf in that city in 1720; and his great profeffional acquirements were fpeedily rewarded by public acknowledgements of their value. In 1721 he was appointed profeffor extraordinary of anatomy and furgery. In 1724 he obtained the chair of phyfiology, which had become vacant by the death of Rivinus; in 1737 he was promoted to the profefforfhip of pathology; and in 1747 to that of therapeutics. He was alfo nominated perpetual dean of the faculty, and confulting phyfician to the court of Saxony. He did not live long, however, to enjoy thefe flattering diftinctions; for he was carried off fuddenly, on the 19th of December 1747, in the fifty-fourth year of his age, by a paroxyfm of afthma. He had vifited his patients on the morning of that day, and given his lecture after dinner; and upon returning home, about fix in the evening, was feized with the fatal fit.

He left only three different works, the firft of which, entitled "Inftitutiones Chirurgiæ Rationalis, tum medicæ, tum manualis," Leipfic 1745, was publifhed by himfelf. It paffed through feveral editions. The fecond, entitled "Opufculorum Chirurgicorum et Anatomicorum Tomi duo: Differtationes et Prolufiones," ibid. 1749, was edited by his fon, Frederic Platner, a profeffor of law. And the third, entitled "Ars medendi fingulis morbis accommodata," ibid. 1765, which had been bequeathed by the author to his pupil J. B. Boehmer, upon condition that it fhould not be publifhed, was printed by a bookfeller, Fritfch, into whofe hands a copy of it fell eighteen years after the author's death. Eloy Dict. Hift. de la Med.

PLATO, a Greek comic poet, who flourifhed about the clofe of the fifth century B.C., was contemporary with Ariftophanes and Euripides. He is faid to have left twenty-

twenty-eight comedies, of which the titles of many are to be found in Athenæus, Pollux, and other writers. Of his works, only a few fragments remain, ſome of which are of the epigrammatic kind.

PLATO. See PLATONISM.

We ſhall here obſerve, that Plato, Ariſtotle, Ariſtoxenus, and Plutarch, were for ever complaining of the corruption and degeneracy of muſic. The pious Plato, indeed, regarded it as fit only for the gods, and their celebration in religious ceremonies, or as a vehicle for religious and moral lectures in the education of youth; and with a methodiſtical ſpirit cenſured all ſuch as was uſed in theatres, ſocial feſtivity, or domeſtic amuſement: but modern divines might, with equal propriety, declaim againſt the profane uſe of bread as an aliment, becauſe it is adminiſtered in the moſt ſolemn rite of our religion. A line ſhould certainly be drawn between the muſic of the church and of the theatre; but totally to ſilence all muſical ſound, except upon ſolemn occaſions, ſeems to border upon downright fanaticiſm.

With reſpect to perfection and depravity, there is nothing ſo common among muſical diſputants, as for the favourers of one ſect to call that *degeneracy*, which thoſe of another call *refinement*. But Plato ſeems to have been always too fond of ideal excellence in every thing, to be ſatisfied with any other. His complaints of the degeneracy of muſic, may be ſeen in his third Book of Laws. The poets, indeed, never fail to charge the corruption of muſic upon its profeſſors, yet Plato throws the blame upon the poets themſelves. "The muſic of our forefathers," ſays he, "was divided into certain ſpecies and figures. Prayers to the gods were one ſpecies of ſong, to which they gave the name of hymns: oppoſed to this was another ſpecies, which, in particular, might be called threni; another, pæones; and another, the birth of Dionyſius, which I hold to be the dithyrambus: there were alſo citharœdic nomi, ſo called, as being ſtill another ſong. Theſe, and ſome others, being preſcribed, it was not allowable to uſe one ſpecies of melos for another. But, in proceſs of time, the poets firſt introduced an unlearned licence, being poetic by nature, but unſkilled in the rules of the ſcience, trampling upon its laws, over attentive to pleaſe, mixing the threni with the hymns, and the pæones with the dithyrambi, imitating the muſic of the flute upon the cithara, and confounding all things with all." Plat. de Legibus, as tranſlated by ſir F. H. E. Stiles. Though it was Plato's opinion, that the government of a ſtate, and the morals of a people, would be affected by a change in the national muſic, yet this was not the opinion of Cicero, who in many other particulars is a rigid Platoniſt: "Change," ſays this orator, "the government or cuſtoms of a city, and it will certainly change the muſic." De Legib. lib. iii.

It has been ſaid by many writers, both ancient and modern, that Plato was deeply ſkilled in the muſic of his time; but it does not appear that his claims to ſkill in this art extend further than to mere theory, or a very little more. Plutarch, indeed, in his dialogue, proves his profound muſical ſcience; but how? By a long paſſage from his Timæus, in which he applies muſical ratios to the ſoul.

However this may have been, it is difficult to refrain from numbering this philoſopher, together with Ariſtotle, Ariſtoxenus, and Plutarch, though ſuch illuſtrious characters, and, in other particulars, ſuch excellent writers, among the muſical grumblers and croakers of antiquity. They all equally lament the loſs of good muſic, without conſidering that every age had, probably, done the ſame, whether right or wrong, from the beginning of the world; always throwing muſical perfection into times remote from their own, as a thing never to be known but by tradition. The golden age had not its name from thoſe who lived in it.

Ariſtotle, indeed, complains of degeneracy in a more liberal way: "every kind of muſic," ſays he, "is good for ſome purpoſe or other; that of the theatres is neceſſary for the amuſement of the mob; the theatrical tranſitions, and the tawdry and glaring melodies in uſe there, are ſuited to the perverſion of their minds and manners, and let them enjoy them."

The complaints of Ariſtoxenus are more natural than thoſe of Plato and Ariſtotle; for he was not only leſs a philoſopher, but more a muſician; and, as a profeſſor, and an author on the ſubject of muſic, he muſt have had rivals to write down. Heſiod ſays that bards hate bards, and beggars beggars. And it has been the practice for writers on muſic, in all ages, to treat their contemporaries with ſeverity and ſcorn. Gaſpar Printz inſerts in his book a canzonet in four parts, in which every rule of compoſition is violated, and calls it modern; as if error was always new. But beſides a natural tendency in human nature, or at leaſt in the nature of authors, towards envy and malignity, Ariſtoxenus had a ſyſtem to ſupport, which is uſually done at the expence of moderation, truth, and every thing that ſtands in its way; for, like the tyrant Procruſtes, the builder of a ſyſtem, or the defender of an hypotheſis, cuts ſhorter what is too long, and ſtretches to his purpoſe whatever is too ſhort.

The muſic of the Greeks, in the time of Ariſtoxenus, was too remote from perfection to be much injured by innovation and refinement; and yet Athenæus gives a paſſage from a work of this writer, now loſt, in which he makes the following complaints: "I, and a few others, recollecting what muſic once was, and conſidering what it now is, as corrupted by the theatre, imitate the people of Poſſidonium, who annually celebrate a feſtival after the Greek manner, in order to keep up the memory of what they once were; and before they depart, with tears deplore the barbarous ſtate into which they are brought by the Tuſcans and Romans."

Though Ariſtoxenus lived with Alexander the Great, with Plato, and with Ariſtotle, when all other arts and ſciences had arrived at their greateſt degree of force and refinement; yet muſic, from whatever cauſe, does not ſeem, at that, or at any time, to have kept pace with other arts in its improvements: at leaſt, it did not in Italy; nor, indeed, in England or France, if we compare the poetry of Milton with the muſic of Henry Lawes, or the writings of Racine and Boileau, with the compoſitions of Lully.

PLATOBERG, in *Geography*, a mountain of France, in the department of Mont Tonnerre; four miles N. of Landau.

PLATONIA, in *Natural Hiſtory*, a name given by the modern Greeks to the *prox* of Ariſtotle, and of other ancient writers in that language. This is the *cervus platyceros*, or broad-horned ſtag. Some have tranſlated this *dama*; but they are to be underſtood in this as meaning the *dama* of their own times, not that of the ancients; that being the *iſarus*, or chamois-goat, not any animal of the ſtag kind, or by any means meriting that title.

PLATONIC, ſomething that relates to Plato, his ſchool, philoſophy, opinions, or the like.

PLATONIC *Bodies*, are the ſame with what we otherwiſe call regular bodies.

PLATONIC *Love* denotes a pure ſpiritual affection, ſubſiſting between the different ſexes, abſtracted from all carnal appetites, and regarding no other object but the mind, and its beauties; or it is even a ſincere diſintereſted friendſhip ſubſiſting between perſons of the ſame ſex, abſtracted from any ſelfiſh views, and regarding no other object but the perſon.

The term took its riſe from the philoſopher Plato, a ſtrenuous advocate for each kind.

The world has a long time laughed at Plato's notions of love and friendſhip. In effect, they appear arrant chimeras, contrary to the intentions of nature, and inconſiſtent with the great law of ſelf-preſervation; into which love and friendſhip are both ultimately reſolvable.

Platonic *Year*, or the *great year*, is a period of time determined by the revolution of the equinoxes, or the ſpace in which the ſtars and conſtellations return to their former places, in reſpect of the equinoxes.

The Platonic year, according to Tycho Brahe, is 25816; according to Ricciolus, 25920; and according to Caſſini, 24800 years. See Precession *of the Equinoxes*.

This period, which is more than five times the age of the world, once accompliſhed, it was an opinion among the ancients, that the world was to begin anew, and the ſame ſeries of things to return again.

PLATONISM, the doctrine and ſentiments of Plato and his followers, with regard to philoſophy, &c.

The founder of this ſyſtem of philoſophy, Plato, the ſon of Ariſto, was an Athenian, related by his father to Codrus, and by his mother to Solon; born in the iſland of Ægina, where his father reſided after it became ſubject to Athens, on the ſeventh of Thargelion, in the firſt year of the 88th olympiad, B.C. 428, or, as it may be more accurately fixed, in the third year of the 87th olympiad, B.C. 430.

He gave early indications of a diſtinguiſhed genius; and whilſt he was young he was inſtructed in the rudiments of letters by the grammarian Dionyſius, and trained in athletic exerciſes by Ariſto of Argos. He applied with induſtry to the ſtudy and practice of painting and poetry. In the latter he made ſuch proficiency as to produce an epic poem, which, however, upon comparing it with Homer, he committed to the flames; and at the age of 20 years he compoſed a dramatic piece, which he delivered to the performers in order to its being exhibited on the theatre; but in the mean while he became acquainted with Socrates, and ſo much enamoured of his philoſophy, that on the day before it was to have been repreſented to the public he withdrew it, and gave up all ideas of poetical diſtinction. After having ſpent his youth in exerciſes of the body, painting, poetry, and muſic, he became, at the age of twenty years, a diſciple of Socrates, and applied himſelf wholly to the ſtudy of wiſdom. It is ſuppoſed, that he received the firſt tincture of philoſophy from Cratylus and Hermogenes, who taught the ſyſtems of Heraclitus and Parmenides. But having become a ſtated diſciple of Socrates, he remained with him eight years. Blending, however, foreign tenets with thoſe of his maſter, and grafting upon the Socratic ſyſtem opinions which he had taken from ſome other ſtock, he occaſionally diſpleaſed the followers of Socrates, and ſometimes gave Socrates himſelf occaſion for complaint. Nevertheleſs, he retained a zealous attachment to this maſter, and when he was ſummoned before the ſenate, Plato undertook to plead his cauſe, and began a ſpeech in his defence, which the partiality and violence of his judges would not allow him to proſecute. After the condemnation of Socrates, he preſented him with money ſufficient for redeeming his life, which, however, this eminent teacher of wiſdom refuſed to accept. During his impriſonment, Plato attended him, and was preſent at a converſation which he held with his friends concerning the immortality of the ſoul, the ſubſtance of which he afterwards committed to writing, in the beautiful dialogue entitled "Phædo," intermixing occaſionally his own opinions and language. Upon the death of his maſter he withdrew, with ſeveral other friends of Socrates, to Megara, where they were hoſpitably entertained by Euclid, and remained till the ferment at Athens ſubſided. Under Euclid he ſtudied the art of reaſoning, and probably increaſed his fondneſs for diſputation. With a view of furniſhing himſelf with all the knowledge which the age in which he lived could ſupply, he travelled into every country which was likely to anſwer any uſeful purpoſe to him in this reſpect. In that part of Italy called Magna Græcia, there was a celebrated ſchool eſtabliſhed by Pythagoras, and here he was inſtructed in the myſteries of the Pythagorean ſyſtem, the ſubtleties of which he afterwards too freely blended with the ſimple doctrine of Socrates. He next viſited Theodorus of Cyrene, in order to be inſtructed in mathematical ſcience; and he then determined to ſtudy aſtronomy, and other ſciences, in Egypt. Under the diſguiſe of a merchant, and ſeller of oil, he traverſed the whole kingdom of Artaxerxes Mnemon, deriving information from the Egyptian prieſts concerning their aſtronomical obſervations and calculations. In Egypt, it is ſaid, he acquired his opinions concerning the origin of the world, and learned the doctrines of the tranſmigration and immortality of the ſoul; but it is more probable, that he learned the latter doctrine from Socrates, and the former from Pythagoras. All things conſidered, it is not very likely that Plato derived his ſyſtem of philoſophy from the Egyptians; nor is it more probable, that during his reſidence in Egypt, Plato became acquainted with the doctrine of the Hebrews, and enriched his ſyſtem with ſpoils from their ſacred books.

The Platonic philoſophy appears, in many reſpects, very conſiſtent with the Moſaic; and a great party of the primitive fathers follow the opinions of that philoſopher, as being favourable to Chriſtianity. Juſtin is of opinion, that Plato could not learn many things which he has ſaid in his works, from mere natural reaſon; but thinks he might have learnt them from the books of Moſes, which he might have read when in Egypt.

Hence Numenius the Pythagorean expreſsly calls Plato the *Attic Moſes*, and upbraids him with plagiariſm; becauſe he ſtole his doctrine about the world and God from the books of Moſes.

Theodoret ſays expreſsly that he has nothing good and commendable about the Deity and his worſhip, but what he ſtole from the Hebrew theology; and Clemens Alexandrinus calls him the *Hebrew philoſopher*.

Gale is very particular in his proof of the point, that Plato borrowed his philoſophy from the ſcriptures, either immediately, or by means of tradition; and, beſide the authority of the ancient writers, he brings ſome arguments from the thing itſelf. As, *e. gr.* Plato's confeſſion, that the Greeks borrowed their knowledge of the one infinite God from an ancient people, better and nearer to God than they; by which people, our author makes no doubt, he meant the Jews, from his account of the ſtate of innocence; as, that man was born of the earth, that he was naked, that he enjoyed a truly happy ſtate, that he converſed with brutes, &c. In effect, from an examen of all the parts of Plato's philoſophy, phyſical, metaphyſical, and ethical, this author finds, in every one, evident characters of its ſacred original.

St. Auguſtine commends the Platonic philoſophy; and even ſays, that the Platoniſts were not far from Chriſtianity. He adds, that the generality of the new Platoniſts of his time embraced the faith; and he expreſsly acknowledges, that

that it was by means of the Platonic ſyſtem he was able to underſtand the doctrine of the Trinity.

Juſtin Martyr profeſſes, that Plato's doctrine was of the utmoſt advantage to him, in helping him to believe the myſteries of the Chriſtian faith. To which it may be added, that it was, in good meaſure, by Plato's help, that Origen confuted Celſus.

Indeed, the late author of "Platoniſme Devoilé" carries things to an extravagant length, when he contends, that the dogmata of our religion are only the opinions of Plato; that the fathers give us nothing of the myſteries thereof, but what they learnt from him; and that Chriſtianity is only Platoniſm veiled, or covered over. To which opinion, however, M. le Clerc ſeems alſo a little inclined.

The opinion, that Plato borrowed the dogmata of his philoſophy from the ſcriptures, which has been ſtrenuouſly maintained by ſeveral Jewiſh and Chriſtian writers, has, however, as others maintain, little foundation beſides mere conjecture; and it is ſuppoſed to have originated in that injudicious zeal for the honour of revelation, which led theſe writers to make the Hebrew ſcriptures, or traditions, the ſource of all gentile wiſdom.

The chief grounds upon which the above-mentioned opinion reſts are the following: 1. The authority of the Jewiſh writers, Joſephus and Ariſtobulus, and of the Chriſtian fathers, Juſtin Martyr, Clemens Alexandrinus, Euſebius, Cyril of Alexandria, Theodoret, Ambroſe, and others. 2. The opinion that a Greek verſion of the Hebrew ſcriptures appeared in Egypt before the time of Plato, which he might have ſeen and read, as Clemens Alexandrinus and Euſebius, on the teſtimony of Ariſtobulus, aſſert. 3. The preſumption, that the Egyptians borrowed many of their tenets from the Iſraelites, and communicated them to Plato. And, 4. The agreement of the doctrines of Plato with thoſe of the Hebrews. But to theſe arguments it has been replied, 1. That the teſtimony of the Chriſtian fathers is, with regard to the preſent queſtion, of little value; as they had recourſe to no authentic memorials or impartial witneſſes, but credited the aſſertions of certain Jewiſh writers, who, ſeveral centuries after the time of Plato, with a view of gratifying their own vanity, and that of their countrymen, pretended that all gentile wiſdom had been originally derived from Moſes; and particularly, that Plato, during his reſidence in Egypt, had been inſtructed in the Hebrew ſchool. This notion was eagerly adopted by ſeveral learned Platoniſts, who in the ſecond century were converted to Chriſtianity, but ſtill retained an attachment to their former maſter; and from this time it became a common practice among thoſe who affected the credit of Greek erudition, to maintain, that whatever opinions Plato and his followers held, ſimilar to the doctrines of revelation, had been borrowed either from the Hebrews or Chriſtians. 2. A Greek verſion of the Hebrew ſcriptures, prior to the time of Alexander, never exiſted but in the brain of Ariſtobulus. 3. Equally unſupported is the aſſertion, that the Egyptians, and even Plato himſelf, converſed with the Jews on theological ſubjects. Laſtly, no proof of the point in queſtion can ariſe from the ſuppoſed agreement between the Moſaic and Platonic doctrines; for the agreement is either imaginary, or it conſiſts of ſuch particulars as might be eaſily diſcovered by the light of reaſon. Beſides, the true doctrine of Plato was ſo far adulterated and blended with other ſyſtems in the Alexandrian ſchool, that thoſe Chriſtian fathers who had ſtudied Platoniſm in this ſchool, might eaſily conceive that there was a greater harmony between the Platonic doctrine and their own creed than in reality exiſted.

Plato, after having availed himſelf of all the information which he could receive in diſtant countries, returned to the Pythagorean ſchool at Tarentum, in Italy, and here he attempted to improve his own ſyſtem by incorporating with it the doctrine of Pythagoras. In recounting the ſources of Plato's philoſophy, we may obſerve, that he borrowed his dialectics from Euclid of Megara; the principles of natural philoſophy he learned in the Eleatic ſchool, from Hermogenes and Cratylus; and combining theſe with the Pythagorean doctrine of natural cauſes, he framed from both his ſyſtem of metaphyſics. In mathematics and aſtronomy he was inſtructed in the Cyrenaic ſchool, and by the Egyptian prieſts. From Socrates he imbibed the pure principles of moral and political wiſdom, the ſimplicity of which he afterwards obſcured by Pythagorean ſpeculations. At length Plato, with his mind thus richly furniſhed, ſettled at Athens, and accompliſhed the deſign which he had long meditated, of forming a new ſchool for the inſtruction of youth in the principles of philoſophy. The place he choſe for this purpoſe was a public grove, called the *Academy;* which ſee. Here he eſtabliſhed his ſchool, and over the door of it, in order to indicate his reſpect for mathematical ſtudies, and how neceſſary a preparation he thought them for higher ſpeculations, he placed this inſcription, Ουδεὶς ἀγεωμέτρητος εἰσίτω: "Let no one, who is unacquainted with geometry, enter here." This ſchool became famous, and was crowded not only by young men from every quarter and of every diſtinction, but by females diſguiſed in men's clothes. Among the moſt illuſtrious of his followers we may reckon Dion, the Syracuſan prince, and the orators Hyperides, Lycurgus, Demoſthenes, and Iſocrates.

Such diſtinguiſhed reputation excited among the companions of Plato, formerly the diſciples of Socrates, a ſpirit of emulation, which degenerated into envy, and which terminated in detraction and obloquy. To this natural jealouſy it was owing, that Xenophon and Plato, though they relate the diſcourſes of their common maſter, ſtudiouſly avoid to mention one another. Diogenes the Cynic ridiculed Plato's doctrine of ideas, and other abſtract ſpeculations. Nevertheleſs, the fame of Plato increaſed, and his political wiſdom was held in ſuch high eſtimation, that ſeveral ſtates ſolicited his aſſiſtance in new-modelling their reſpective forms of government. The Arcadians and the Thebans applied to him for this purpoſe, but he rejected their applications, becauſe they refuſed to adopt the plan of his republic, which required an equal diſtribution of property. He gave his advice to ſeveral Grecian ſtates, and furniſhed a code of laws for Syracuſe. At three different periods he viſited the court of Dionyſius, tyrant of Sicily, and made ſeveral attempts to ſubdue his haughty and tyrannical ſpirit. The object of his firſt viſit to Sicily, in the fortieth year of his age, was to ſurvey the iſland, and to obſerve the wonderful phenomena of mount Ætna. During his reſidence at Syracuſe, he was employed in the inſtruction of Dion, the king's brother-in-law; and in his efforts to reſcue his pupil from the baneful influence of the general depravity, he was not diſappointed. Dion, inſpired with the love of wiſdom, was deſirous of introducing his preceptor to Dionyſius, the tyrant; but his diſcourſe with him being levelled againſt the vices and cruelties of his reign, the tyrant conceived a prejudice againſt Plato, and formed a deſign againſt his life, which by the aſſiſtance of Dion he eſcaped. Having engaged Pollis, a delegate from Sparta, to take charge of the philoſopher, and to land him ſafely in his own country, Dionyſius attempted to defeat his friendly purpoſe, and engaged Pollis either to put him to death, or to ſell him as a ſlave, in his paſſage. Accordingly, Pollis ſold him in the iſland of Ægina, the inhabitants of which were at war with the Athenians. Here he became acquainted with Anicerris, a Cyrenaic philoſopher, who teſtified his reſpect for Plato, by purchaſing his freedom for thirty minæ, and ſending him home to Athens; and when Plato's relations afterwards wiſhed to repay the money which Anicerris had advanced, he declined accepting it, alleging, with the genuine ſpirit which true philoſophy always inſpires, that he ſaw no reaſon why Plato's relations ſhould engroſs to themſelves the honour of ſerving him.

After much ſolicitation and deluſive promiſes on the part of Dionyſius, Plato took a ſecond journey to Syracuſe, where he was received by the king with ſingular reſpect, and ſacrifices were offered in congratulation of his arrival. It was not long, however, before Dion was baniſhed into Italy, and Plato was ſent back into his own country. Dionyſius again renewed his intreaties for the return of Plato to his court, who arrived a third time at Syracuſe, and for ſome time poſſeſſed the chief influence and authority there. But finding it impoſſible to prevail upon Dionyſius to adopt his ſyſtem of policy, or to recall Dion from his exile, a mutual diſtruſt aroſe between the tyrant and the philoſopher, and Plato, diſſatisfied with his ſituation, earneſtly requeſted permiſſion to return to Greece. After ſome delay permiſſion was granted, and a veſſel of convoy was provided; but the tyrant again changed his mind, and detained Plato in Syracuſe againſt his inclination. The tyrant's ſeeming reſpect was converted into rage, and the philoſopher was diſmiſſed from court, and committed to the cuſtody of ſoldiers. When his Pythagorean friends at Tarentum heard of his dangerous ſituation, they diſpatched an embaſſy to Dionyſius, demanding a fulfilment of his promiſes; and the tyrant, dreading the conſequences of a refuſal, and the diſgrace of having baniſhed from his court the firſt philoſopher of the age, gave Plato a magnificent entertainment, and ſent him away loaded with rich preſents.

Plato, reſtored to his country and his ſchool, devoted himſelf to ſcience, and ſpent the laſt years of a long life in the inſtruction of youth. Having enjoyed the advantage of an athletic conſtitution, and lived all his days temperately, he arrived at the 81ſt, or, according to ſome writers, the 79th year of his age, and died, through the mere decay of nature, in the firſt year of the 108th olympiad, B.C. 348.

He paſſed his whole life in a ſtate of celibacy, and as he had no natural heirs, he bequeathed all his effects by will to his friend Adiamantus. The grove and garden, which had been the ſcene of his philoſophical labours, at laſt afforded him a ſepulchre. Statues and altars were erected to his memory: the day of his death long continued to be celebrated as a feſtival by his followers; and his portrait is to this day preſerved in gems: but the moſt permanent monuments of his genius are his writings, which have been tranſmitted, without material injury, to the preſent times.

The character of Plato has been differently appreciated. Whilſt ſome have extolled him with the language of mere panegyric, as if he had been free even from human frailties, others have loaded his memory with unjuſt obloquy and reproach. Several anecdotes are preſerved which reflect honour on his moral principles and character. Such was his command of temper, that whilſt he was lifting up his hand to correct his ſervant for an offence, and perceiving himſelf angry, he kept his arm in that elevated poſture, and ſaid to a friend, who aſked him what he was about to do, "I am puniſhing a paſſionate man." At another time, he ſaid to one of his ſlaves, "I would chaſtiſe you if I were not angry." At the Olympic games he paſſed a day with ſome ſtrangers, who were delighted with his affable converſation, and who merely knew that his name was Plato. When they parted, he invited them, if they ſhould viſit Athens, to take up their reſidence at his houſe: they accepted his invitation, and were courteouſly entertained. During their ſtay, they expreſſed a wiſh to be introduced to his nameſake, the famous philoſopher, and to be ſhewn his academy. Plato, ſmiling, ſaid, "I am the perſon you wiſh to ſee." The diſcovery ſurprized them, nor could they eaſily perſuade themſelves, that a philoſopher, ſo eminent, would condeſcend to converſe ſo familiarly with ſtrangers. When he was informed that his enemies were induſtriouſly circulating reports to his diſadvantage, he ſaid, "I will live ſo, that none ſhall believe them." One of his friends remarking that he ſeemed no leſs deſirous to learn himſelf, than to teach others, aſked him, how long he intended to be a ſcholar? "As long," ſays he, "as I am not aſhamed to grow wiſer and better."

Of his merit as a philoſopher, we may form the moſt ſatisfactory judgment from his writings. As to his ſtyle, it retained that ſtrong tincture of a poetical ſpirit, which he diſcovered in his firſt productions. Hence have proceeded thoſe encomiums which ancient and modern critics have paſſed upon his language; and on this account it was held in high eſtimation by Cicero, who ſays, that "if Jupiter were to ſpeak in the Greek tongue, he would borrow the ſtyle of Plato." Ariſtotle deſcribes it as "a middle ſpecies of diction, between verſe and proſe." Moſt of his dialogues, independently of the copious and ſplendid diction that enriches them, are juſtly admired for their literary merit: the introductions are pertinent and amuſing; the courſe of the debate, or converſation, is clearly marked; the characters are accurately ſupported; every ſpeaker has his proper place, language, and manner; the ſcenery of the conference is painted in lively colours; and the whole is, with admirable art, adorned and enlivened by thoſe minute embelliſhments which render the colloquial mode of writing ſo peculiarly pleaſing. Even upon abſtract ſubjects, moral, metaphyſical or mathematical, the language of Plato is often clear as the running ſtream, and in ſimplicity and ſweetneſs vies with the humble violet which perfumes the vale. In theſe beautiful parts of his works, it has been conjectured, and not improbably, that Socrates and Lyſias were his models. At other times, his ſtyle is turgid and bombaſt, puerile or frigid, and his metaphors are harſh, and he is too fond of introducing new terms, with a bold and unwarrantable innovation. Faults of this kind have been noticed and cenſured by ſeveral ancient critics. His conceptions alſo have been charged with an inequality, ſimilar to that of his ſtyle. Whilſt he adheres to the ſchool of Socrates, and diſcourſes upon moral topics, he is much more pleaſing, than when he loſes himſelf with Pythagoras, in abſtruſe ſpeculations.

The Dialogues of Plato are claſſed by the ancients under the two heads of "didactic" and "inquiſitive." The former are divided into "ſpeculative," including *phyſical* and *logical*; and "practical," comprehending *ethical* and *political*. The latter, or "inquiſitive," are characteriſed by terms taken from the athletic art, and divided into the "gymnaſtic," and the "agoniſtic:" thoſe termed "gymnaſtic," ſuppoſed to be ſimilar to the *exerciſe*, were ſubdivided into the *majeutic*, as reſembling the teaching of the rudiments of the art, and the *piraſtic*, as repreſented by a ſkirmiſh, or trial of proficiency. The "agoniſtic" dialogues, ſuppoſed to reſemble the *combat*, were either *endeictic*, as exhibiting a ſpecimen of ſkill, or *anatreptic*, preſenting the ſpectacle of a perfect defeat. Inſtead of this whimſical claſſification, Plato's dialogues may not improperly be divided into *phyſical*, *logical*, *ethical*, and *political*.

The

The writings of Plato were originally collected by Hermodorus, one of his pupils: they confift of 35 dialogues, and 13 epiftles. They were firft publifhed, after the invention of printing, by Aldus Manutius, at Venice, in 1513. The editions of Ficinus and Serranus are the moft valuable; but the notes and interpretations fhould be read with caution; for Ficinus, having formed his conceptions of the doctrine of Plato after the model of the Alexandrian fchool, frequently, in his "Arguments," mifreprefents the defign of the author, and in his verfion obfcures the fenfe of the original; and Serranus, for want of an accurate acquaintance with the doctrine of his author, and under the influence of a ftrong predilection for the fcholaftic fyftem of theology, fometimes gives an incorrect and injudicious explanation of the text.

Availing ourfelves of the excellent work, which has furnifhed the materials of this article, we fhall now proceed to detail the philofophical fyftem of Plato, in order to which fome general obfervations fhould be premifed. Plato, difdaining the fober method of reafoning introduced by Socrates, left his firft mafter in fearch of other preceptors. Inclined to fpeculative refinement, and mifled by the celebrity of the Italian fchool, which abounded in fubtleties, he attached himfelf to the Pythagorean philofophy; and purfuing his ftudies under the Egyptian priefts, he deviated ftill farther from the plain path of common fenfe, which had been purfued in the Socratic fchool. Among other errors which he adopted from foreign philofophy, it was not the leaft that he borrowed the art of concealing his real opinions: and hence his writings became not only incidentally, but perhaps defignedly, obfcure. After the example of Pythagoras, he threw a veil of obfcurity over his public inftructions, which was removed only for the benefit of thofe who were admitted to his more private and confidential lectures. This concealed method of philofophifing he adopted partly from a regard to his perfonal fafety, and partly, if not principally, from motives of vanity. For this purpofe the colloquial form of inftruction, introduced by Socrates in his contefts with the Sophifts, and adopted in the Dialectic fchools, was found by Plato to be peculiarly convenient. Accordingly Cicero, though an enthufiaftic admirer of Plato, obferves, that "Plato affirms nothing, but after producing many arguments, and examining a queftion on every fide, leaves it undetermined." His language likewife, occafionally fplendid, and at other times ambiguous and equivocal, renders his meaning often doubtful and unintelligible: to which we may add, that the obfcurity of his writings is greatly increafed by the intermixture of mathematical ideas or language with thofe of metaphyfics. After all, the principal caufe of the want of perfpicuity that characterizes the writings of Plato is the extreme fubtlety of his fpeculations upon abftract and fublime topics. Raifing man above his condition and nature, Plato unites him to certain imaginary divine principles, leads him through various orders of emanation and forms of intelligence to the Supreme Being, and reprefents thefe fictions of fancy as the firft principles of wifdom. In fuch a wondrous maze of words does Plato involve his notions, that none of his difciples, not even the fagacious Stagirite, could unfold them; and yet we receive them as facred myfteries, and if we do not perfectly comprehend them, imagine that our intellects are too feeble to penetrate the conceptions of this divine philofopher, and that our eyes are blinded, as Burnet in his "Archæologia" expreffes it, by that refplendent blaze of truth, upon which his eagle fight could gaze without injury. Plato, indeed, ambitious of the honour of forming a new fect, and endued by nature with more brilliancy of fancy than ftrength of judgment, collected the tenets of other philofophers, which were, in many particulars, contradictory, and could by no exertion of ingenuity be brought to coalefce; and that, out of this heterogeneous mafs, he formed a confufed fyftem, deftitute of form or confiftency. This, it is faid, will be acknowledged by every one, who, in perufing the philofophical writings of Plato, is capable of divefting himfelf of that blind refpect for antiquity, by which the learned fo frequently fuffer themfelves to be mifled. In confirmation of this judgment, we need only refer to the dialogue entitled "Timæus;" a chaotic mafs of opinions, which no commentators have yet been able to reconcile, or to explain. The followers of Plato, inftead of arifing to difperfe the clouds that envelope his fyftem, feem to have combined in increafing its obfcurity. By fucceffive changes in the academy, after the death of its founder, new opinions were introduced, and thefe increafed the difficulty of exploring the true fenfe of Plato; and when, in a fubfequent period, the Platonic philofophy was profeffed in Alexandria, it was further adulterated by an injudicious and abfurd attempt to mould into one fyftem the doctrines of Plato, the traditionary tenets of Egypt and the eaftern nations, and the facred records of the Jews and Chriftians; a coalition which will appear, in the fequel of this article, to have proved exceedingly injurious both to philofophy and religion.

All the preceding circumftances confidered, it will appear to be no eafy tafk to delineate an accurate fketch of the Platonic philofophy. This philofophy, as he fuggefts, and his interpreters allow, may be divided into three branches: the firft treating of the art of reafoning, or dialectics; the fecond, of theoretical queftions concerning nature, or phyfics; and the third, of practical fubjects refpecting life and manners, or ethics.

Wifdom, in the ftrict Platonic fenfe of the term, is the knowledge of thofe things which truly exift, and are comprehended by the intellect, particularly thofe which refpect God, and the human foul as diftinct from the body. Philofophy is the defire of divine fcience, or the liberation of the mind from the body, and its direction towards thofe real effences, which are perceptible only by the underftanding: accordingly, a philofopher muft poffefs a mind naturally turned towards contemplation, an ardent love of truth, a penetrating judgment, and a retentive memory; and he muft alfo be inured to the exercife of temperance and fortitude, that nothing corporeal may divert him from the purfuit of wifdom. Philofophy, as employed in the contemplation of truth, is termed theoretical; and as converfant in the regulation of actions, it is practical. The former produces a contemplative life, in which the mind, occupied in meditations purely intellectual, acquires a refemblance to the divinity; the latter leads to an active life, and applies the principles of wifdom to the benefit of fociety. Befides the contemplation of truth and virtue, the philofopher will inquire into the right conduct of the underftanding, and the powers of fpeech in the purfuits of knowledge, or will ftudy the art of reafoning or difputation. The office of philofophy then is threefold, *dialectic*, *theoretical*, and *practical*.

For the fum of Plato's doctrine on *dialectics*, as collected from his dialogues, fee DIALECTICA. The *theoretical* philofophy is divided by Plato into three branches, *viz. theological*, *phyfical*, and *mathematical*.

On *theology*, the fundamental doctrine of Plato, as well as that of other ancient philofophers, is, that from nothing nothing can proceed. This univerfal axiom, applied not only to the infinite efficient, but to the material caufe, Plato,

Plato, in his "Timæus," lays down as the ground of his reaſoning concerning the origin of the world. In this dialogue, which comprehends his whole doctrine on the formation of the univerſe, matter is ſo manifeſtly ſpoken of as eternally co-exiſting with God, that this part of his doctrine could not have been miſtaken by ſo many learned and able writers, if they had not been deſirous of eſtabliſhing a coincidence of doctrine between the writings of Plato and of Moſes. On the other hand, it is obſerved by the learned Dr. Cudworth, that though ſome of the ancient fathers impute to Plato the opinion, that matter was an unmade ſelf-exiſtent being, there ſeems to be no ſufficient ground for their ſo doing; and Porphyry, Iamblichus, Proclus, and other Platoniſts, do not only profeſſedly oppoſe the ſame as falſe, but alſo as that which was diſſonant from Plato's principles. However, he acknowledges, that Plato did aſſert a plurality of gods, meaning animated or intellectual beings, or dæmons, ſuperior to men, to whom honour and worſhip are due, and applying the appellation to the ſun, moon, and ſtars, and alſo to the earth. Nevertheleſs he aſſerts, at the ſame time, that there was one ſupreme God, the ſelf-originated being, the maker of the heaven and earth, and of all thoſe other gods. He alſo maintains, that the Pſyche, or univerſal mundane ſoul, which is a ſelf-moving principle, and the immediate cauſe of all the motion which is in the world, was neither eternal nor ſelf-exiſtent, but made or produced by God in time; and above this ſelf-moving Pſyche, but ſubordinate to the Supreme Being, and derived by emanation from him, which he calls τὸ ἓν, and τ' ἀγαθὸν, *the good*, he ſuppoſes an immoveable Nous or intellect, which was properly the Demiurgus, or former of the world.

The firſt matter of which this body of the univerſe was formed, he obſerves, was a rude undigeſted heap, or chaos: now, adds he, the creation was a mixed production; and the world is the reſult of a combination of neceſſity and underſtanding, *i. e.* of matter, which he calls neceſſity, and the divine wiſdom; yet ſo that mind doth rule over neceſſity: and to this neceſſity he aſcribes the introduction and prevalence both of moral and natural evil; maintaining, however, that the evils reſulting from the neceſſity of imperfect beings are over-ruled by Mind or God for good.

The principles, or elements which Plato lays down are fire, air, water, and earth.

He ſuppoſes two heavens, the *empyrean*, which he takes to be of a fiery nature, and to be inhabited by angels, &c.; and the *ſtarry* heaven, which he teaches is not adamantine, or ſolid, but liquid and ſpirable.

Although Plato, in his "Timæus," as other writers argue, calls God "the parent of the univerſe;" and in his "Sophiſta," ſpeaks of him as "creating animate and inanimate beings, which did not before exiſt;" yet theſe expreſſions do not neceſſarily imply that no prior matter exiſted, from which theſe new beings were formed. Through the whole "Timæus," Plato ſuppoſes two eternal and independent cauſes of all things: one, that by which all things are made, which is God; the other, that from which all things are made, which is matter. He diſtinguiſhes between God, matter, and the univerſe; and ſuppoſes the architect of the world to have formed it out of a maſs of pre-exiſtent matter. According to Plato, matter is an eternal and infinite principle, originally of no form, yet capable of receiving any, and infinitely diviſible; but his notion of it is eſſentially different from that which ſuppoſes it to conſiſt of ſmall indiviſible particles; and, therefore, Plato is not to be ranked among the Atomic philoſophers. Plato alſo maintains, that there is in matter a neceſſary, but blind and refractory force; and that hence ariſes a propenſity in matter to diſorder and deformity, which is the cauſe of all the imperfection which appears in the works of God, and the origin of evil. See Evil.

The principle oppoſite to matter, in the ſyſtem of Plato, is God, an intelligent cauſe, the origin of all ſpiritual being, and the former of the material world; whoſe nature he thought it difficult to diſcover, and, when diſcovered, impoſſible to divulge. The exiſtence of God he inferred from the marks of intelligence, which appear in the form and arrangement of bodies in the viſible world; and from the unity of the material ſyſtem he concluded, that the mind by which it was formed muſt be one. God, according to Plato, is the ſupreme intelligence, incorporeal, without beginning, end, or change, and capable of being perceived only by the mind. Plato aſcribes to the Deity all thoſe qualities which modern philoſophers attribute to immaterial ſubſtance, and conceives him to be in his nature ſimple, uncircumſcribed in ſpace, the author of all regulated motion, and, in fine, poſſeſſed of intelligence in the higheſt perfection. Whatever were Plato's notions of the eſſence of Deity, he aſcribed to him wiſdom and power ſufficient for the formation and preſervation of the world, and ſuppoſed him poſſeſſed of goodneſs, which inclined him to deſire, and, as far as the refractory nature of matter would permit, to produce, the happineſs of the univerſe. This great being is diſtinguiſhed by the appellation Το Αγαθὸν, *the Good*. "God, that he might form a perfect world," ſays Plato, followed that eternal pattern, which remains immutable, and which can only be comprehended by reaſon." But this pattern, or archetype, he has explained ſo obſcurely, that his interpreters and followers have been led to adopt very different opinions concerning it. Some have inferred from various paſſages that occur in his writings, that the whole of Plato's doctrine, with reſpect to the formation of the world, amounts to nothing more than that the Deity employed his underſtanding or reaſon in planning and executing the ſyſtem of the univerſe; and, conſequently, that by ideas exiſting in the reaſon of God are only meant conceptions formed in the divine mind. But by ideas Plato appears to have meant ſomething much more myſterious; namely, patterns, or archetypes, ſubſiſting by themſelves, as real beings, ὄντως ὄντα, in the divine reaſon, as in their original and eternal region, and iſſuing thence to give form to ſenſible things, and to become objects of contemplation and ſcience to rational beings. It is the doctrine of the "Timæus," that ὁ λογισμὸς τοῦ θεοῦ, the reaſon of God, comprehends examples of all things, and that this reaſon is one of the primary cauſes of things. Plutarch ſays, that Plato ſuppoſes theſe principles God, matter, and idea. Juſtin Martyr, Pſeudo-Origen, and others, aſſert the ſame, Theſe ideas Plato defines to be the peculiar natures of things, or eſſences as ſuch; and aſſerts, that they always remain the ſame, without beginning or end. Plato, having been from his youth converſant with Cratylus, a diſciple of Heraclitus, and inſtructed in the doctrine of that ſchool, that all ſenſible things are variable, and cannot be proper objects of ſcience, reaſonably concluded, that if there be any ſuch thing as ſcience, there muſt exiſt, beſides ſenſible objects, certain permanent natures, perceptible only by the intellect. Such natures, divine in their origin, and eternal and immutable in their exiſtence, he admitted into his ſyſtem, and called them ideas. Theſe objects of contemplation and ſcience Plato ſeems to have found in the ſchool of Pythagoras, whoſe numbers agreed in many leading characters with the ideas of Plato, and were employed for the ſame purpoſes, namely, to furniſh objects of true ſcience, and to elevate the human mind

mind to a reſemblance to the divine. Plato compares the ſtate of the human mind, with reſpect to the material and the intellectual world, to that of a man, who, in a cave into which no light can enter but by a ſingle paſſage, views, upon a wall oppoſite to the entrance, the ſhadows of external objects, and miſtakes them for realities. See the article PERCEPTION.

It was another doctrine in the Platonic ſyſtem, that the deity formed the material world after a perfect archetype, which had eternally ſubſiſted in his reaſon, and endued it with a ſoul. This Plato ſuppoſed to be the animating principle in the univerſe, pervading and adorning all things. This third principle in nature is, in the Platonic ſyſtem, inferior to the Deity, being derived from that divine reaſon, which is the ſeat of the ideal world; thus eſſentially differing from the Stoical doctrine of the ſoul of the world, which ſuppoſed the eſſence of the divine nature diffuſed through the univerſe. The doctrine of a twofold ſoul of the world, the one υπερκοσμιον, preſiding over it, the other εγκοσμιον, reſiding in it, is an appendage to the ancient Platonic ſyſtem, introduced by the later Platoniſts, to accommodate this ſyſtem to the notions adopted by many of the Chriſtian fathers concerning the divine nature. But Plato's doctrine concerning God and the ſoul of the world differs materially from the doctrine of the Trinity, afterwards received in the Chriſtian church. Plato did not ſuppoſe three ſubſtances in one divine eſſence, ſeparate from the viſible world; but he taught, that the λογος, or reaſon of God, is the ſeat of the intelligible world, or of ideas, and that the ſoul of the world is a third ſubordinate nature, compounded of intelligence and matter. In the language of Plato, the univerſe, being animated by a ſoul which proceeds from God, is the ſon of God; and ſeveral parts of nature, particularly the heavenly bodies, are Gods. He probably conceived many ſubordinate divinities to have been produced at the ſame time with the ſoul of the world, and imagined that the Supreme Being appointed them to the charge of forming animal bodies, and ſuperintending the viſible world; a doctrine which he ſeems to have borrowed from the Pythagoreans, and particularly from Timæus the Locrian, who ſays, "the ruler of all aſſigned the inſpection of human affairs to dæmons, and committed to them the government of the world."

On the foundation of the doctrine, above explained, concerning God, matter, ideas, the ſoul of the world, and dæmons, Plato raiſed the ſtructure of his phyſics: thinking, that the ſupreme Architect, by uniting eternal and immutable ideas or forms to variable matter, produced the viſible world; and believing, that the world had a beginning in time, and not to have exiſted from eternity.

Other tenets included in the Platonic doctrine of nature were, that the univerſe is one animated being, including within its limits all animated natures; that fire and earth were firſt formed, and afterwards united by means of air and water; that from perfect parts one perfect whole was produced, of a ſpherical figure, as in itſelf moſt beautiful, and beſt adapted to contain all other figures; that the elementary parts of the world are of regular geometrical forms, the particles of earth being cubical, thoſe of fire pyramidical, thoſe of air in the form of an octahedron, and thoſe of water in that of an icoſahedron; that theſe are adjuſted, in number, meaſure, and power, in perfect conformity to the geometrical laws of proportion; that the ſoul which pervades this ſphere is the cauſe of its revolution round its centre; and, laſtly, that the world will remain for ever, but that, by the action of its animating principle, it accompliſhes certain periods, within which every thing returns to its ancient place and ſtate. This periodical revolution of nature is called the PLATONIC, or *Great, year*.

Plato's doctrine concerning the human ſoul, as an emanation from God, is treated obſcurely. This emanation was not immediate, but through the intervention of the ſoul of the world, debaſed by ſome material admixture; and conſequently the human ſoul, receding farther from the firſt intelligence, is inferior in perfection to the ſoul of the world. The human ſoul, in the material part of its nature, is formed for converſing with ſenſible objects, and, in its intellectual part, capable of ſpiritual contemplation; but what he meant by οχημα, the material vehicle of the ſoul, is uncertain. The relation which the human ſoul, in its original conſtitution, bears to matter, Plato appears to have conſidered as the ſource of moral evil. As to the manner in which the ſoul acts on the body, Plato ſpeaks obſcurely and inconſiſtently; but it is probable, that, as he conceived the ſoul of the world to produce the motion of the earth, and the heavenly bodies, by means of that part of its nature which is material; ſo he ſuppoſed the power of moving bodies, which belongs to the human ſoul, to be the effect of its material principles. With regard to the origin and preſent ſtate of human ſouls, Plato ſuppoſes, that when God formed the univerſe, he ſeparated from the ſoul of the world inferior ſouls, equal in number to the ſtars, and aſſigned to each its proper celeſtial abode; but that theſe ſouls, by ſome means, or for ſome reaſon or other not explained, were ſent down to the earth into human bodies, as into a ſepulchre or priſon; and to this cauſe he aſcribes the depravity and miſery to which human nature is liable; maintaining, at the ſame time, that by diſengaging itſelf from all animal paſſions, and riſing above ſenſible objects to the contemplation of the world of intelligence, the ſoul of man can be prepared to return to its original habitation. According to Plato, the ſoul conſiſts of three parts, *viz.* the ſeat of intelligence, that of paſſion, and that of appetite; and he aſſigns to each its proper place in the human body. The firſt of theſe portions or faculties of the ſoul, under both which denominations he ſpeaks of them, he conceived to have been derived from God; the ſecond and third from matter. Plato teaches, in expreſs terms, the doctrine of the immortality of the rational ſoul, reſting the proof of this doctrine, however, upon arguments drawn from the mere fanciful parts of his ſyſtem.

Plato was a zealous advocate for the importance of that kind of ſcience, which is purely ſpeculative, and though he has left no direct treatiſe on mathematics, he requires from his diſciples an acquaintance with the elements of this branch of knowledge, preparatory to the ſtudy of theoretical philoſophy. On the ſubjects of policy and morals he preſcribes rules, which are intended for the direction of ſocieties and individuals in the offices of life, but they are too much tinctured with his theoretical doctrines. The main object of his political inſtitutions, appears to have been the ſubjugation of the appetites and paſſions, by means of the abſtract contemplation of ideas. The chief heads of his moral doctrine are as follow: Our higheſt good conſiſts in the knowledge and contemplation of the firſt good, which is mind, or God. All thoſe things which are called good by men, are really ſuch only ſo far as they are derived from the firſt and higheſt good. The only power in human nature, which can acquire a reſemblance to the Supreme good, is reaſon. The minds of philoſophers are fraught with valuable treaſures; and, after the death of the body, they ſhall be admitted to divine entertainments; ſo that whilſt with the gods they are employed in ſurveying the fields of truth, they will look down with contempt on the folly of thoſe, who are contented

tented with earthly ſhadows. Goodneſs and beauty conſiſt in the knowledge of the firſt good, and the firſt fair. That only which is becoming is good; therefore virtue is to be preferred for its own ſake; and, becauſe it is a divine attainment, it cannot be taught, but it is the gift of God. He alone, who has attained the knowledge of the firſt good, is happy; the end of this knowledge is, to render man as like to God as the condition of human nature will permit. This likeneſs conſiſts in prudence, juſtice, ſanctity, temperance. In order to attain this ſtate, it is neceſſary to be convinced, that the body is a priſon, from which the ſoul muſt be releaſed, before it can arrive at the knowledge of thoſe things which are real and immutable. Virtue is the moſt perfect habit of mind which adorns the man, and renders him firm, reſolute, and conſiſtent, in action and ſpeech, in ſolitude and ſociety. The virtues are ſo nearly allied, that they cannot be ſeparated: they are perfect, and therefore neither capable of increaſe, nor of diminution. The paſſions are motions of the ſoul, excited by ſome apparent good or evil: they originate in the irrational parts of the ſoul, and muſt be regulated and ſubdued by reaſon. Friendſhip is, ſtrictly ſpeaking, reciprocal benevolence, which inclines each party to be as ſolicitous for the welfare of the other, as for his own. This equality of affection is created and preſerved by a ſimilarity of diſpoſition and manners. Upon the whole it may be obſerved, that whilſt the writings of Plato contain many juſt and ſublime ſentiments on moral ſubjects, his ethical doctrine, duly examined, will appear to be, in ſome particulars, defective, and in others extravagant and abſurd. The fanciful notions which he entertained concerning the divine nature, the world of ideas, and matter, ſeem to have given a romantic and enthuſiaſtic turn to his conceptions on morals; a defect, which may be in part aſcribed to his connection with the Pythagorean ſchool, but which was, perhaps, chiefly owing to the peculiar propenſity of his genius towards metaphyſical fiction.

After the death of Plato, two of his principal diſciples, Ariſtotle and Xenocrates, continuing his office, and teaching, the one in the ACADEMY, and the other in the LYCEUM, founded two ſects, under different names, though in other reſpects the ſame; the one retaining the denomination of ACADEMICS, the other aſſuming that of PERIPATETICS. The Academic ſect fell into general neglect under the Roman emperors; partly becauſe it was treated with contempt by the dogmatiſts, and partly on account of the reviving credit of the Sceptic ſect, in which the peculiar tenets of the Middle Academy were embraced. Neverthelefs, the true doctrine of Plato, which had formerly obtained ſuch high eſteem among philoſophers, and which had been lately reſtored at Athens by Antiochus, reſumed its honours. Among the genuine followers of Plato, we find, at this period, ſeveral illuſtrious names. Under the emperors Auguſtus and Tiberius, flouriſhed Thraſybulus, a Mendeſian, who, though an eminent Platoniſt, ſo far conformed to the practice of the Pythagoreans, as to become an adept in the art of aſtrology. Not long after his time lived Theon of Smyrna; to whoſe aſtronomical obſervations, Ptolemy the aſtronomer, who flouriſhed under Antoninus Pius, has referred, and whoſe mathematical treatiſes, elucidating the writings of Plato, prove that he belonged to the Platonic ſchool. At the ſame time, his diſcourſes in geometry, arithmetic, muſic, aſtronomy, and the harmony of the univerſe, ſerve to caſt ſome light upon the Pythagorean ſyſtem. Alcinous, whoſe age is uncertain, but commonly placed about the beginning of the ſecond century, wrote an introduction to Plato, containing a ſummary of his doctrine, which ſhews him to have been well acquainted with his philoſophy. Favorinus, a native of Arles, lived in the reigns of Trajan and Adrian, and was well inſtructed in the precepts of philoſophy by Epictetus, the illuſtrious ornament of the Stoical ſchool; but none of his writings are extant. Under the reign of Antoninus Pius flouriſhed Calviſius Taurus of Beryta, and he is mentioned as a Platoniſt of ſome note. He wrote ſeveral pieces, chiefly to illuſtrate the Platonic philoſophy; he lived at Athens, and taught, not in the ſchools, but at his table. Aulus Gellius was frequently one of his gueſts, and in his "Noctes Atticæ" has given an account of the manner in which theſe philoſophical entertainments were conducted. The ſame period produced Lucius Apuleius; ſee his article. Another Platoniſt, who flouriſhed under M. Aurelius Antoninus, was Atticus; chiefly memorable for the laudable pains with which he endeavoured to aſcertain the exact points of difference between the doctrines of Plato and Ariſtotle. (See ATTICUS.) Numenius of Apamea in Syria belonged to the ſame claſs of writers with Atticus; and Maximus Tyrius, though chiefly diſtinguiſhed by his eloquence, obtained ſome degree of celebrity as a philoſopher; and his elegant Diſſertations are for the moſt part written upon Platonic principles, though they ſometimes incline towards ſcepticiſm. Plutarch and Galen are alſo commonly ranked among the Platoniſts. See their reſpective articles.

In later times, about the firſt ages of the Chriſtian church, the followers of Plato abandoned the title of "Academics" or "Academiſts," and aſſumed that of "Platoniſts." It is ſuppoſed to have been at Alexandria, in Egypt, that they firſt aſſumed their new title, after having reſtored the ancient Academy, and re-eſtabliſhed Plato's ſentiments; many of which, in proceſs of time, had been laid aſide. Among the Greek Platoniſts, thoſe who acquired the greateſt reputation were Porphyry, Plotin, Iamblichus, Proclus, and Plutarch; and among the Latins, Apuleius and Chalcidius. Among the Hebrews, Philo Judæus occupied the chief rank. The modern Platoniſts were Plotin, the founder, at leaſt the reformer of their ſect.

It is certain, that moſt of the celebrated fathers were Platoniſts, and borrowed many of their explanations of ſcripture from the Platonic ſyſtem. In order to account for this fact, we may obſerve, that, towards the concluſion of the ſecond century, a new ſect of philoſophers, called the modern, or later Platonics, aroſe of a ſudden, ſpread with amazing rapidity through the greateſt part of the Roman empire, ſwallowed up almoſt all the other ſects, and proved extremely detrimental to Chriſtianity. The ſchool of Alexandria in Egypt, inſtituted by Ptolemy Philadelphus, renewed and reformed the Platonic philoſophy. The votaries of this ſyſtem diſtinguiſhed themſelves by the title of Platonics, becauſe they thought that the ſentiments of Plato, concerning that moſt noble part of philoſophy, which has the Deity and things inviſible for its objects, were much more rational and ſublime than thoſe of the other philoſophers. This new ſpecies of Platoniſm was embraced by ſuch of the Alexandrian Chriſtians as were deſirous to retain, with the profeſſion of the Goſpel, the title, the dignity, and the habit of philoſophers.

Thoſe Alexandrian philoſophers, who became converts to the Chriſtian faith, retained a ſtrong predilection for Platonic tenets, and the higheſt reverence for the name of Plato; and therefore they eaſily credited the report, that the doctrine of Plato concerning the divine nature had been derived from revelation; and hence they thought themſelves juſtified in attempting a coalition between Plato and Jeſus Chriſt. An union of Platonic and Chriſtian doctrines was unqueſ-

unquestionably attempted in the second century by Justin Martyr, Athenagoras, and Clemens Alexandrinus, in whose writings we frequently meet with Platonic sentiments and language; and it is not improbable, that this corruption took its rise at a still earlier period.

Ammonius Sacca was the principal founder of this new Platonic system, and was succeeded by his disciple Plotinus, as he was by Porphyry, the chief of those formed in his school. (See ECLECTICS.) From the time of Ammonius, who, in order to recommend his Eclectic system to the attention of Christians, accommodated his language to the opinions which were then received among them, until the sixth century, this was almost the only system of philosophy that was publicly taught at Alexandria. Origen, and other Christians who studied in his school, were so far duped by the artifice of Sacca, as to imagine that they discovered, in the system of the Platonists, traces of a pure doctrine concerning the divine nature, which, on the ground just mentioned, they thought themselves at liberty to incorporate into the Christian faith. Entering upon the office of Christian teachers, under the bias of a strong partiality for Plato and his doctrine, they tinctured the minds of their disciples with the same prejudice, and thus disseminated Platonic notions, as Christian truths; little aware, without doubt, how far this practice would corrupt the purity of the Christian faith, and how much confusion and dissension it would occasion in the Christian church.

The Platonic system of philosophy was brought into Greece by Plutarch, who renewed at Athens the celebrated Academy, from whence issued many illustrious philosophers. The general principles on which this sect was founded, however the partizans of it might differ with respect to particular opinions, was, that truth was to be pursued with the utmost liberty, and to be collected from all the different systems in which it lay dispersed. None, however, who were ambitious to be ranked among these new Platonists, called in question the main doctrines; those, for example, which regarded the existence of one God, the fountain of all things; the eternity of the world; the dependence of matter upon the Supreme Being; the nature of souls; the plurality of gods; the method of interpreting the popular superstitions, &c.

That the reader may be able to trace distinctly the introduction and progress of this new Platonic system in the Christian church, we shall divide the Christian fathers into two classes; namely, those who flourished before and those who flourished after the institution of the Eclectic sect. (See ECLECTICS.) The first class commences with Justin Martyr, and the second with Origen. Justin Martyr, (see JUSTIN MARTYR,) after his conversion, retained a strong attachment to the Platonic system, and applied his knowledge of this system to the illustration and defence of the Christian doctrine. Perceiving an agreement between Platonism and Christianity, he concluded that whatever was valuable in the former, had either been communicated to Plato by inspiration, from the Logos, or first emanation of the divine nature, or had been transmitted by tradition from Moses and the Hebrew prophets, and might therefore be justly claimed as belonging to divine revelation, and incorporated into the Christian creed. By the term Logos he understood, not the reasoning faculty of the human mind, but, after Plato, the emaning reason of the divine nature; and he conceived this divine reason to have inspired the Hebrew prophets, and to have been the Christ who appeared in the flesh. He moreover apprehended, that it had been participated not only by the Hebrew patriarchs, but by the more excellent Pagan philosophers; and consequently he regarded every tenet in the writings of the Heathens, which he could reconcile with the doctrine of Christ, as a portion of divine wisdom which Christians might justly appropriate to themselves. Having learned from Plato and his followers, in the schools of Alexandria, that the knowledge of God is alone to be gained by the contemplation of ideas, which have their primary seat in the divine Logos, and that the human mind, in consequence of its nature as proceeding from the soul of the world, is capable of contemplating those divine ideas by means of which it may ascend to the knowledge of God, Justin was necessarily led to conclude, that man can only arrive at divine science through the medium of the Logos. Hence, he referred all Christian knowledge to the perception of the divine reason inhabiting in man; and thus laid the foundation of an error, still retained by some Christian sects, that Christ, or the Word, is a substantial ray of divine light internally communicated to man. Justin also borrowed from Plato his notion of angels employed in the government of the elements, the earth, and the heavens, and many other tenets that are not to be found in the scriptures. The sentiments and language of Tatian, who, after his conversion from Heathenism to Christianity, became a disciple of Justin Martyr, perfectly agree with those of the Egyptian and Cabbalistic philosophy, and were probably derived from those sources. The whole tenour of his Apology concurs with what is known of his history to prove, that he was a Platonic Christian. See TATIAN.

Several things in the Apology of Theophilus of Antioch (see his article), discover his predilection for the Platonic system, and his inclination to adapt it to the Christian doctrine. We may also rank among the Platonizing fathers, Athenagoras. (See ATHENAGORAS.) Another writer of this period, *viz.* Irenæus, seems to have borrowed his ideas and language from the Alexandrian Platonists. About the beginning of the third century flourished Tertullian, who frequently makes use of Platonic notions and language; but none of the fathers of this period merit higher distinction than Clemens Alexandrinus; nor was any one of them led farther astray, by philosophical subtlety, from the simplicity of the Christian faith. We frequently find him adopting Platonic and Stoic tenets as Christian doctrines, and thus sowing the seeds of error in the Christian church. The most celebrated of the Christian fathers, after Ammonius, who, following the idea of Potamo, framed the Eclectic system, was Origen; and among other names which distinguish this period, the principal are Arnobius, Lactantius, Eusebius Pamphilus, Didymus of Alexandria, and Augustine. See their respective articles.

In the fourth century, under the reign of Valentinian, a dreadful storm of persecution arose against the Platonists; many of whom, being accused of magical practices, and other heinous crimes, were capitally convicted. In the fifth century Proclus gave new life to the doctrine of Plato, and restored it to its former credit in Greece; with whom concurred many of the Christian doctors, who adopted the Platonic system: among the more eminent of whom we may reckon Synesius, an African bishop. The Platonic philosophers were, in general, opposers of Christianity; but in the sixth century, Chalcidius, whose conversion to Christianity has been doubted, gave the Pagan system an evangelical aspect; and those who, before it became the religion of the state, ranged themselves under the standard of Plato, repaired to that of Christ, without any considerable change of their system. At the beginning of this sixth century appeared Boethius, who was born at Rome and sent to Athens to study philosophy. In the school of Proclus he became acquainted with the Eclectic system; and from the commendations

mendations which he beſtows upon Porphyry, as the beſt interpreter of Ariſtotle, he ſeems to have united the Platonic with the Ariſtotelian doctrine. Æneas Gaza, towards the cloſe of the fifth century, in a poem profeſſedly written againſt the Platoniſts, confounds the doctrines of Platoniſm and Chriſtianity. Under the emperor Juſtinian, who iſſued a particular edict, prohibiting the teaching of philoſophy at Athens, which edict ſeems to have been levelled at modern Platoniſm, all the celebrated philoſophers of this ſect took refuge among the Perſians, who were, at that time, the enemies of Rome; and though they returned from their voluntary exile when the peace was concluded between the Perſians and Romans, A.D. 533, they could never recover their former credit, nor obtain the direction of the public ſchools. Thus, ſays Moſheim, expired that famous ſect, which was diſtinguiſhed by the title of the modern or later Platoniſts, and which, for a ſeries of ages, had produced ſuch diviſions and tumults in the Chriſtian church, and which had been, in other reſpects, prejudicial to the intereſts and progreſs of the Goſpel. For a farther account of this ſect, ſee ECLECTICS.

The knowledge of Alexandrian Platoniſm was, however, revived in the Weſt by Joannes Scotus, who, in the ninth century, tranſlated the books aſcribed to Dionyſius the Areopagite, or St. Denys, and laid the foundation of the myſtical ſyſtem of theology, which afterwards ſo generally prevailed. Thus philoſophical enthuſiaſm, born in the Eaſt, nouriſhed by Plato, educated in Alexandria, matured in Aſia, and adopted into the Greek church, found its way, under the pretext and authority of an apoſtolic name, into the weſtern church, and there produced innumerable miſchiefs.

The firſt Greek who gave occaſion to the revival of Platoniſm in Italy, was Gemiſtius Pletho, a native of Conſtantinople, who was born in 1390, and lived 100 years. He was a zealous advocate for Platoniſm, and maintained a violent controverſy with the Ariſtotelians. In his "Expoſitio Oraculorum Magicorum Zoroaſtris," he exhibits twelve fundamental articles of the Platonic religion, and gives an elegant compendium of the whole Platonic philoſophy. A more moderate adherent to Plato, who maintained his ſyſtem without caſting contempt on the philoſophy of Ariſtotle, or treſpaſſing upon the doctrine of Chriſtianity, was Beſſario, a learned biſhop of Nice, who was appointed by the emperor Michael Palæologus, about the year 1440, together with other Greek divines, to treat with the Latin church concerning an union. He died at Ravenna in 1472. He wrote a defence of the Platonic ſyſtem againſt George of Trebizond. Under the patronage of Coſmo de Medici, Marſilius Ficinus, a Florentine, born in 1433, was educated by Pletho, for the expreſs purpoſe of tranſlating the writings of Plato. It appears, however, from the execution of the taſk aſſigned him, and his other writings, that he was deficient in ſtrength of judgment and correctneſs of taſte. His Latin ſtyle wants that richneſs and dignity which are requiſite in a verſion of Plato. A fellow labourer with Ficinus, in the taſk of editing and tranſlating the writings of Plato, was Joannes Picus of Mirandola, born in 1460; who, for his ſucceſs in reviving the Platonic philoſophy, was honoured with the title of the phœnix of his age. Picus was a zealous ſupporter of Platoniſm, after the model of the Alexandrian ſchool; but not without blending with its doctrine a large portion of Cabbaliſtic myſtery, and confounding with both theſe the doctrine of divine revelation. About this period, a body of Greek ſcholars avowed themſelves zealous advocates for the genuine Ariſtotelian philoſophy; and employed their time and learning in editing and tranſlating the writings of the Stagirite. The principal of thoſe who laboured in this undertaking were Theodore Gaza, George of Trebizond, and Georgius Scholarius. Between theſe philoſophers, on the one part, who followed Plato, and thoſe on the other who followed Ariſtotle, a diſpute aroſe concerning the merit and authority of their reſpective maſters, which was carried on to a moſt ridiculous and extravagant height. It was begun by Pletho, whoſe veneration for Plato led him to oppoſe with great violence the unrivalled dominion which Ariſtotle had for ages poſſeſſed in the ſchools. Georgius Scholarius, on the other hand, zealouſly defended Ariſtotle, and ſtrenuouſly maintained that his opinions are conſonant to the trueſt and beſt doctrines of the Chriſtian religion, and are *even more true;* and that the tenets of Plato, differing from thoſe of Ariſtotle, are *therefore* falſe. George of Trebizond ſupported Scholarius; and Pletho was ably ſeconded by Gaza. Other combatants alſo engaged in the conteſt, and in the proſecution of it expoſed themſelves to ridicule. The partiſans of the Platonic ſyſtem, who, under the patronage of the Medicean family, for a long time maintained their ground againſt the Ariſtotelians, declining with the fortune of their patrons, the advocates for the Peripatetic philoſophy proportionably increaſed, and after a violent ſtruggle, eſtabliſhed a victory.

The doctrines of the later Platoniſts having been revived by the Greek exiles in Italy, their farther ſpread is chiefly to be imputed to the averſion which many good men entertained againſt the Peripatetic philoſophy, on account of the ſhameful impieties to which it had given birth. Perceiving that they could not commit themſelves to the direction of Ariſtotle, without hazarding their religious principles; and not having ſtrength of mind ſufficient to form a ſyſtem of opinions for themſelves, they adopted the philoſophy of Plato in the corrupted ſtate in which it had been tranſmitted, through the Alexandrian and Chriſtian ſchools, to modern times. This philoſophy was the more readily embraced, becauſe it was believed, that the myſteries of Pythagoras, than which none appeared to approach nearer to thoſe of true religion, had been long ſince united with the wiſdom of Plato. In this ſchool they expected to find much divine inſtruction; more eſpecially as they were led to believe, that its doctrines had been, mediately or remotely, derived from divine revelation. And as one error generally produces another, theſe learned men united with this ſyſtem the ſecret or cabbaliſtic philoſophy of the Jews, which, for want of due examination, they conceived to have been the pure doctrine of the ancient Hebrews. Hence aroſe a new compound of tenets, ſufficiently myſterious and paradoxical, which was received by this claſs of philoſophers as the ſum of ancient wiſdom. Whilſt Ficinus was reviving the Platonic philoſophy in Italy, and Faber the Ariſtotelian in France, John Reuchlin, otherwiſe called Capnio, born at Pforzheim, in Suabia, in 1455, profeſſed and taught a myſtical ſyſtem, compounded of Platonic, Pythagoric, and Cabbaliſtic doctrines. George Venet, an obſcure and enthuſiaſtic writer, purſued a ſimilar courſe, and blended ſundry Peripatetic notions with the Platonic and Cabbaliſtic ſyſtems. The myſtic ſyſtem of Cabbaliſtic Platoniſm was ably ſupported by Henry Cornelius Agrippa. A very different mode of reſtoring the Platonic philoſophy was purſued by Franciſcus Patricius, born at Cliſſa, in Illyricum, in 1529. In the ſchools of Italy he profeſſed to unite the doctrines of Ariſtotle and Plato, but in reality undermined that of the former. Being appointed by pope Clement VIII. a preceptor in philoſophy at Rome, he openly diſcovered his averſion to the Ariſtotelian ſyſtem, and adviſed the pope to prohibit the teaching of this philoſophy in the ſchools, and to introduce the doctrine of Plato, as more consonant to the Christian faith. In the 17th century, Platonism found many advocates in Great Britain, owing, in a great measure, to the desire which many able and learned divines at this time entertained of refuting the tenets of Hobbes; and this they thought could not be more effectually done, than by reviving an attention to the doctrine of Plato, both in his own works, and in those of his followers. Of those who ranged themselves under the banners of Plato, the most celebrated are Gale, Cudworth, and More. Brucker's History of Philosophy, by Enfield, vol. i. and ii. Mosheim's Eccl. Hist.

PLATONISTS. See PLATONISM and ACADEMICS.

PLATONOPOLIS, in *Ancient Geography*, a city which Plotinus requested the emperor Galienus to build in Campania. This city had been formerly razed, and Plotinus used his interest with the emperor, not only to have it rebuilt, but to obtain a grant of the neighbouring territory, that it might be inhabited by a body of philosophers, and governed by the laws of Plato, under the name of Platonopolis. He promised, at the same time, that he and his friends would lay the foundation of this philosophical colony. The emperor was dissuaded by his friends from acceding to this proposal.

PLATOON, or PLOTTOON, formed, by corruption, of the French *peloton, a bottom*, or *clue, of thread*, in *War*, formerly denoted a small body of men, drawn out of a battalion of foot, and placed between the squadrons of horse, to sustain them; or in ambuscades, straits, and defiles, where there is not room for whole battalions or regiments.

Platoons were also used when they formed the hollow square, to strengthen the angles.

The grenadiers were generally posted in platoons.

A battalion was generally divided into sixteen platoons, exclusive of the grenadiers, which formed two or four platoons more, as occasion required. At present the battalion is generally divided into wings, grand divisions, divisions (or companies), subdivisions, and sections; and the word platoon is seldom used, except to denote a number (from 10 to 20) of recruits assembled for the purpose of instruction, in which case it may be considered as synonimous with company. See BATTALION.

PLATOON *Exercise*. See BATTALION.

PLATOON *Firing*. See BATTALION and FIRING.

PLATOON *Pivots*. See PIVOT.

PLATTE, or *Shallow River*, in *Geography*, a western branch of the river Missouri, remarkable for its quicksands and bad navigation. Near the confluence of this river with the Missouri, dwells the nation of the Octolactos, or Otos, consisting of about 200 warriors.

PLATTE, *La*, a smaller river of America, in the state of Vermont, which runs into lake Champlain, at Shelburn.

PLATTE *Forme, La*, a cape on the W. coast of St. Domingo. N. lat. 19° 36′. W. long. 74° 2′.—Also, a town on the S. side of the N. peninsula of St. Domingo; 13 leagues S.E. by S. of the Mole.

PLATTEN, a town of Bohemia, in the circle of Leitmeritz; 4 miles E. of Kamnitz.—Also, a town of Bohemia, in the circle of Elnbogen; 27 miles N.E. of Eger. N. lat. 50° 23′. E. long. 12° 45′.

PLATTENBURG, a citadel of Brandenburg, in the Mark of Pregnitz; 4 miles E. of Wilsnach.

PLATTS, a small island in the Indian sea. S. lat. 5° 55′. E. long. 55° 20′.

PLATTS, on board a *Ship*. See PLATS.

PLATTSBURG, in *Geography*, a post-town of America, in Clinton county, New York, on lake Champlain; 5 miles W. of Ticonderoga. N. lat. 44° 41′. W. long. 73° 27′. Here are a house for public worship, a court-house, and a gaol. The court of common pleas and grand sessions of the peace sit here twice a-year; and in the town are artizans of almost every kind, who furnish among themselves all the materials for building, glass excepted. Here also be found polite circles. The number of inhabitants is 1409.

PLATUNIUM, in *Botany*, from πλατυνω, *to dilate* or *enlarge*, in allusion to its large spreading calyx; a genus described by Jussieu, in the Annales du Musée, v. 7. 65, with which we are unacquainted. *De Théis*. 371.

PLATYCEROS OVIS, in *Zoology*, the name given by Gesner and some others to a species of sheep, commonly called *ovis laticauda*, or the broad-tailed sheep. See OVIS.

PLATYCEROS is also a name given by Pliny to the CERVUS *Dama*, or fallow deer.

PLATYCEROS, in *Entomology*, a species of *Lucanus*. See LUCANUS *Alces*, and LUCANUS *parallelepipedus*. See also TENEBRIO *Caraboides*.

PLATYLOBIUM, in *Botany*, so named, by the writer of the present article, from πλατυς, *broad*, and λοβος, *a pod* or *legume*; because of the breadth of that part, which is further augmented by a dilatation, or wing, running along the back.—Sm. Tr. of Linn. Soc. v. 2. 350. v. 9. 302. Bot. of New Holl. 17. Willd. Sp. Pl. v. 3. 921. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 4. 266.—Class and order, *Diadelphia Decandria*. Nat. Ord. *Papilionaceæ*, Linn. *Leguminosæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, bell-shaped, two-lipped; the upper lip rounded, very large, divided half way down into two obovate segments; the under much smaller, in three equal, awl-shaped, straight segments. *Cor.* papilionaceous. Standard heart-shaped, large, ascending, twice as long as the upper lip of the calyx, with a shortish, linear, convex claw. Wings half the length of the standard, obovate, each with a plait, and prominent tooth, at the base on its lower side, and a narrow claw. Keel the length of the wings, of two obovate, concave, converging petals, each with a tooth on its upper edge at the base. *Stam.* Filaments ten, united into one set for about half their length, separate only at the upper edge, ascending; anthers simple, roundish. *Pist.* Germen on a short stalk, oblong, compressed; style recurved; stigma simple. *Peric.* Legume stalked, oblong, compressed, almost flat, of one cell, its upper edge dilated into a flat longitudinal wing, the valves membranous. *Seeds* several, oval, compressed, each on a curved white stalk, with a tumid appendage.

Eff. Ch. Calyx two-lipped; the upper lip cloven, rounded, very large. Stamens all connected. Legume stalked, compressed flat, membranous, winged at the back, of one cell, with many seeds.

1. P. *formosum*. Orange Flat-pea. Sm. Bot. of New Holl. 17. t. 6. Willd. n. 1. Ait. n. 1. Curt. Mag. t. 469. Venten. Malmais. t. 31.—Leaves ovate, somewhat heart-shaped. Germen all over hairy. Stalk of the legume shorter than the calyx. Bracteas silky.—Native of New South Wales, from whence specimens, drawings, and seeds, were early sent by Dr. White and others. It is rather difficult to raise and to preserve, but when in perfection proves a great ornament to the greenhouse from June to August. The *stem* is erect, but very slender, and rather weak, bushy, with numerous, opposite, spreading branches, all of reddish-brown, hairy and round. *Leaves* opposite, on short stalks, acute, entire, convex, rigid, smooth, about an inch long; glaucous beneath. *Stipulas* in pairs, lanceolate, membranous, brownish. *Flowers* numerous, inodorous, large, on shortish, simple, axillary, crowded *stalks*, with a pair of *bracteas* under the

the *calyx*, which like them is silky. *Standard* and *wings* of an orange yellow, the former crimson at the back, as well as at the centre in front; wings pale, tipped with crimson. *Legume* an inch and a half long, and half as broad, obtuse, with a little sharp point, somewhat hairy all over.

2. P. *parviflorum.* Small-flowered Flat-pea. Sm. Bot. of N. Holl. 18. Willd. n. 2. Ait. n. 2. Curt. Mag. t. 1520.—Leaves lanceolate-ovate. Germen nearly smooth. Stalk of the legume longer than the calyx. Bracteas smooth.—From the same country. Sent to Kew by sir J. Banks in 1792. It blooms in the summer, amongst other greenhouse shrubs.

3. P. *triangulare.* Triangular-leaved Flat-pea. Brown MSS. Ait. n. 3. Curt. Mag. t. 1508.—"Leaves somewhat triangular or hastate, with spinous angles. Flower-stalks bracteated at the base and summit, naked in the middle. Legume several times longer than the calyx."—Gathered by Mr. Brown in Van Diemen's island, and sent to Kew in 1805. It is kept in the greenhouse, and flowers from June to September.

PLATYOPHTHALMON, a name given by some to antimony, from its use among the ladies of old time, to make their eye-brows broad and black.

PLATYPUS, *Duck-billed Platypus*, in *Zoology*, a genus of the class and order Mammalia Bruta, of which the generic character is; mouth shaped like the bill of a duck; the feet are palmate. There is but a single

Species.

ANATINUS. This extraordinary animal is placed by Dr. Shaw next to the genus Myrmecophaga. The description of this naturalist, who has taken much pains in investigating the characters of the genus, we shall transcribe, as being the only satisfactory account we have of it. "Of all the mammalia yet known, it seems the most extraordinary in its conformation, exhibiting the perfect resemblance of the beak of a duck engrafted on the head of a quadruped. So accurate is the similitude, that, at first view, it naturally excites the idea of some deceptive preparation by artificial means; the very epidermis, proportion, serratures, manner of opening, and other particulars of the beak of a shoveler, or other broad-billed species of duck, presenting themselves to the view: nor is it without the most minute and rigid examination that we can persuade ourselves of its being the real beak or snout of a quadruped.

"The body is depressed, and has some resemblance to that of an otter in miniature: it is covered with a very thick, soft, and beaver-like fur, and is of a moderately dark brown above, and of a subferruginous white beneath. The head is flattish, and rather small than large; the mouth or snout, as before observed, so exactly resembles that of some broad-billed species of duck, that it might be mistaken for such: round the base is a flat circular membrane, somewhat deeper or wider below than above, *viz.* below near the fifth of an inch, and above about an eighth. The tail is flat, furry like the body, rather short and obtuse, with an almost bifid termination; it is broader at the base, and gradually lessens to the tip, and is about three inches in length; its colour is similar to that of the body. The length of the whole animal, from the tip of the beak to that of the tail, is thirteen inches; of the beak an inch and a half. The legs are very short, terminating in a broad web, which on the fore feet extends to a considerable distance beyond the claws; but on the hind feet reaches no farther than the roots of the claws. On the fore feet are five claws, straight, strong, and sharp-pointed; the two exterior ones somewhat shorter than the three middle ones. On the hind feet are six claws, longer and more inclining to a curved form than those on the fore feet; the exterior toe and claw are considerably shorter than the four middle ones; the interior, or sixth, is seated much higher up than the rest, and resembles a strong, sharp spur. All the legs are hairy above; the fore feet are naked both above and below; but the hind feet are hairy above and naked below. The internal edges of the under mandible (which is narrower than the upper) are serrated or channelled with numerous striæ, as in a duck's bill. The nostrils are small and round, and are situated about a quarter of an inch from the tip of the bill, and are about the eighth of an inch distant from each other. There is no appearance of teeth; the palate is removed, but seems to have resembled that of a duck; the tongue also is wanting in the specimen. The ears or auditory foramina are placed about an inch beyond the eyes; they appear like a pair of oval holes of the eighth of an inch in diameter, there being no external ear. On the upper part of the head, on each side, a little beyond the beak, are situated two smallish oval white spots, in the lower part of each of which are imbedded the eyes, or at least the parts allotted to the animal for some kind of vision; for from the thickness of the fur, and the smallness of the organs, they seem to have been but obscurely calculated for distinct vision, and are probably like those of moles, and some other animals of that tribe; or perhaps even subcutaneous; the whole apparent diameter of the cavity in which they were placed not exceeding the tenth of an inch. When we consider the general form of this animal, and particularly its bill and webbed feet, we shall readily perceive that i tmust be a resident in watery situations; that it has the habits of digging or burrowing in the banks of rivers, or under ground; and that its food consists of aquatics, plants, and animals. This is all that can at present be reasonably guessed at: future observations, made in its native regions, will, it is hoped, afford us more ample information, and will make us fully acquainted with the natural history of an animal which differs so widely from all other quadrupeds, and which verifies, in a most striking manner, the observations of Buffon, *viz.* that whatever was possible for nature to produce, has actually been produced."

Dr. Shaw observes, in a subsequent volume, as the result of more accurate experiments, that "on laying open the parts beyond the base of the bill, it appears that the platypus, like the ant-eaters, is furnished with small bony processes resembling grinding-teeth, imbedded in the gum, but not fastened or rooted in the jaw: of these processes, there are two on each side both of the upper and under jaw." Shaw's Gen. Zool. vol. i. and ii.

PLATYRYNCHOS, in *Ichthyology*, a name given by some to the nasus, or nase, a fresh-water fish, caught in the Danube, and most of the large rivers in Germany, and much resembling the chub. See CYPRINUS *Nasus*.

PLATYSMA MYOIDES, in *Anatomy*, the thin stratum of muscular fibres placed immediately under the skin in the neck. It is described in the article DEGLUTITION, under the name of latissimus colli.

PLATYSTERNOS, a word used by the old physicians to express a person with a very broad chest or sternum.

PLATYZOMA, in *Botany*, from πλατυς, *broad*, and ζωμα, *a belt*, a genus of *Filices* in Mr. Brown's Prod. Nov. Holl. v. 1. 160, nearly allied to *Gleichenia*, from which the author says he was induced to separate it, rather on account of its undivided stalks, which in *Gleichenia* are forked, than for the slight difference in the fructification. The latter seems principally to consist in the revolute margins of the leaflets forming a sort of *involucrum*.

The

The only ſpecies mentioned is

1. P. *microphyllum.*—Found in the tropical parts of New Holland. A ſmooth fern, with a creeping ſcaly *root. Stalks* undivided. *Fronds* pinnate; leaflets extremely numerous, diſtinct, orbicular, entire, minute, covered beneath with ſulphur-coloured powder. *Capſules* few together in each dot. *Seeds* rather large. Some *fronds*, from the ſame root, are compreſſed, nearly thread-ſhaped, and undivided. See GLEICHENIA.

PLATZ, in *Geography*, a town of Bohemia, in the circle of Bechin; ſeven miles W. of Fiſtritz.

PLAU, or PLAUEN, a town of the duchy of Mecklenburg, on a lake called the "Plauer See;" 15 miles E. of Parchim. N. lat. 53° 50′. E. long. 12° 23′.

PLAVA, a town of Servia; 20 miles S.W. of Jenibaſar.

PLAUEN, a town of Saxony, in the county of Schwartzburg, on the Gera; 16 miles N.W. of Schwartzburg. N. lat. 50° 45′. E. long. 11° 2′.—Alſo, a town of Saxony, in the Vogtland, on the Elſter, in which is a manufacture of cotton and cloth; 22 miles S.W. of Zwickau. N. lat. 50° 23′. E. long. 12° 8′.—Alſo, a town of Brandenburg, in the Middle Mark, ſeated on a lake formed by the Havel, which gives name to a canal that runs from thence to the Elbe. This town has a manufacture of porcelain; ſix miles W. of Brandenburg. N. lat. 52° 29′. E. long. 12° 30′.

PLAUER SEE, a lake of the duchy of Mecklenburg, about 20 miles in circumference; E. of Plau.

PLAUSCHNITZ, a town of Bohemia, in the circle of Boleſlaw; three miles E.S.E. of Turnau.

PLAUSEN, a town of Pruſſia, in Ermeland; 14 miles E. of Heilſberg.

PLAUSUS, among the Romans. See ACCLAMATION.

PLAUTEN, in *Geography*, a town of Pruſſia, in Oberland; 16 miles S.E. of Marienwerder.

PLAUTUS, MARCUS ACCIUS, in *Biography*, a celebrated Latin writer of comedy, was a native of Sarſina, a ſmall town in Umbria. He was thought not only to have been of mean parentage, but the ſon of a ſlave. Few facts have come down to us that at all illuſtrate his life. He came to Rome, and obtained not only fame but emolument from his dramatic compoſitions, which were repreſented about a century and a half before the Chriſtian era. Plautus is ſaid to have acquired conſiderable property, and to have been tempted, in order to increaſe it, to engage in trade, but that, like many other literary ſpeculators, he ſucceeded ſo ill, that he was reduced to ſo great poverty, as to hire himſelf as a labourer to grind in a mill. Yet even in this toilſome ſituation his mind remained undepreſſed, and he compoſed three comedies. He died in the year 184 B.C. Anciently a great number of comedies were current under the popular name of Plautus, but of theſe the greater number was merely retouched by him, and the beſt Roman critics admitted only about twenty-five of his genuine compoſitions. Twenty of theſe are ſtill extant, but ſome of them are in a mutilated ſtate. Of the character they bore among his countrymen we have the moſt decided teſtimony. The learned Varro ſaid, if the Muſes were to ſpeak Latin, they would uſe no other ſtyle than that of Plautus. By Cicero the wit of Plautus is called elegant, refined, ingenious, and facetious. "To a modern reader," ſays an able critic, "the humour of Plautus will often appear ſtrong and genuine, but coarſe and indelicate, and intermixed with quibbles and witticiſms. His plays are, however, lively, and generally entertaining, and the language is a rich treaſury of the Latin tongue. Many of his pieces, like thoſe of the other dramatiſts, are profeſſed tranſlations from the Greek, and it is probable that all his plots are borrowed from the Grecian theatre." The beſt editions of Plautus are the Variorum by Gronovius.

PLAUZAT, in *Geography*, a town of France, in the department of the Puy de Dôme; 10 miles S. of Clermont Ferrand.

PLAY, LUSUS. See GAME, and GAMING.

PLAY, in the *Doctrine of Chances*, is uſed for the probability of the play's ending in a given number of games.

PLAY, in *Poetry*, &c. See DRAMA, TRAGEDY, COMEDY, &c.

PLAYFORD, JOHN, in *Biography*, a ſtationer and muſician, ſeller of muſical books and inſtruments, and clerk of the Temple church.

In 1655 he publiſhed the firſt edition of his "Introduction to the Skill of Muſic," a compendium compiled from Morley, Butler, and other more bulky and abſtruſe books, which had ſo rapid a ſale, that, in 1683, ten editions of it had been circulated through the kingdom. The book, indeed, contained no late diſcoveries or new doctrines, either in the theory or practice of the art; yet the form, price, and ſtyle, were ſo ſuited to every kind of muſical readers, that it ſeems to have been more generally purchaſed and read, than any elementary muſical tract that ever appeared in this or in any other country.

John Playford was born in the year 1613, and ſeems, by what means is now not known, to have laid in a conſiderable ſtock of muſical knowledge, previous to becoming the vender of the chief productions of the principal compoſers of the time. As he was the firſt, ſo he ſeems the moſt intelligent printer of muſic during the ſeventeenth century; and he and his ſon Henry appear to have acquired the eſteem of the firſt maſters of the art; and without a ſpecial licence, or authorized monopoly, to have had almoſt the whole buſineſs of furniſhing the entire nation with muſical inſtruments, muſic books, and muſic paper, to themſelves; as, during more than the firſt fifty years of the laſt century, Walſh and his ſon had afterwards.

In 1655, this diligent editor alſo publiſhed, in two ſeparate books, ſmall 8vo. "Court Ayres, by Dr. Charles Colman, William Lawes, John Jenkins, Simpſon, Child, Cook, Rogers, &c."

Theſe being publiſhed at a time when there was properly no court, were probably tunes which had been uſed in the maſques performed at Whitehall during the life of the late king.

It was honeſt John Playford who new ſtrung the harp of David, and publiſhed, in 1671, the firſt edition of his "Pſalms and Hymns in ſolemn Muſick, in foure Parts on the common Tunes to Pſalms in Metre uſed in Pariſh-churches. Alſo ſix Hymns for one Voice to the Organ," folio. The ſeveral editions of this work publiſhed in various forms, at a ſmall price, rendered its ſale very general, and pſalm-ſinging in parts, a favourite amuſement in almoſt every village in the kingdom.

PLAYFORD, HENRY, the ſecond ſon of John, ſucceeded his father as a muſic ſeller, at firſt at his ſhop in the Temple, but afterwards in the Temple Exchange, Fleet-ſtreet.

The muſic books advertiſed by him were but few compared with thoſe publiſhed by his father. Among them were the Orpheus Britannicus, and the ten ſonatas and airs of Purcell.

Henry Playford publiſhed, in 1701, what he called the ſecond book of the "Pleaſant Muſical Companion, being a choice collection of catches for three or four voices; publiſhed chiefly for the encouragement of the muſical ſocieties which

which will be ſpeedily ſet up in the chief cities and towns of England."

We know not what effect this advertiſing title-page had upon the nation, but believe that the publication of Purcell's catches in two ſmall volumes of the elder Walſh in queen Anne's time, was the means of eſtabliſhing catch clubs in almoſt every town in the kingdom, where tobacco, ale, and pſalm-ſinging were to be found.

It is conjectured that Henry Playford ſurvived his father but a ſhort time, for we meet with no publication by him after 1710.

PLAY-HOUSE. See THEATRE, AMPHITHEATRE, &c.

The moſt ancient Engliſh play-houſes were the Curtain in Shoreditch, and the Theatre. In the time of Shakſpeare, who commenced a dramatic writer about the year 1592, there were no leſs than ten theatres open, four private houſes, and ſix that were called public theatres. Moſt, if not all of Shakſpeare's plays, were performed either at the Globe, which was an hexagonal building, partly open to the weather, and partly covered with reeds, on the ſouthern ſide of the river Thames, called the Bank-ſide, and a public theatre, where they always acted by day-light; or at the theatre in Black-friars, which was a private play-houſe, and where plays were uſually repreſented by candle-light. Both theſe belonged to the ſame company of comedians, *viz.* his majeſty's ſervants, which title they aſſumed after a licence had been granted to them by king James, in 1603; having before this time been called the ſervants of the lord chamberlain. The exhibitions at the Globe ſeem to have been calculated chiefly for the lower claſs of people, and thoſe at Black-friars for a more ſelect and judicious audience. The former was a ſummer, and the latter a winter theatre. Many of our ancient dramatic pieces were performed in the yards of carriers' inns, in which, in the beginning of queen Elizabeth's reign, the comedians, who then firſt united themſelves in companies, erected an occaſional ſtage. The form of theſe temporary play-houſes ſeems to be preſerved in our modern theatres. Many circumſtances concur to render it probable, that our ancient theatres, in general, were only furniſhed with curtains, which opened in the middle, and a ſingle ſcene compoſed of tapeſtry, ſometimes ornamented with pictures. In the year 1605, Inigo Jones exhibited an entertainment at Oxford, in which moveable ſcenes were uſed; but they were not then uſed in the public theatres. When ſir William Davenant firſt opened, by virtue of his patent, the duke of York's theatre in Lincoln's-inn-fields, in the ſpring of the year 1662, with one of his own plays, the Siege of Rhodes, then ſcenes made their firſt appearance upon the Engliſh ſtage; and about the ſame time actreſſes were alſo introduced, probably by him, in imitation of the foreign theatres; and Mrs. Betterton is ſaid to have been the firſt woman that appeared on the Engliſh ſtage. Before this time, female characters were repreſented by boys or young men. In the time of Shakſpeare plays began at one o'clock in the afternoon, and the exhibition was uſually finiſhed in two hours; and ſo late as 1667, they commenced at three o'clock. See Malone's Supplemental Obſervations to Stevens's edition of Shakſpeare.

If any perſons ſhall in plays, &c. jeſtingly or prophanely uſe the name of God, they ſhall forfeit 10*l.* (Stat. 1 Jac. I. cap. 21.) And players ſpeaking any thing in derogation of religion, &c. are liable to forfeitures and impriſonment. (1 Eliz.) Alſo acting plays or interludes on a Sunday is ſubject to penalties, by 1 Car. I. cap. 1. No perſon ſhall act any new play, or an addition to an old one, &c. unleſs a true copy thereof, ſigned by the maſter of the play-houſe, be ſent to the lord chamberlain fourteen days before it be acted, who may prohibit the repreſenting any ſtage play; and perſons acting contrary to ſuch prohibitions ſhall forfeit 50*l.* and their licences, &c. (Stat. 10 Geo. II. cap. 28.) And by this ſtatute, no licence is to be given to act plays, but in the city and liberties of Weſtminſter, or places of his majeſty's reſidence. Ibid.

PLAZIA, in *Botany*, a genus in the Flora Peruviana, p. 92, named after John Plaza, a Spaniſh botaniſt, mentioned reſpectfully by Cluſius. *De Théis.* 371.

PLEA, PLACITUM, in *Law*, that which either party allegeth for himſelf in court, in a cauſe then depending to be tried.

Pleas are either *of the crown*, or *common pleas.*

PLEAS *of the Crown* comprehend all crimes and miſdemeanors, in which the king, on behalf of the public, is the plaintiff. Such are treaſons, felonies, miſpriſions of either, and mayhem.

PLEAS, *Common*, include all civil actions depending between ſubject and ſubject. The former of theſe were the proper object of the juriſdiction of the court of king's bench; the latter of the court of common pleas.

PLEAS are of two ſorts; *viz. dilatory* pleas, and pleas *to the action.* For an account of dilatory pleas, ſee DILATORY.

Pleas *to the action*, are ſuch as diſpute the very cauſe of ſuit.

A plea to the action is to anſwer to the merits of the complaint; which is done either by confeſſing or denying it. (See CONFESSION *of action.*) To this head may be referred the practice of what is called a "ſet-off;" by which the defendant acknowledges the juſtice of the plaintiff's demand on the one hand; but on the other, ſets up a demand of his own to counterbalance that of the plaintiff, either in the whole or in part; as if the plaintiff ſues for ten pounds due on a note of hand, the defendant may ſet off nine pounds due to himſelf for merchandize ſold to the plaintiff, and in caſe he *pleads* ſuch ſet-off, muſt pay the remaining balance into court. This anſwers very nearly to the *compenſatio*, or *ſtoppage*, of the civil law (Ff. 16. 2. 1.), and depends on the ſtatutes 2 Geo. II. c. 22. and 8 Geo. II. c. 24. which enact, that where there are mutual debts between the plaintiff and defendant, one debt may be ſet againſt the other, and either pleaded in bar, or given in evidence upon the general iſſue at the trial; which ſhall operate as payment, and extinguiſh ſo much of the plaintiff's demand.

Pleas that totally deny the cauſe of complaint are either the *general*, or a *ſpecial* plea, in bar. The *general* iſſue, or general plea, traverſes, thwarts, and denies at once the whole declaration, without offering any ſpecial matter whereby to evade it. Thus, in debt on contract, it is, *nihil debet*, he owes nothing; in debt on bond, *non eſt factum*, it is not his deed; in action of the caſe upon a promiſe, *non aſſumpſit*, he hath not promiſed; in treſpaſs upon the caſe, *not guilty*; in covenant, *performance of covenants*, &c. In real actions, *nul tort*, no wrong done; *nul diſſeiſin*, no diſſeiſin; and in a writ of right, that the tenant has more right to hold than the demandant has to demand. Theſe pleas are called the general iſſue, becauſe they amount at once to an iſſue, or a fact affirmed on one ſide, and denied on the other. Formerly the general iſſue was ſeldom pleaded, except when the party meant wholly to deny the charge alleged againſt him. But when he meant to diſtinguiſh, deny, or palliate the charge, it was always uſual to ſet forth the particular facts in what is called a *ſpecial* plea; which was originally intended to apprize the court and the adverſe party of the nature and circumſtances of the defence, and to keep the law and

and the fact diftinct. And it is an invariable rule, that every defence which cannot be thus fpecially pleaded, may be given in evidence, upon the general iffue at the trial. Of late, on account of the chicane and delay that have attended fpecial pleading, the courts have, in fome inftances, and the legiflature in many more, permitted the general iffue to be pleaded, thus leaving every thing open, the fact, the law, and the equity of the cafe, and have allowed fpecial matter to be given in evidence at the trial.

Special pleas, *in bar* of the plaintiff's demand, are very various, according to the circumftances of the defendant's cafe. As, in real actions a general releafe, or a fine, both of which may deftroy and bar the plaintiff's title. Or, in perfonal actions, an accord, arbitration, conditions performed, nonage of the defendant, or fome other fact which precludes the plaintiff from his action. A *juftification* is likewife a fpecial plea in bar; as in actions of affault and battery, *fon affault demefne*, that it was the plaintiff's own original affault; in trefpafs, that the defendant did the thing complained of in right of fome office which warranted him fo to do; or, in an action of flander, that the plaintiff is really as bad a man as the defendant faid he was. A man may alfo plead the ftatutes of limitation in bar. (See *Statutes of* LIMITATION.) An eftoppel is likewife a fpecial plea in bar. See ESTOPPEL, BAR, and ABATEMENT.

The conditions and qualities of a plea are, 1. That it be fingle, and containing only one matter; for duplicity begets confufion. But by ftatute 4 & 5 Ann. c. 16. a man, with leave of the court, may plead two or more diftinct matters or fingle pleas; as in an action of affault and battery, thefe three, not guilty, *fon affault demefne*, and the ftatute of limitation. 2. That it be ftrict and pofitive, and not argumentative. 3. That it have convenient certainty of time, place, and perfons. 4. That it anfwer the plaintiff's allegations in every material point. 5. That it be fo pleaded as to be capable of trial. Special pleas are ufually in the affirmative, fometimes in the negative, but they always advance fome new fact not mentioned in the declaration; and then they muft be averred to be true in the common form; "and this he is ready to verify." This is not neceffary in pleas of the general iffue; thofe always containing a denial of the facts before advanced by the other party, and therefore putting him upon the proof of them.

It is a rule in pleading that no man be allowed to plead fpecially fuch a plea as amounts only to the general iffue, or a total denial of the charge; but in fuch cafe he fhall be driven to plead the general iffue in terms, whereby the whole queftion is referred to a jury. But if the defendant, in an affife or action of trefpafs, be defirous to refer the validity of his title to the court rather than to the jury, he may ftate his title fpecially, and at the fame time *give colour* to the plaintiff, or fuppofe him to have an appearance or colour of title, bad indeed in point of law, but of which the jury are not competent judges. When the plea of the defendant is thus put in, if it does not amount to an iffue, or total contradiction of the declaration, but only evades it, the plaintiff may plead again, and *reply* to the defendant's plea; either traverfing it, that is, totally denying it; as if on an action of debt upon bond, the defendant pleads *folvit ad diem*, that he paid the money when due, here the plaintiff in his *replication* may totally traverfe this plea, by denying that the defendant paid it; or he may allege new matter in contradiction to the defendant's plea; as when the defendant pleads *no award made*, the plaintiff may reply, and fet forth an actual award, and affign a breach; or the replication may *confefs and avoid* the plea, by fome new matter or diftinction, confiftent with the plaintiff's former declaration; as, in an action for trefpaffing upon land of which the plaintiff is feifed, if the defendant fhews a title to the land by defcent, and that therefore he had a right to enter, and gives colour to the plaintiff, the plaintiff may either traverfe and totally deny the fact of the defcent; or he may confefs and avoid it by replying, that true it is fuch defcent happened, but that fince the defcent the defendant himfelf demifed the lands to the plaintiff for term of life. To the replication the defendant may *rejoin*, or put in an anfwer called a *rejoinder*. The plaintiff may anfwer the rejoinder by a *fur-rejoinder*; upon which the defendant may *rebut*; and the plaintiff anfwer him by a *fur-rebutter*; which pleas, replications, rejoinders, fur-rejoinders, rebutters, and fur-rebutters, anfwer to the *exceptio*, *replicatio*, *duplicatio*, *triplicatio*, and *quadruplicatio* of the Roman laws. Inft. 4. 14. Bract. l. 5. tr. 5. c. 1.

The whole of this procefs is denominated the *pleading*; in the feveral ftages of which it muft be carefully obferved, not to depart or vary from the title or defence, on which the party has once infifted. For this (which is called a *departure* in pleading) might occafion endlefs altercation, therefore the replication muft fupport the declaration, and the rejoinder muft fupport the plea, without departing out of it. As in the cafe of pleading no award made, in confequence of a bond of arbitration, to which the plaintiff replies, fetting forth an actual award; now the defendant cannot rejoin that he hath performed this award, for fuch rejoinder would be an entire departure from his original plea, which alleged that no fuch award was made; therefore he has now no other choice, but to traverfe the fact of the replication, or elfe to demur upon the law of it. Yet in many actions the plaintiff who has alleged in his declaration a general wrong, may, in his replication, after an evafive plea by the defendant, reduce that general wrong to a more particular certainty, by affigning the injury afrefh with all its fpecific circumftances in fuch manner as clearly to afcertain and identify it, confiftently with his general complaint; which is called a *new* or *novel affignment*. Although duplicity in pleading muft be avoided for various reafons, yet it is often expedient to plead in fuch a manner, as to avoid any implied admiffion of a fact, which cannot with propriety or fafety be pofitively affirmed or denied. And this may be done by what is called a *proteftation*; by which the party interpofes an oblique allegation or denial of fome fact, protefting (by the gerund, *proteftando*) that fuch a matter does or does not exift; and at the fame time avoiding a direct affirmation or denial. The ufe of this proteftation is to fave the party from being concluded with refpect to fome fact or circumftance, which cannot be directly affirmed or denied without falling into duplicity of pleading; and which yet, if he did not thus enter his proteft, he might be deemed to have tacitly waived or admitted.

In any ftages of the pleadings, when either fide advances or affirms any new matter, he ufually avers it to be true, "and this he is ready to verify;" on the other hand, when either fide traverfes or denies the facts pleaded by his antagonift, he ufually tenders an iffue, as it is called; the language of which varies with the party by whom the iffue is tendered; for if the traverfe or denial comes from the defendant, the iffue is tendered thus, "and of this he puts himfelf upon the country," thereby fubmitting himfelf to the judgment of his peers; but if the traverfe lies upon the plaintiff, he tenders the iffue, or prays the judgment of the peers againft the defendant in another form; thus, "and this he prays may be inquired of by the country." But if either fide (*e. g.* the defendant) pleads a fpecial negative plea, not traverfing or denying any thing that was before alleged,

alleged, but disclosing some new negative matter; as when the suit is on a bond, conditioned to perform an award, and the defendant pleads negatively, that no award was made, he tenders no issue upon this plea; because it does not yet appear whether the fact will be disputed, the plaintiff not yet having asserted the existence of any award; but when the plaintiff replies, and sets forth an actual specific award, if then the defendant traverses the replication, and denies the making of any such award, he then, and not before, tenders an issue to the plaintiff. For when, in the course of pleading, they come to a point which is affirmed on one side, and denied on the other, they are then said to be at issue; all their debates being at last contracted into a single point, which must now be determined either in favour of the plaintiff or defendant. Blackst. Com. b. iii.

Plea, in *Equity*, may be either to the jurisdiction, shewing that the court has no cognizance of the cause; or to the person, shewing some disability in the plaintiff, as by outlawry, excommunication, and the like; or in bar, shewing some matter, wherefore the plaintiff can demand no relief, as an act of parliament, a fine, a release, or a former decree. And the truth of this plea the defendant is bound to prove, if put upon it by the plaintiff.

Plea *to Indictment*, is the plea of the prisoner, or defensive matter alleged by him on his arraignment, if he does not confess, or stand mute. Waiving the plea of sanctuary, which is now abrogated (see Sanctuary); there are five pleas of this kind. 1. A plea to the jurisdiction, which is when an indictment is taken before a court that hath no cognizance of the offence; as if a man be indicted for a rape at the sheriff's tourn, or for treason at the quarter-sessions; in these, or similar cases, he may except to the jurisdiction of the court, without answering at all to the crime alleged. (2 Hal. P. C. 256.) 2. A demurrer to the indictment. (See Demurrer.) 3. A plea in abatement, which is principally for a misnomer, a wrong name, or a false addition to the prisoner. But the prisoner derives little benefit from dilatory pleas of this kind; because, if the exception be allowed, a new bill of indictment may be framed, according to what the prisoner in his plea avers to be his true name and addition. 4. A special plea in bar, which affects the merits of the indictment, and gives a reason why the prisoner ought not to answer it at all, nor put himself upon his trial for the crime alleged. These pleas are of four kinds: a former acquittal, a former conviction, a former attainder, or a pardon. Here we may observe that, though in civil actions, in which a man may chuse what plea in bar to make, he is concluded by that plea and cannot recur to another; in criminal prosecutions, when a prisoner's plea in bar is found against him upon issue tried by a jury, or adjudged against him in point of law by the court, still he shall not be concluded or convicted thereon, but shall have judgment of *respondeat ouster*, and may plead over to the felony the general issue, not guilty. (2 Hal. P. C. 239.) For the law allows many pleas by which the prisoner may escape death; but only one plea, in consequence of which it can be inflicted, *viz.* on the general issue, after an impartial examination and decision of the facts, by the unanimous verdict of a jury. 5. The general issue, a plea of *not guilty*, upon which plea alone the prisoner receives his final judgment of death.

Plea *in Bar of Execution*, may be either insanity, pregnancy, the king's pardon, an act of grace, or diversity of person, *viz.* that he is not the same that was attainted and the like. In this last case a jury shall be impannelled to try this collateral issue, *viz.* the identity of his person, and not whether guilty or innocent; for that has been decided before. In these collateral issues, the trial shall be *instanter*, and no time allowed the prisoner to make his defence, or produce his witnesses, unless he will make oath that he is not the person attainted; neither shall any peremptory challenges of the jury be allowed the prisoner, though formerly such challenges were held to be allowable, whenever a man's life was in question.

Pleas *of the Sword*. Ranulph earl of Chester, 2 Hen. III. granted to his barons of Cheshire an ample charter of liberties, "exceptis placitis ad gladium meum pertinentibus."

The reason of the exception was, that William the Conqueror gave the earldom of Chester to his half-brother Hugh, commonly called Lupus, ancestor of this Ranulph. "Tenere ita libere ad gladium, sicut ipse rex tenuit Angliam & coronam."

Accordingly, in all indictments for felony, murder, &c. in the county palatine, the form was, "Contra pacem domini comitis, gladium & dignitatem suam;" or, "Contra dignitatem gladii Cestriæ." Such were the pleas for the dignity of the earl of Chester.

Pleas, *Court of Common*, called also common bench. See Court *of Common Pleas*.

PLEADING, Placitatio, a discourse spoken at the bar, in defence of the cause of a party.

From the time of the Conquest, all pleading was performed in French till the time of Edward III., when it was appointed, that the pleas should be pleaded in English, but that they should be entered, or recorded, in Latin. But now by 4 Geo. II. cap. 26. it is enacted, that all proceedings in courts of justice shall be in English.

At Athens, and even in France and England, it was prohibited to have any formed, or prepared pleading, or to amuse the court with long artificial harangues; only, in important matters, it was the settled custom to begin the pleadings with a passage in holy scripture.

It is but of late years that eloquence was admitted to the bar, where it has been much practised and encouraged.

Among the Athenians, an equal time was allowed both parties to plead, which was measured by a water hour-glass; and in order to see justice done in this respect, there was an officer appointed to distribute the water to each, whence he was called *ephydor*.

Pleadings, in the strictest sense, are all the allegations of the parties to a suit, made after the count, or declaration, till issue is joined: or, more generally, *pleadings* are the mutual altercations between the plaintiff and defendant; which at present are set down and delivered into the proper office in writing, though formerly they were usually put in by their counsel *ore tenus*, or *viva voce*, in court, and then minuted down by the chief clerks, or prothonotaries; whence in our old law French, the pleadings are frequently denominated the *parol*. The first of these is the *declaration*, which see. When the plaintiff hath stated his case in the declaration, it is incumbent on the defendant within a reasonable time to make his *defence*, and put in a *plea*; or else the plaintiff will at once recover judgment by *default*, or *nihil dicit* of the defendant. (See Defence.) After defence made, the defendant must put in his *plea*. But, before he defends, if the suit is commenced by *capias* or *latitat*, without any special *original*, he is entitled to demand one *imparlance*, or *licentia loquendi*; and may, before he pleads, have more granted by consent of the court; to see if he can end the matter amicably without farther suit, by talking with the plaintiff; a practice which is supposed to have arisen from a principle of religion, in obedience to the precept of the gospel (Matth. v. 25.); which

which precept has a plain reference to the Roman law of the 12 tables, which exprefsly directed the plaintiff and defendant to make up the matter, while they were *in the way*, or going to the prætor. There are many other previous fteps which may be taken by a defendant before he puts in his plea. When thefe proceedings are over, the defendant muft then put in his excufe or plea. For an account of the different pleas, and the further procefs by pleading; fee PLEA, *fupra*.

PLEASANT, in *Geography*, a town of Clermont county, in Ohio, containing 1245 inhabitants.—Alfo, in Fairfield county, containing 988 inhabitants.

PLEASANT, *Mount*. See MOUNT *Pleafant*; adding in that article after Pennfylvania, containing, in 1810, 1105 inhabitants.—Alfo, *Mount Pleafant* in Wafhington county, containing 1165; and *Mount Pleafant* in Weftmoreland, containing 1780 inhabitants, both in the fame ftate.—Alfo, in Jefferfon county, Ohio, containing 846 inhabitants.

PLEASANT *Point*, a N.E. headland in Merry-meeting bay, Lincoln county and ftate of Maine.—Alfo, a fertile and agreeably fituated point of land, on the weftern bank of the Paffamaquoddy river, about 15 miles from the mouth of the river, and four above Moofe ifland. On this point refide the remains of the Paffamaquoddy tribe of Indians, confifting of about 400 in number, and thought to be on the decline. They have a Roman Catholic prieft, and lately, a refpectable meeting-houfe has been erected at the expence of the ftate. Unacquainted with agriculture, their fummer employment is that of fifhing, and fhooting porpoifes, the oil of which they extract, and fell to the Americans for the ufe of lamps; and in winter they occupy themfelves in hunting. They have fome idea of moral obligation, but are not diftinguifhed for their honefty or fidelity. The women are graceful and delicate in their manners, and modeft in their drefs. The men are fullen and unfociable.—Alfo, the eaftern boundary of Hawk's, or Sandwich river, in the harbour of Chebucto.

PLEASANT *River*, a fmall village, with a poft-office, on the fea-coaft of Wafhington county, in Maine, at the head of Narraguagus bay; 16 miles N.E. of Goldfborough.

PLEASURE, the effect of a fenfation, or perception, agreeable to the mind, or of the gratification of fome appetite.

Pleafures may be diftinguifhed into two kinds. The firft, thofe which anticipate, or go before the reafon: fuch are all agreeable fenfations. Thefe are popularly called *pleafures of fenfe*, or *of the body*.

The fecond are thofe which do not precede, or anticipate, either the fenfes or reafon. Thefe we call *pleafures of the mind*. Such is the joy arifing from a clear perception of fome future good, or the confufed fenfation of a prefent one.

For an inftance of each. A man frequently finds pleafure in eating a fruit he was before unacquainted with; this is *anticipating pleafure*, which he feels before he knows the fruit to be good. On the other hand, a hungry hunter expects, or perhaps actually finds victuals; where the joy he conceives is a pleafure that follows from the knowledge of his prefent or future good.

Pleafure and *pain* feem to be no other than engines in nature's hand, by which we are directed to confult our own prefervation, and avoid our ruin. To things that may contribute to the one, as food, &c. fhe has annexed pleafure; and to thofe that may conduce to the other, as hunger, difeafes, &c. pain.

Among the multiplicity of things to be done, and to be avoided, for the prefervation of animal life, &c. how fhould we have diftinguifhed between the one and the other, but for the fenfation of pleafure or pain? Thefe are not only fpurs to urge us on, but alfo guides, to direct us whither we are to go. Wherever nature has fixed a pleafure, we may take it for granted, fhe there enjoins a duty; and fomething is to be there done, either for the individual, or for the fpecies.

Hence it is, that our pleafures vary at different ftages of life; the pleafures, *e. gr.* of a child, a youth, a grown man, an old man, &c. all tending to thofe particular things required by nature in that particular ftate of life, either for the prefervation, fimply, or, jointly, for that and propagation, &c.

Hence, from the different conftitutions of the body, at different ages, it were very eafy to account for all the particular taftes and pleafures thereof: not by deducing the pleafures mechanically from the difpofition of the organs in that ftate, but by confidering what is neceffary for the perfection and well-being of the individual in that ftate, and what is to contribute to that of the fpecies. In a child, *e. gr.* mere prefervation in the prefent ftate is not enough, it muft likewife grow: to bring this to pafs, nature has made the returns of hunger, &c. more frequent, as well as more acute, and the pleafures of feeding more exquifite. And that the excefs of aliment, in proportion to the bulk of the body, may be difpenfed with, fhe has made one of the great pleafures of the ftate to confift in a feries of fportive exercifes; by means of which the parts of the body come to be opened and expanded, and arrive at maturity. This done, the pleafures that conduced to it difappear; and others, fuited to the new ftate, fucceed.

In the Hartleyan fyftem, the capacity of pleafure and pain is one of the faculties of the human mind, by which a man becomes capable of action, enjoyment, or fuffering. Our affections, or paffions, are feelings arifing from the perception of pleafure or pain, or, in other words, of natural good or evil, according to the circumftances in which they are placed. "By the affections," fays Dr. Hartley, "we are excited to purfue happinefs and all its means, and to flee from mifery and all its apparent caufes." The primary affections in his fyftem are ten; five grateful, and five ungrateful: the former are love, defire, hope, joy, and pleafing recollection: the latter are hatred, averfion, fear, forrow, and difpleafing recollection. (See AFFECTION and PASSION.) The exiftence of this capacity of pleafure and pain we derive from confcioufnefs; and what pleafure and pain are, we learn from experience; thefe being feelings which cannot be expreffed by definition. Natural good produces pleafure, and that which produces pain is natural evil. Our pleafures and pains are either fenfible or intellectual, that is, they are the effect of either fenfations or ideas. The pleafurable and painful fenfations he thus explains by his theory of vibrations. Moderate vibrations are the caufes of pleafure, whilft violent vibrations occafion pain; hence the fame fenfation, which in a moderate degree is pleafurable, may, by increafing beyond certain limits, become exquifitely painful, as in the cafe of heat. Dr. Hartley conjectures, that the precife limit between pleafure and pain is the folution of continuity in the nerve that vibrates. Hence, Hartley and his difciples alfo account for the pleafure which accompanies the recovery from painful diforders, and from the recollection of paft pains, dangers, and troubles. The vigorous vibrations, which occafion pain, fubfide by length of time within the limits of pleafure. Hence, it has been fuggefted, we may account, at leaft in part, for the exiftence of evil in the univerfe, and are able to affign a reafon, why a ftate of probation, to beings conftituted like ourfelves, fhould be in a confiderable degree a ftate of fuffer- ing.

ing. Pains the moſt exquiſite and durable, it has been ſaid, may ultimately fall within the limits of pleaſure, and may be even eſſential to the production of the greateſt good. Dr. Hartley, in the ſequel of his "Treatiſe on Man," has ſhewn how, upon his ſyſtem of aſſociation and vibration, our five ſenſes, *viz.* feeling, taſte, ſmell, ſight, and hearing, produce intellectual pleaſures and pains, or the different affections, which are modifications of pleaſure and pain. Arranging the affections under ſix general claſſes, *viz.* imagination, emulation, ſelf-intereſt, ſympathy, theopathy, and the moral ſenſe; he traces them up to the aſſociation of ideas, and deduces them either from ſenſible pleaſures or pains, which are evidently original, or from the combination of other intellectual pleaſures or pains, which are derived from ſenſible ones. The pleaſures and pains of imagination ariſe from the perception of natural or artificial beauty or deformity; and theſe he diſtinguiſhes into ſeven kinds. The pleaſures and pains of ambition ariſe from the opinions of others concerning us; the ſenſe of honour and of ſhame. Thoſe of ſelf-intereſt ariſe from the poſſeſſion or want of the means of happineſs, and ſecurity from a ſubjection to the hazards of miſery. (See SELF-INTEREST.) For the pleaſures and pains of ſympathy, theopathy, and the moral ſenſe, ſee theſe ſeveral articles. See alſo *Mental* PHILOSOPHY.

PLEASURE *Boat*, among the *Ancients*. See THALAMEGUS.

PLEASURE *Garden*, in *Ornamental Gardening*, is that ſort of garden which is formed near to, or that ſurrounds a country-houſe or reſidence; and which is contrived for the purpoſe of curioſity, ornament, or entertainment. This ſometimes comprehends the whole pleaſure ground, but at other times is totally diſtinct from it. Pleaſure gardens ſhould conſtantly be laid out according to the nature and ſituation of the particular places where they are to be formed, being of greater or leſs extent as circumſtances may direct. They are moſtly planted either wholly or in the greateſt part with flowers and ſhrubs of the more beautiful and ornamental kinds, that they may afford as much beauty and variety as poſſible. In their forms they may be ſquare, oblong, or ſomewhat circular, and have the boundaries of the diviſions formed by the arrangements of curious ſhrubberies, embelliſhed with collections of the moſt rare, beautiful, and curious flowering ſhrubs; the interior parts being divided into many narrow compartments, either in the parterre method with ſtraight beds and borders, or into plain four-feet wide beds arranging parallel, with two-feet wide alleys between each, walks being carried all round next to the outer boundaries, after which borders ſurrounding the whole diviſions, and within theſe the different divided parts for the beds, as already noticed, which ſhould in general be raiſed in a gently rounding manner, the edges being ſet with dwarf-box, thrift, and pinks by way of variety, and the alleys and walks laid with the beſt and fineſt gravel.

In theſe diviſions may be planted the moſt curious and valuable hyacinths, tulips, polyanthos-narciſſuſes, jonquils, ranunculuſes, anemones, as well as moſt other ſorts of rare, hardy, bulbous, and tuberous-rooted flowers, each kind moſtly in a ſeparate manner, eſpecially of thoſe of the more choice ſorts, as being neceſſary, not only for the ſake of diſtinction, but for the convenience of occaſionally giving them protection from ſevere and inclement weather. In theſe ſituations, there may likewiſe be put out curious collections of the fineſt deſcriptions of fibrous-rooted flowering plants, ſuch as carnations, polyanthuſes, auriculas, and many other kinds, ſome of which being placed in ſeparate beds, as thoſe of the more valuable ſorts, and others diſperſed in different compartments, in order to give the greateſt poſſible degrees of variety. Still further, in other compartments, there may be exhibitions containing great varieties of all the different kinds of both the bulbous and fibrous-rooted ſorts of flowering plants.

Gardens of this kind ſhould conſtantly, in every part, be kept clean, neat, and perfectly in order.

PLEASURE *Ground*, in *Gardening*, any ſort of ornamented ground round a reſidence. It comprehends all the ornamental compartments or diviſions of ground and plantation; ſuch as lawns, plantations of trees and ſhrubs, flower compartments, walks, pieces of water, &c. whether ſituated wholly within the ſpace generally conſidered as pleaſure ground, or extended over hahas, or by other communications, to the adjacent fields, parks, paddocks, or out grounds.

In deſigns for pleaſure grounds, modern improvements reject all formal works, ſuch as long ſtraight walks, regular interſections, ſquare graſs plots, correſponding parterres, quadrangular and angular ſpaces, incloſed with high clipped hedges, &c., as well as all other uniformities; inſtead of which, open ſpaces of graſs ground of varied forms and dimenſions, and winding walks, all bounded with plantations of trees, ſhrubs, and flowers, in various clumps and other diſtributions, are exhibited in a variety of imitative rural forms, as curves, projections, openings, and cloſings, in imitation of a natural aſſemblage, having all the various plantations open to the walks and lawns. A ſpacious open lawn of graſs ground being generally firſt exhibited immediately in the front of the manſion, or main habitation, ſometimes widely extended in open ſpace on both ſides to admit of greater proſpect, &c., and ſometimes more contracted towards the habitation, widening gradually outward, and having each ſide embelliſhed with plantations of ſhrubbery, groves, thickets, &c., in clumps, and other parts, in ſweeps, curves, and projections, towards the lawn, &c., with breaks or openings of graſs ſpaces at intervals, between the plantations; and ſerpentine gravel walks winding under the ſhade of the trees; extended plantations being alſo carried round next the outer boundary of the ground, in various openings and cloſings, having alſo gravel walks winding through them, for ſhady and private walking; and in the interior diviſions of the ground ſerpentine winding walks exhibited, and elegant graſs openings, arranging various ways, all bordered with ſhrubberies, and other tree and ſhrub plantations, flower compartments, &c., diſpoſed in a variety of different rural forms and dimenſions, in eaſy bendings, concaves, projections, and ſtraight ranges, occaſionally; with intervening breaks or openings of graſs ground between the compartments of plantations, &c., both to promote rural diverſity, and for communication and proſpect to the different diviſions; all the plantations being ſo variouſly arranged, as gradually to diſcover new ſcenes, each furniſhing freſh variety, both in the form of the deſign in different parts, as well as in the diſpoſition of the various trees, ſhrubs, and flowers, and other ornaments and diverſities.

So that in theſe deſigns, according to modern gardening, a tract of ground of any extent may have the proſpect varied and diverſified exceedingly, in a beautiful repreſentation of art and nature, ſo that in paſſing from one compartment to another, new varieties preſent themſelves in the moſt agreeable manner; and even if the figure of the ground be irregular, and its ſurface has many inequalities, in riſings and fallings, and other irregularities, the whole may be improved without any great trouble of ſquaring and levelling, as by humouring the natural form, even the very irregularities may be made to conceal their natural deformities, and carry along with them an air of diverſity and novelty.

 In

In thefe rural works, however, we fhould not entirely abolifh all appearance of art and uniformity; for thefe, when properly applied, give an additional beauty and peculiar grace to all natural productions, and fet nature in the faireft and moft advantageous point of view. One principal point in laying out a pleafure ground, is for the defigner to take particular care that the whole extent of his ground be not taken in at one view, as where the contrary is the cafe, there is a tamenefs and want of proper effect produced.

It is impoffible to give any directions for planting a pleafure ground; as the plan may be varied exceedingly, according to the natural figure, pofition, and fituation of the land, and tafte of the defigner.

In refpect to the fituation, it muft be immediately contiguous to the main houfe, whether high or low fituated: however, a fomewhat elevated fituation, or the fide or fummit of fome moderate rifing ground, is always the moft eligible on which to erect the chief habitation, arranging the pleafure ground accordingly; fuch an expofure being the moft defirable, both for the beauty of the profpect and healthfulnefs of the air; a low level fituation neither affording a due profpect of the ground, nor the adjacent country, befides being liable to unwholefome dampnefs, and fometimes inundation in winter: there are, however, many level fituations, forming plains or flats, that poffefs great advantages both of foil and profpect, and the beauties of water without too much moifture; there are alfo fometimes large tracts of ground, confifting both of low and high fituations, as level plains, hollows, eminences, declivities, and other inequalities, which may be fo improved as to make a moft defirable pleafure ground, as the fcene may be varied in the moft beautful manner imaginable; but as the choice of fituation and fcope of ground is not always attainable, every one muft regulate his plan in the moft commodious manner poffible, agreeable to the nature of the particular fituation, extent of ground, and plan which has been adopted.

The extent of pleafure grounds may be varied, according to that of the eftate or premifes, and other circumftances, as from a quarter or half an acre to thirty or forty or more.

The ground for this purpofe fhould previoufly be well fenced in, by a wall, paling, hedge, or parts of each fort, and in fome parts a foffe or haha, where it may be neceffary to extend the profpect, either at the termination of a lawn, walk, or avenue; and the clofe fences fhould generally be concealed withinfide, particularly the wall and paling fences, by a range of clofe plantation, unlefs where the wall may be wanted for the culture of wall fruit. But fometimes, when the pleafure ground adjoins to a fine park, paddock, or other agreeable profpect, the boundary fence on that fide is often either a low edge, or a haha; but many prefer the latter, efpecially at the termination of any fpacious opening, both to extend the profpect more effectually, and give the ground an air of greater extent, than it really has, at a diftance; the haha being funk, nothing like a fence appears, fo that the adjacent park, fields, &c. appear to be connected with the grounds.

The arrangement of the feveral divifions, both internal and external, muft be wholly regulated by the nature and extent of the ground.

And in whatfoever mode fuch grounds are laid out, the whole of the different quarters, walks, and other parts, fhould be kept in an exact and neat order.

According to Mr. Loudon, the pleafure ground may confift of fcenes of different expreffions of avowed art, as thofe of gardening; and of nature, as thofe of picturefque improvement, fuch as tranquil or fequeftered glades, romantic glens, flowery meads, furzy heaths, tangled dingles, wooded dells, rocky fteeps, and numberlefs others, which are to be met with in a varied or picturefque country, and are either to be heightened in effect, or preferved from cultivation by the improver. Wherever the pleafure ground is not under fome of the particular fcenes of ornamental gardening, it fhould be fed at leaft by fheep, and often by horfes, cattle, &c., which fhould be allowed to come clofe to the terrace wall that feparates the lawn from the manfion; for what can be more dull and unnatural, than the modern method of furrounding a houfe by a naked lawn totally deftitute of animation?

A hollow winding dell or dingle, containing a brook or rill overhung with wood, and its banks diverfified by broken ground prefenting various coloured earths, and among the low growths old trunks of trees, roots, and ftones, or dells of a grander character, containing bold, perpendicular, projecting, or irregular, maffive rocks, overhung with huge trees, bufhes, ferns, and creepers, grouped and combined in an infinite diverfity of ways,—the ftream, interrupted by the rocks, tumbling over in roaring cataracts, foaming cafcades, or interrupted only by gentle falls,—and perhaps in fome places, where the dell widens into a valley, fpreading itfelf into a cryftal lake, varied by little iflands and woody projections, all heightened by the ufual appendages of animation, the finging of birds, the fragrance of flowers, from what is confidered to be among the moft enchanting kinds of reclufe pleafure ground fcenery. When a place is fortunate enough to have fuch a romantic chain of picturefque beauty as this, it fhould feldom be touched by the hand of art. It may happen, that fome improvement may be made, by fhewing, in a partial manner, rocks, roots, or ftones, that are perhaps totally concealed; by augmenting a natural cafcade, or by fupplying ivy, or fome other creepers, or evergreens, &c.; but in general little more can be attempted with propriety. The principal operation, that in any cafe can be undertaken in fuch a fcene, is, where it may be requifite to lead through a walk, or road, either to obferve its beauties, or as an approach to fome other part of the refidence. The difficulty of executing either of thefe will be great to thofe, who think of nothing but undulating fweeps, fhaven lawns, and ferpentine gravel walks; but by thofe accuftomed to admire this kind of fcenery, the operation will eafily be accomplifhed. See RESIDENCE.

PLEASURE *of the King*, in *Law*, is ufed in connection with the infliction of punifhment for any crime, not to fignify any extrajudicial will of the fovereign, but fuch as is declared by his reprefentatives, the judges in his courts of juftice: "voluntas regis in curia, non in camera." 1 Hal. P. C. 375.

PLEAU, LA, in *Geography*, a town of France, in the department of the Correze, and chief place of a canton, in the diftrict of Tulles; 18 miles E. of Tulles. The place contains 655, and the canton 6355 inhabitants, on a territory of 232½ kiliometers, in 8 communes.

PLEAUX, a town of France, in the department of the Cantal, and chief place of a canton, in the diftrict of Mauriac; 8 miles S.W. of Mauriac. The place contains 2584, and the canton 10,667 inhabitants, on a territory of 182½ kiliometres, in 12 communes.

PLEBANUS was anciently the title of a rural dean.

The denomination arofe hence, that thefe deaneries were then affixed to the *plebania*, or chief mother-church within fuch a diftrict; which, at firft, was ufually ten parifhes.

PLEBANUS feems alfo to have been ufed for a parifh-prieft of fuch a large mother-church, as was exempt from the jurifdiction of the ordinary; fo that he had the authority of

 a rural

a rural dean committed to him by the archbiſhop; to whom the church was immediately ſubject.

PLEBEIAN, Plebeius, a perſon of the rank of the populace, or common people.

The term is chiefly uſed in ſpeaking of the ancient Romans; who were divided, about the time of Tarquin's expulſion, into ſenators, knights, and plebeians, or commons.

The plebeians were thoſe who could not claim their deſcent from the ancient ſenators, appointed by Romulus, and the kings who ſucceeded him.

Plebeian *Games*, were games celebrated by the Roman people, in remembrance, as ſome ſay, of their reconciliation with the ſenators, after the expulſion from the city, in the year of Rome 261; or, according to others, in token of their public rejoicing, when the kings were driven from Rome, A.U.C. 245, and the people enjoyed their liberty. Theſe games were celebrated in the circus for three days, and commenced on the ſeventh of the calends of December. Adrian inſtituted plebeian games in the circus, A.U.C. 874.

PLEBISCITUM, among the Romans, a law enacted by the common people, at the requeſt of the tribune, or ſome other plebeian magiſtrate, without the intervention of the ſenate.

Plebiscitum is more particularly applied to the law which the people made, when, upon ſome miſunderſtanding with the ſenate, they retired to the Aventine mount.

PLECH, in *Geography*, a town of Germany, in the principality of Culmbach; 21 miles S. of Pegnitz.

PLECHAS, a word uſed by Hippocrates to expreſs that region of the body which is terminated backward by the anus, forward by the pudenda, and ſideways by the hips.

PLECTANÆ, a word uſed by ſome to expreſs the cornua uteri, and by others, for any plexus of veſſels.

PLECTRANTHUS, in *Botany*, received that name from l'Heritier, in alluſion to the *ſpur*, πληκτρον, of the corolla, which he conceived to be an eſſential part of the generic character.—L'Herit. Stirp. 85. Schreb. 396. Willd. Sp. Pl. v. 3. 168. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 3. 425. Brown Prodr. Nov. Holl. v. 1. 505. (Germanea; Juſſ. 116. Lamarck Illuſtr. t. 514.)—Claſs and order, *Didynamia Gymnoſpermia*. Nat. Ord. *Verticillatæ*, Linn. *Labiatæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, ſomewhat bell-ſhaped, ſhort, two-lipped; upper lip ovate, broadeſt, aſcending; lower four-cleft, acute, the two lower ſegments rather the longeſt. *Cor.* of one petal, ringent, reverſed; tube compreſſed, longer than the calyx: one lip, which is turned uppermoſt, broadeſt, three-cleft; its middle ſegment very large, emarginate; lateral ones ſmall: the other, directed downwards, narrower, entire, ovate, concave. Nectary a ſpur or prominence, from the baſe of the tube of the corolla, pointing upwards. *Stam.* Filaments four, declining, awl-ſhaped, two of them rather the ſhorteſt; anthers ſimple. *Piſt.* Germen four-lobed; ſtyle thread-ſhaped, the length and poſition of the ſtamens; ſtigma cloven, acute. *Peric.* none, the calyx containing the four roundiſh *ſeeds*.

Eſſ. Ch. Upper lip of the calyx largeſt; lower four-cleft. Corolla reverſed, ringent, its tube ſpurred on the upper ſide. Stamens ſimple.

Such are the characters of this genus, as originally defined by its author, who conſidered the reverſed corolla, or flower; the ſpur or prominence of the tube; and the ſimple ſtamens; as eſſential marks. The two latter eſpecially were ſuppoſed to diſtinguiſh it from Ocimum; ſee that article. Mr. Brown however, looking more deeply into this latter genus, and finding ſeveral of its ſpecies without any tooth or appendage to their filaments, has referred ſuch to *Plectranthus*, waving the conſideration of the ſpur. He therefore gives the following character of *Plectranthus*.

Calyx two-lipped, ſtriated, the lower lip divided; the baſe tumid beneath when in fruit. Upper lip of the corolla three-cleft, the middle ſegment two-lobed; lower lip longer, undivided, (moſtly concave.) Stamens declining; their filaments without teeth, (ſometimes united at the baſe;) anthers of one cell, beardleſs.

This includes, not only the *Plectranthus* of other authors, and the toothleſs ſpecies of *Ocymum*, but alſo the *Dentidia* and *Coleus* of Loureiro. Mr. Brown does not admit *Lavandula carnoſa* into this genus, from which he ſays it differs in calyx and infloreſcence, though agreeing in corolla, ſtamens and ſtigma, conſtituting, in his opinion, a genus by itſelf. (See Lavandula, at the end.) All the ſix New Holland ſpecies of Mr. Brown's *Plectranthus* are deſtitute of a ſpur. As the queſtion is rather doubtful, while the whole genus of *Ocymum* requires to be critically examined, we ſhall here exhibit only ſuch ſpecies of the genus before us as we conceive to anſwer to its original idea.

1. P. *fruticoſus*. Shrubby Plectranthus. L'Herit. Stirp. 85. t. 41. Willd. n. 1. Ait. n. 1. (Germanea urticifolia; Lamarck Dict. v. 2. 690.)—Nectary ſpurred. Cluſters compound. Flower-ſtalks three-cleft. Stem ſhrubby, downy.—Found at the Cape of Good Hope, from whence Mr. Maſſon ſent it in 1774 to Kew. This is a greenhouſe ſhrub, flowering copiouſly from June to September. Every part has a fragrant ſcent. The *ſtem* is clothed with fine ſhort down, unſpotted. *Leaves* oppoſite, ſtalked, ovate, ſtrongly ſerrated like thoſe of a common nettle, veiny, roughiſh. *Flowers* copious, in pale violet cluſters.

2. P. *galeatus*. Helmet Plectranthus. Vahl. Symb. v. 1. 43. Willd. n. 2.—Nectary gibbous. Partial flower-ſtalks branched. Leaves ovate, ſomewhat heart-ſhaped, pointed, ſerrated.—Native of Java. *Stem* villous, furrowed. *Leaves* ſtalked, broadly ovate, villous, eſpecially the veins beneath. *Cluſter* terminal; the flower-ſtalks oppoſite, branched, without *bracteas*. *Corolla* downy; its lower lip hooded.

3. P. *nudiflorus*. Naked-flowered Plectranthus. Willd. n. 3.—Nectary gibbous. Panicle racemoſe, naked. Leaves heart-ſhaped, rugged; the upper ones claſping the ſtem.—Suppoſed to be a native of China; Willdenow having ſeen it in gardens under the name of *Ocimum chinenſe*. *Root* perennial. *Stem* erect, ſquare, downy, ſcarcely ſix inches high. Lower *leaves* ſtalked, two or three inches long, coarſely toothed, rugoſe, ſmooth, except the veins at the back. *Panicle* a foot or more in length; each whorl of four cluſters an inch long, turned one way, with two ſmall heart-ſhaped *bracteas*. *Corolla* ſmall, cloſed, downy.

4. P. *Forſkolaei*. Bearded Plectranthus. Vahl. Symb. v. 1. 44. Willd. n. 4. Ait. n. 2. (P. barbatus; Andr. Repoſ. t. 594.)—Nectary gibbous. Cluſters naked. Stem even, quadrangular.—Native of Arabia. *Forſkäll.* Commerſon gathered it in Madagaſcar and the Mauritius, and lord Valentia ſent it to England in 1806. The whole *herb* is downy. *Root* tuberous, increaſing prodigiouſly in its native ſoil. *Leaves* ovate, crenate, bluntiſh, ſtalked. *Flowers* in a long, whorled, upright *cluſter*, pendulous, pale purple, hairy externally.

5. P. *craſſifolius*. Thick-leaved Plectranthus. Vahl. Symb. v. 1. 44. Willd. n. 5.—Nectary gibbous. Cluſters bracteated. Leaves ovate, fleſhy.—Native of Egypt. Differs

Differs from the laſt, according to Vahl, in its fleſhy *leaves*, and in having ovate membranous *bracteas*.

6. P. *punctatus*. Dotted Plectranthus. L'Herit. Stirp. 87. t. 42; not 41. Willd. n. 6. Ait. n. 3. (Ocymum punctatum; Linn. Suppl. 275.)—Nectary gibbous. Cluſter denſe. Stem herbaceous, tumid, hairy.—Native of Africa, where it is ſaid to have been found by Mr. Bruce the famous traveller. This ſpecies is biennial, flowering in the greenhouſe from January to May. The tumid, fleſhy, purple-dotted, hairy *ſtem* diſtinguiſhes it. The *footſtalks* are ſhort. *Corolla* very pale blue.

7. P. *carnoſus*. Denſe-ſpiked Plectranthus. (Lavandula carnoſa; Linn. fil. Diſſ. 9. t. 2. Am. Acad. v. 10. 52. t. 3. Ait. Hort. Kew. v. 3. 383. Katu-Kurka; Rheede Hort. Malab. v. 10. 179. t. 90. Nepeta indica, rotundiore folio; Moriſ. Sect. 11. t. 6. f. 7.)—Nectary gibbous. Spikes ovate, denſe. Leaves ovate, ſomewhat heart-ſhaped, fleſhy, wavy or ſerrated.—Found by Koenig, on dry walls and rocks, at Sadraſs in the Eaſt Indies, flowering in the hotteſt ſeaſon, after which the foliage appears. The *ſtem* is ſhrubby, but ſucculent, finely hoary. *Leaves* ſtalked, ovate or ſlightly heart-ſhaped, wavy, or more or leſs deeply ſerrated, very fleſhy, minutely hoary, varying greatly in ſize. *Spikes* generally three or four to each branch, ſtalked, ſolitary and ſimple, ovate, thick, very much crowded, the *calyces* ſingularly reflexed, or imbricated downward. *Corolla* yellowiſh. Rheede ſpeaks of this plant as aromatic, and uſeful againſt the bite of ſome ſerpents. It was ſent to Kew in 1788 by ſir Joſeph Banks, and is kept in the ſtove, flowering in June and July; but the *root* is ſaid to be only biennial.

PLECTRONIA, ſo named by Linnæus, from πληκτρον, *a cock's ſpur*, which its thorns very much reſemble.—Linn. Mant. 6. Schreb. 153. Willd. Sp. Pl. v. 1. 1152. Mart. Mill. Dict. v. 3. Juſſ. 382. Lamarck Illuſtr. t. 146.—Claſs and order, *Pentandria Monogynia*. Nat. Ord. akin to *Rhamni*, Juſſ. Linnæus refers it to his *Contortæ*, in his Prælectiones in Ord. Nat. 408.

Gen. Ch. *Cal.* Perianth ſuperior, of one leaf, turbinate, with five ſlight teeth, the mouth cloſed with five hairy ſcales, pemanent. *Cor.* Petals five, lanceolate, ſeſſile, inſerted into the mouth of the calyx. *Stam.* Filaments five, very ſhort; anthers two-lobed, roundiſh, each ſheltered by one of the ſcales of the calyx. *Piſt.* Germen inferior; ſtyle thread-ſhaped, ſhorter than the calyx; ſtigma ovate. *Peric.* Berry oblong, of two cells. *Seeds* ſolitary, oblong, compreſſed.

Eſſ. Ch. Petals five, inſerted into the mouth of the calyx, which is cloſed by five hairy ſcales. Berry inferior, with two ſeeds.

1. P. *ventoſa*. Linn. Mant. 52. (P. corymboſa; Burm. Prodr. Cap. 6. Rhamnus foliis ſubrotundo-acuminatis, fructu racemoſo; Burm. Afr. 257. t. 94.)—Native of woods at the Cape of Good Hope, flowering in September; a ſtranger, as yet, in our gardens. This is a *tree*, whoſe trunk and principal branches are armed with very conſiderable, long, tapering, ſimple, oppoſite ſpines. The *leaves* are oppoſite, ſtalked, elliptical, acute at each end, entire thick-edged, ſomewhat wavy and revolute, ſmooth on both ſides; poliſhed above; paler and opaque beneath; with one rib, and many tranſverſe veins. *Flowers* ſmall, yellow, in compound, axillary, denſe *cluſters*, about twice the length of each *footſtalk;* their *ſtalks* oppoſite, angular, rather downy, with oppoſite, minute, deciduous *bracteas* under their ſubdiviſions.

We are at a loſs for the meaning of the ſpecific name given by Linnæus, which is not ſo good as Burmann's. The *tree* is ſaid to be well calculated for making hedges. The habit and appearance of every part ſeem rather to juſtify the opinion of Linnæus than of Juſſieu, reſpecting the natural order to which this plant belongs, but the inferior germen, if it be really ſo, is adverſe to both.

PLECTRONITÆ. See Conicthyodontes.

PLECTRUM, a word uſed by ſome anatomical writers to expreſs the ſtyloid proceſs of the os petroſum; by others for the uvula; and by others for the tongue.

Plectrum, πληκτρον, a machine of wood or ivory uſed by the ancients in playing upon the lyre, crooked and pointed at both ends, in uſing which there was more ſpirit given to the tone, and leſs danger of hitting the wrong ſtring than by uſing the finger. The quill uſed in playing on the mandoline, is in miniature what we may ſuppoſe the plectrum to have been with reſpect to the lyre.

PLEDGE, in *Law*. See Vadium.

Pledge. See Process.

Pledge, *Plegius*, a ſurety, or gage, either real or perſonal, which the plaintiff, or demandant, is to find, for his proſecuting the ſuit.

The word is ſometimes alſo uſed for frank pledge.

To Pledge, in *Drinking*, denotes to warrant, or be ſurety to one, that he ſhall receive no harm while he is taking his draught.

The phraſe is referred, by our antiquaries, to the practice of the Danes, heretofore, in England; who frequently uſed to ſtab, or cut the throats of the natives while they were drinking.

PLEDGERY, or Pleggery, ſuretiſhip, or an undertaking, or anſwering for another.

The appellant ſhall require the conſtable and mareſchal to deliver his pleggs, and to diſcharge them of their pledgery; and the conſtable and mareſchal ſhall aſk leave of the king to acquit his pleggs, after that the appellant is come into the liſts to do his devoir. Orig. Jur. ex Vet. Cod. MS. in Bibl. Selden.

PLEDGES *of Goods for Money*, &c. See Pawn and Bailment.

PLEDGET, in *Surgery*, a kind of flat tent, made not to enter a wound, but to be laid upon it, to imbibe the ſuperfluous humours, and keep it clean and dry.

PLEEA, in *Botany*, a name of Michaux's, which ſeems intended to expreſs the ſuperabundance of ſtamens compared with others of its kindred, from πλεῖον, *more*. Mich. Boreal. Amer. v. 1. 247. Purſh Am. Sept. v. 1. 275.—Claſs and order, *Enneandria Trigynia*. Nat. Ord. *Tripetaloideæ*, Linn. *Junci*, Juſſ.

Gen. Ch. *Cal.* Sheath of one leaf. *Cor.* of one petal, divided to the baſe into ſix ſpreading, nearly equal, linear-lanceolate, acute ſegments, permanent. *Stam.* Filaments nine, awl-ſhaped, ſhorter than the corolla, inſerted into the baſe of its ſegments; anthers oblong, verſatile, of two cells, opening lengthwiſe. *Piſt.* Germen ſuperior, oblong, triangular; ſtyles none; ſtigmas three, ſeſſile, linear, obtuſe. *Peric.* Capſule covered by the permanent cloſed corolla, roundiſh-triangular, of three cells, without any manifeſt partitions, except the inflexed margins of the valves, the cells burſting longitudinally at their inner edge, the valves ſplitting at the top. *Seeds* numerous, oblong, cylindrical, ſlightly curved, inſerted into the margins of the valves, each by a ſhort ſtalk.

Eſſ. Ch. Corolla in ſix deep ſpreading ſegments. Capſule triangular, of three cells. Seeds numerous, oblong, inſerted into the margins of the valves. Sheaths ſimple, ſingle-flowered.

1. P. *tenuifolia*. Michaux Boreal. Amer. v. 1. 248. t. 25. Purſh

Purfh v. 1. 278.—The only fpecies; a native of open wet woods in Lower Carolina. *Michaux.* The *root* is perennial, refembling that of an *Iris*. *Leaves* few, radical, fheathing at the bafe, erect, very narrow, fmooth, flattened, taper-pointed, about half as tall as the common *flower-ftalk*, which is radical, about a foot and half high, fimple, erect, round, fmooth, nearly naked. *Clufter* terminal, erect, fimple, of fix or eight yellowifh-brown ftalked *flowers*, the fize of *Ornithogalum umbellatum*, each accompanied by a tubular pointed *fheath* as long as the flower of its ftalk. This plant agrees in number of *ftamens*, though not of *piftils*, with our *Butomus umbellatus*, a genus of the fame natural order, but the ftructure of the *feeds*, and their infertion, are both different, as well as the *inflorefcence*.

PLEGII *de Retorno*, &c. in *Law*. See REPLEVY and RETORNO *Habendo*.

PLEGIIS ACQUIETANDIS, a writ that lies for a furety, againft him for whom he is furety, in cafe he pay not the money at the day. Fitz. Nat. Brev.

PLEGORRHIZA, in *Botany*, from πληγη, *a wound*, and ῥιζα, *a root*, becaufe the root of this plant is ufed by the inhabitants of Chili as a vulnerary. Molin. Chil., the German edition, 140. Willd. Sp. Pl. v. 2. 487. Juff. 438. —Clafs and order, *Enneandria Monogynia*.

Eff. Ch. Calyx none. Corolla of one petal. Capfule of one cell. Seed folitary.

1. P. *adftringens*. Willd. n. 1. (P. Guajcuru; Molina as above.)—Native of the northern provinces of Chili. *Stem* woody. Radical *leaves* collected into a tuft, ftalked, oval, fimple, undivided; thofe on the branches feffile, ovate. *Flowers* numerous, ftalked, terminal. *Corolla* undivided. *Stamens* nine, very fhort. *Anthers* oblong. *Germen* orbicular. *Style* cylindrical, the length of the ftamens. *Stigma* fimple. *Capfule* oblong, rather compreffed. *Seed* of the fame fhape. Juffieu reckons a *calyx*, what Willdenow, as above, terms *corolla*, and advifes that the genus fhould be compared with his orders of *Lauri* and *Polygoneæ*.

PLEGRA, in *Ancient Geography*, a town of Afia, in the interior of Galatia, in the country of the Paphlagonians: placed by Ptolemy between Zagira and Sacora.

PLEIADES, Πλειαδες, in *Aftronomy*, an affemblage of feven ftars in the neck of the conftellation Taurus.

They are thus called from the Greek πλειν, *navigare, to fail;* as being terrible to mariners, on account of the rains and ftorms that frequently rife with them.

The Latins call them *vergiliæ*, from *ver, fpring;* becaufe of their rifing about the vernal equinox.

The largeft is of the third magnitude, and is called *Lucida Pleiadum*. See TAURUS.

There are now only fix ftars vifible in Pleiades, and this appears to have been the cafe fo long ago as the time of Ovid:

"Quæ feptem dici, fex tamen effe folent."

PLEIADES, in *Mythology*, were the feven daughters of Atlas, called Maya, Electra, Taygefa, Afteropa, Alcione, Celeno, and Merope. Thefe Atlantides, it is faid, were tranflated to the heavens, and formed the Pleiades; the meaning of which fable is, that Atlas firft obferved thefe ftars, and called them by the names of his daughters.

PLEIADES, *Poetical*, is a name which the Greeks gave to feven celebrated poets, flourifhing under the reign of Ptolemy Philadelphus.

In imitation of the Greeks, Ronfard formed a Pleiades of French poets under the reign of Henry II. It confifted of Daurat, Ronfard, du Bellay, Belleau, Baif, Tyard, and Jodelle.

On the fame model, fome of their authors afterwards projected a new Pleiades of the Latin poets of the laft century; but they were not agreed about the names of thofe that fhould compofe it; much lefs on him who fhould be the Lucida Pleiadum. M. Baillet named F. Rapin, F. Commire, F. de la Rue, M. de Santeuil, M. Menage, M. du Perier, and M. Petit.

PLEIN RIVER, in *Geography*, the northern head-water of Illinois river; it interlocks with Chicago river, a water of lake Michigan, and five miles below Dupage lake, through which it paffes; it joins Theakiki river, which comes from the eaftward. Thence the united ftream takes the name of Illinois. The land between thefe branches is rich, and intermixed with fwamps and ponds.

PLEINFELD, or BLEINFELD, a town of Bavaria, infulated in Anfpach; 22 miles S.E. of Anfpach. N. lat. 49° 3′. E. long. 10° 55′.

PLEINEFOUGE'RES, a town of France, in the department of the Ille and Villaine, and chief place of a canton, in the diftrict of St. Malo. The town contains 2726, and the canton 12,878 inhabitants, on a territory of 167½ kiliometres, in 11 communes.

PLEINTING, a town of Bavaria, on the Danube; 5 miles S.S.E. of Ofterhof.

PLEISKE, a river of Brandenburg, which runs into the Oder; 9 miles above Francfort.

PLEISNITZ, a town of Hungary, 25 miles W. of Cafchau.

PLEISSA, a river of Saxony, which runs into the Elfter, near Leipfic.

PLEISSEN, or PLEISSA, a lordfhip of Germany, in the principality of Heffe Rhinfels, infulated in the duchy of Brunfwick. It takes its name from an old caftle fituated on a mountain.

PLEISVEDEL, a town of Bohemia, in the circle of Leitmeritz; 8 miles S.W. of Leypa.

PLE'LAN, a town of France, in the department of the Ille and Villaine, and chief place of a canton, in the diftrict of Montfort; fix pofts E.N.E. of Vannes. The place contains 2917, and the canton 13,316 inhabitants, on a territory of 325 kiliometres, in 8 communes.—Alfo, a town of France, in the department of the Northern Coafts, and chief place of a canton, in the diftrict of Dinan; 6 miles E. of Loudeac. The place contains 854, and the canton 3903 inhabitants, on a territory of 122½ kiliometres, in 9 communes.

PLEMMYRIUM, in *Ancient Geography*, a promontory on the eaftern coaft of Sicily, over-againft Syracufe, of which it was the port, according to Thucydides. It is alfo mentioned by Virgil.

PLEMMYROS, a word ufed by the old Greek writers to exprefs a redundance of humours. Its proper fignification is the flowing in of the tide.

PLEMPIUS, VOPISCUS FORTUNATUS, in *Biography*, an eminent phyfician, was born at Amfterdam, of a diftinguifhed family, in December 1601. He received his claffical education at Gand, and ftudied philofophy at Louvain, whence he repaired to Leyden, and commenced his medical ftudies. He fubfequently travelled into Italy, and paffed the principal portion of his time at Padua and Bologna, having the advantage of purfuing his anatomical inveftigations under the direction of Spigelius at the former place, and of taking his degree of doctor at the latter. On his return to Holland, he fettled in the practice of his profeffion in his native city, where he acquired a high reputation; and was induced to accept the invitation of Ifabella, princefs of the Low Countries, to the vacant profefforfhip of

P L E

of the Inſtitutes of Medicine, at Louvain, of which he took poſſeſſion in 1633. At the ſame time he abjured the Proteſtant faith, became a Catholic, and took a new degree of doctor, in conformity with the rules of the univerſity. In the following year, however, he quitted this chair, for the profeſſorſhip of pathology. He was ſoon afterwards nominated principal of the college of Breugel. He died at Louvain in December 1671, aged ſeventy.

Plempius increaſed the reputation of Louvain by the extent of his attainments, and was an able controverſialiſt, diſtinguiſhing himſelf in all the public queſtions that came under diſcuſſion. He left the following works. "A Treatiſe on the Muſcles," in Dutch. "Ophthalmographia, ſive de Oculi Fabricâ, Actione, et Uſu," Amſt. 1632; Lovæn. 1648. A tranſlation of the Anatomy of Cabrolius into Dutch, with notes; Amſt. 1633. "Fundamenta, ſeu Inſtitutiones Medicinæ;" Lov. 1638, 1644, &c. In the firſt edition of this work, Plempius doubted the circulation of the blood; but in the ſecond, he was a ſtrenuous advocate for that doctrine. "Animadverſiones in veram Praxim curandæ Tertianæ propoſitam à Doctore Petro Barba;" ibid. 1642. "Antimus Coningius Peruviani pulveris defenſor, repulſus à Melippo Protymo;" ibid. 1655. Coningius is the aſſumed name of Honoratus Fabri; Protymus was that aſſumed by Plempius in order to decry the uſe of cinchona. "Avicennæ Canonis Liber primus et ſecundus ex Arabica Lingua in Latinam tranſlatus;" ibid. 1658. "Tractatus de Affectuum Pilorum et Unguium;" ibid. 1662. "De Togatorum Valetudine tuendâ Commentarius;" Brux. 1670. The two following are generally aſcribed to this author, though Mangetus and Lipenius (probably miſinterpreting the initial) aſcribe them to Francis Plempius; *viz.* "Munitio Fundamentorum Medicinæ V. F. Plempii adverſus Jacobum Primeroſium;" Amſt. 1659. "Loimographia, ſive, Tractatus de Peſte;" ibid. 1664. Eloy Dict. Hiſt. de la Medecine.

PLENARTY, in *Law*, a term uſed in eccleſiaſtical matters, to denote that a benefice is full, or poſſeſſed of an incumbent.

In which ſenſe it ſtands oppoſed to *vacancy*.

Inſtitution, by ſix months, is a good plenarty againſt a common perſon, but not againſt the king, without induction. See INSTITUTION and INDUCTION.

PLENARY, formed of the Latin *plenarius*, of *plenus*, *full*, ſomething complete, or full. Thus we ſay, the pope grants plenary indulgences, *i. e.* full and entire remiſſions of the penalties due to all ſins.

PLENE ADMINISTRAVIT, in *Law*, is a plea pleaded by an executor or adminiſtrator, where they have adminiſtered the deceaſed's eſtate faithfully and juſtly before the action brought againſt them. On *plene adminiſtravit*, pleaded by an executor, if it be proved that he hath goods in his hands which were the teſtator's, he may give in evidence, that he hath paid to the value of his own money, and need not plead it ſpecially; for when an executor before the action hath paid the money in equal degree with that demanded by the plaintiff, he may plead fully adminiſtered generally, and give the ſpecial matter in evidence. 2 Lill. Abr. 330.

PLENEUF, in *Geography*, a town of France, in the department of the North Coaſts, and chief place of a canton, in the diſtrict of St. Brieuc; 20 miles W.N.W. of Dinan. The place contains 1243, and the canton 6502 inhabitants, on a territory of 115 kiliometres, in 5 communes.

PLENILUNIUM, compounded of *plenus*, and *luna*, in *Aſtronomy*, that phaſis or ſtate of the moon, properly called the *full moon*.

PLENIPOTENTIARY, compounded of *plenus*, *full*, and *potentia*, *power*, a perſon who has full power and commiſſion to do any thing.

The word is chiefly underſtood of the miniſters or ambaſſadors ſent from princes or ſtates to treat of peace, marriages, and other important matters.

The firſt thing done in conferences of peace, is, to examine the power of the plenipotentiaries. See TREATY.

PLENITUDE, PLENITUDO, the quality of a thing that is full, or that fills another.

In phyſic, it is chiefly uſed for a redundancy of blood and humours.

Phyſicians reckon two kinds of plenitude. The one called *ad vires*, when the abundance of the blood oppreſſes the patient's ſtrength.

The other *ad vaſa*, when it fills the veſſels too much; ſwelling them to a degree of burſting.

PLENNA, a word uſed by ſome writers to expreſs any mucous humour.

PLENUM, in *Phyſics*, a term uſed to ſignify that ſtate of things, in which every part of ſpace, or extenſion, is ſuppoſed to be full of matter. It is uſed in oppoſition to a *vacuum*, which is a ſpace ſuppoſed devoid of all matter.

The Carteſians adhere firmly to the doctrine of an abſolute plenum. This they do on this principle, that the eſſence of matter conſiſts in extenſion; and hence, indeed, the conſequence is very eaſy, that wherever there is ſpace or extenſion, there is alſo matter. But this principle we have elſewhere ſhewn to be falſe; and, therefore, the conſequence drawn from it falls to the ground. See MATTER.

That there is a real vacuum, in the nature of things, is likewiſe demonſtrated by arguments *à poſteriori*, under VACUUM.

PLEONASM, PLEONASMUS, formed from πλεονασμος, *q. d. ſuperabundancy*, in *Rhetoric*, a figure of ſpeech, by which we make uſe of words, ſeemingly needleſs or ſuperfluous, in order to expreſs a thought with the greater force and energy.

Such is, *I ſaw it with my own eyes*; or, *he heard it with his own ears*, &c.

The pleonaſm is called by the Latins *redundantia*.

Pleonaſm, by grammarians, is uſually defined a fault in diſcourſe, wherein we ſay more than is neceſſary.

M. Vaugelas will not allow the phraſe, *I ſaw it with my own eyes*, to be a pleonaſm; inaſmuch as there are no ſuperfluous words in it; none but what are neceſſary to give a ſtronger aſſurance of the thing affirmed. It is ſufficient that one of the phraſes ſay ſomewhat more than the other, to avoid the imputation of a pleonaſm.

In effect, though we give the name pleonaſm to any thing that is not neceſſary, or that enters the diſcourſe independently of the ſenſe or conſtruction, yet there are frequently words which, in that view, would be pertinent, and even are uſed to good purpoſe, to give a greater force or grace to diſcourſe, and to aſcertain the truth of what is ſaid.

He ſpoke with his mouth, is a pleonaſm in Engliſh; it is none in Latin: Virgil ſays, *ſic ore locutus*. Some French authors deny *unir enſemble*, *to unite together*, to be a pleonaſm.

PLEROSIS, a word uſed by the old Greeks to expreſs the repletion or reſtoring the body to its natural ſtate, after it has been emaciated by ſickneſs.

PLEROTICS, Πληρωτικα, formed from πληροω, *I fill*, in *Medicine*, a kind of remedies, otherwiſe called *incarnatives*, and *ſarcotics*.

PLES, in *Geography*, a town of Ruſſia, in the government of Koſtrom, on the Volga; 16 miles S. of Koſtrom. N. lat. 57° 15′. E. long. 41° 14′.

PLESHY,

PLESHY, a village and parifh, fituated in the hundred of Dunmow, and county of Effex, England, though now containing, according to the parliamentary returns of 1811, only 46 houfes, and 221 inhabitants, was a place of diftinguifhed confequence in ancient times. Gough and Morant are both of opinion that it was the fcite of a Roman ftation, from the number of urns and Roman bricks which have been dug up here, and from the boldnefs and regularity of the entrenchment furrounding the village. The vallum of this work is ftill very perfect on three fides, and appears to have had four original entrances through it into the inclofed area. Thefe circumftances, however, though plaufible reafons for affigning to Plefhy a Roman origin, are not conclufive evidence. In the Saxon era no mention is made of this place; indeed its authentic hiftory does not commence till the reign of king Stephen, when we are informed that it was vefted in the crown by the king's marriage with Maud, granddaughter of Euftace, earl of Boulogne, by whom it is probable the caftle here was firft erected. Stephen granted it to William de Magnaville, high conftable of England, who procured licence to fortify the caftle from Henry II. Hence we conjecture that he was the perfon who conftructed the foffe, as well as the immenfe keep, which remains to this day a proud monument of the ancient grandeur and ftrength of this once majeftic fortrefs. The keep is oval fhaped, and meafures about 890 feet in circumference, and forty-five paces in breadth at the top.

Humphrey de Bohun, earl of Hereford, having fucceeded to the eftate and honours of the Magnavilles, obtained leave of Edward I. to enlarge his park at Plefhy, by inclofing 150 additional acres. In this family the caftle and manor continued till the year 1372, when Thomas of Woodftock, afterwards duke of Gloucefter, became poffeffed of them, and of the dignity of high conftable, by his marriage with Eleanor, eldeft daughter, and co-heirefs of Humphrey, the laft male heir of the Bohuns. This nobleman, whofe bufy life and tragical fate form confpicuous features in the hiftory of England, was decoyed from the caftle by his nephew, king Richard II., and treacheroufly put to death. Plefhy, after that event, devolved to Edmund, earl of Stafford, in right of Anne, the duke's daughter. It afterwards fell to the crown, and was annexed to the duchy of Lancafter. From that period the caftle feems to have been totally neglected, but the date of its demolition is not mentioned. Leland fays that this place was anciently called Tumbleftoun, and that Plefly is a corruption for Caftel de Placeto. A college for a mafter and eight fecular priefts, two clerks, and two chorifters, was founded here by Thomas of Woodftock in 1393. The original endowments were fubfequently augmented by various benefactors: and at the time of the diffolutions its revenues were valued at 139*l.* 3*s.* 10*d.* *per annum* clear. This houfe was granted by Henry VIII. to fir John Gates, who razed all the old buildings, the college-church excepted, which he however alfo partly deftroyed. It continued in a ruinous ftate till the beginning of the laft century, when bifhop Compton, having been promoted to the fee of London, repaired fuch portions of it as were ftanding, and added a neat body of brick. The principal monuments here are thofe of fir William Jolliffe, knt., and his nephew, Samuel Tuffnell, efq., whofe family here poffeffed the manor for upwards of half a century. Some memorial of the former confequence of Plefhy appears in the election of a mayor annually from among the freeholders of the village, at the court-leet for the manor. This cuftom is fingular, and feems to indicate that Plefhy was at one time a corporate town. Beauties of England and Wales, vol. v., by John Britton and E. W. Brayley, from Morant's "Hiftory, &c. of Effex," folio; and Gough's "Hiftory and Antiquities of Plefhy," 4to.

PLESMONE, a word ufed by the ancients to fignify plenitude or fatiety.

PLESSEVITZA, in *Geography*, a mountain of Croatia; 12 miles N.W. of Bihacs.

PLESSOW, a town of the duchy of Warfaw; 8 miles W. of Kalifch.

PLESTIN, a town of France, in the department of the North Coafts, and chief place of a canton, in the diftrict of Lannion; 7 miles S.W. of Lannion. The place contains 4862, and the canton 9460 inhabitants, on a territory of 105 kiliometres, in 7 communes.

PLESUR, a river of the Grifons, which runs into the Rhine at Coire.

PLESZ, or PLESSE, a town and fortrefs of Silefia, and capital of a lordfhip, in the principality of Ratibor, on the borders of Poland, furrounded with walls, flanked with towers, and containing two churches; 17 miles N.N.E. of Tefchen. N. lat. 49° 57'. E. long. 18° 56'.

PLETCHBERG, a mountain of Switzerland, in the canton of Berne; 22 miles S.S.E. of Thun.

PLETHORA, πληθωρα, in *Medicine*, from πληθω, *impleo*, fullnefs of habit, or an abundance of blood.

Every increafe of the fluids is fometimes called plethora; but the medical authors who fpeak definitely, limit the term to a fuperabundance of good blood. (See Van Swieten, Comment. ad Aph. 106.) This, then, is fcarcely to be confidered as itfelf a difeafe, but a degree of high health, bordering upon difeafe; a condition which predifpofes to difeafe, and renders the perfon liable to be difordered by any exciting caufe, by which the equilibrium of the circulation may be accidentally difturbed.

The mechanical phyficians afcribed many of the morbid actions of the fyftem to plethora; and they remarked, that an abundance of blood was inconvenient to the animal economy in a relative manner only, in different cafes, *viz.* relative to the quantity, to the fpace occupied, to the bulk, and to the patient's ftrength. The firft, plethora *ad molem*, or *ad vafa*, fignified the abfolute over-abundance of blood, as feen by the florid diftention of the minute veffels, and detected by a full, oppreffed, and labouring pulfe. This occurs generally in vigorous conftitutions, where the digeftive powers are ftrong and active, and the wafte from exercife difproportioned to the fupply. The fecond, or plethora *ad fpatium*, is produced when, the quantity of the circulating fluids remaining the fame, the capacity of the veffels is diminifhed; as may be exemplified in the ftate of the circulation in cold weather, or in the cold fit of fevers. The third, or plethora *ad volumen*, implies the contrary condition, or that in which, the quantity remaining the fame, the bulk is augmented, as by external heat, inflammatory difeafes, ftimulating food and drink, violent paffions, &c. The blood, however, is not capable of much expanfion; and both this and the preceding condition are occafioned rather by a change in the diftribution of the blood, than by any actual variation in its condition. By cold, it is driven from the extreme veffels to thofe of the interior; by heat, it is admitted into the relaxed veffels of the external parts. The laft, or plethora *ad vires*, fignifies only a comparative weaknefs of the circulating powers; fo that although the quantity of blood be not fuperabundant, yet it is greater than the veffels are enabled to diftribute freely.

After all thefe refinements of pathology, it will be obvious that there is, in fact, but one kind of actual plethora, which is a real fuperabundance of blood, and is therefore the caufe of a predifpofition to difeafe, efpecially to fevers, to to all inflammatory affections, such as gout and pleurisy, to apoplexy, lethargy, palsy, and the rupture of blood-vessels. This plethoric state is produced by a vigorous digestive power in the stomach, especially in certain constitutions, which possess a lax contexture of the venous system; and its production is favoured by taking copiously of food that is nutritious and easy of digestion, by quietness and composure of mind, by much sleep, and by indolence and inactivity as to muscular exertion. (See Corpulence.) The symptoms by which the existence of this plethoric state are indicated, are thus enumerated by Van Swieten: we know that it is present, he says, if there be a great redness over the whole body, especially where the cuticle is fine and delicate, as in the corners of the eyes, the inside of the eyelids, nose, mouth, lips, and throat; if the veins are distended, and the pulse at the same time is full and strong; and if upon unusual motion, or exposure to heat, or taking of wine, a sense of fullness and distention is felt throughout the body, and this is followed by dullness and drowsiness. Comment. loc. cit.

The cure of this plethoric state is not always easy. Blood-letting is attended with temporary relief; but it is apt to be followed by an increase of the fullness, if other circumstances are not attended to. But with it should be combined a system of diet, more cooling and spare, and of less nutritious substances, of regularity and freedom in the relaxation of the bowels, and a gradual attainment of the power of corporeal exertion, by taking exercise at first by way of gestation, and subsequently by the more active use of the muscles, even by bodily labour, if that prove requisite.

PLETHRON, a Grecian measure, by some said to contain 1444, by others 10,000 square feet. Arbuthnot.

PLETTENBERG, in *Geography*, a town of Germany, in the county of Mark, on the Else and the Oester, governed by its own magistracy. The parish-church belongs in common to the Lutherans and Calvinists. The inhabitants are employed partly in agriculture and breeding of cattle, and partly in the manufacture of coarse cloths and smith's work, particularly scythes; beside other handicrafts; 28 miles S. of Hamm.

Plettenberg's *Bay*, a bay on the S.E. coast of Africa. Cape Seal, at the southern extremity of the bay, is in S. lat. 34° 6'. E. long. 23° 48'. Variation of the compass 27° 12' W. The tide flows at full or change $3^h\ 10^m$, and rises or falls five or six feet perpendicular. This bay scarcely seems capable, by any expence, of being rendered secure, even for small craft, in the winter months; but, in the summer season, ships may remain without any danger. Westward of this bay, at the distance of about eighteen miles, is *Knysna*, which see. Plettenberg's bay is a division of the district of Zwellendam, which begins at the Kayman's river, and continues to the inaccessible forests of Sitsikamma. The whole of this tract of country is very beautiful, agreeably diversified by hill and dale, and lofty forests. Within seven miles of the bay are large timber-trees, and the surface is almost as level as a bowling-green, over which the several roads are carried. The peasantry who inhabit this district are mostly wood-cutters, who earn a very hard subsistence. The great distance from the Cape of Good Hope, being 400 miles of bad road, allows them little profit on a load of timber, when sold at the dearest rate in the Cape market, so that they prefer disposing of it at the bay for a mere trifle. Plank of thirteen or fourteen inches in width, and an inch thick, may be purchased on the spot at the rate of 3*d. per* foot in length. The bark of several of the creeping plants in the forest might be employed as substitutes for hemp: and the iron ores, near the base of the mountain, might be worked by clearing away the wood, of which there is an inexhaustible supply. Barrow's Africa, vol. ii.

PLETZDORF, a town of Bavaria, in the bishopric of Bamberg; six miles W.N.W. of Burg Eberach.

PLETZKY, a town of Saxony; two miles W. of Gommern.

PLEVEN, a town of European Turkey, in Bulgaria, on the Vid; 28 miles S. of Nicopoli.

PLEUGLIA, a town of European Turkey, in Servia; 40 miles W. of Jembasar.

PLEVIN, Plevina, in *Law*, a warrant or assurance, the same with pledge. See Pledge, Replevin, &c.

PLEUMANGAT, in *Geography*, a town of France, in the department of the North Coasts; 13 miles S.S.W. of Dinan.

PLEUMARTIN, a town of France, in the department of the Vienne, and chief place of a canton, in the district of Chatellerault. The place contains 1205, and the canton 7143 inhabitants, on a territory of 280 kiliometres, in 12 communes.

PLEUMAUDAN, a town of France, in the department of the North Coasts; six miles S.S.W. of Dinan.

PLEUNOS, a town of Africa, in Barea. N. lat. 31° 40'. E. long. 25° 20'.

PLEURA, in *Anatomy*, the serous membrane, which lines the cavity of the thorax. See Lung.

PLEURISY, Pleuritis, in *Medicine*, an inflammation of the *pleura*, or membrane surrounding the lungs.

The pleurisy has been generally distinguished by medical writers from the peripneumony, or inflammation of the substance of the lungs; by the greater acuteness of the pain in the side, increased on inspiration, the greater hardness and strength of the pulse, the dryness of the cough, and the greater violence of the fever. It is in fact, however, only a modification of the same disease with the peripneumony; whence Dr. Cullen gave the same generic name *pneumonia* to both. We shall, therefore, refer the reader to the former article, where all the modifications of pneumonic inflammation are discussed at length. See Peripneumony.

PLEURITIS, the pleurisy.

PLEUROCYSTUS, in *Natural History*, the name of one of the general arrangements of the echini marini.

The word is derived from the Greek πλευρον, *the side*, and κυστος, *the anus*.

The echini of this division are distinguished from the others, by having their anus neither on the summit, nor in any part of the base, but in some part of the superficies of one of the sides.

PLEURODYNE, in *Medicine*, from *pleura* and ὀδυνη, *pain*, signifies a pain of the side, independent of inflammation, as *pleuritis* denotes the pain arising from inflammation.

A stitch or pain in the side often occurs, independently of any acute inflammation of the lungs, pleura, or contiguous organs, and it is generally increased by the action of breathing. It has been often denominated a false or *spurious pleurisy*. The pain, however, is seldom seated in the membrane called the *pleura*, but often in the muscles of the chest, sometimes in the other membranous parts; and it may arise from rheumatism affecting those parts, from spasm or cramp, from a plethoric condition, or from a nervous and hysterical state, in which the circulation is languid and irregular: it may also be connected with a gouty, syphilitic, or scorbutic habit. Sauvages has distributed the pleurodyne into eighteen species, according to its origin from one or other of these causes. (See his Nosol. Method. class v. gen. ii.) The term is now most commonly applied to *rheumatic* pains affecting the muscles of the ribs and the diaphragm. See Rheumatism.

PLEURON, in *Ancient Geography*, the name of two towns

towns in Ætolia, the *Old* and the *New*; the former ſituated near Calyon, and the latter near mount Aracynthus.

PLEURONECTES, in *Ichthyology*, a genus of fiſhes of the order Thoracici, of which the generic character is; head ſmall; eyes ſpherical, both on the ſame ſide of the head, and near each other; mouth arched; jaws unequal, toothed; gill-membrane with from four to ſeven rays; the cover generally of three laminæ; the body is convex and coloured above; flat and paler beneath; the vent is nearer the head.

This genus, which conſiſts of about thirty ſpecies, comprehends thoſe which are denominated flat-fiſh. The ſtructure of this fiſh is conſidered as one of the moſt curious deviations from the general uniformity or regularity obſerved by nature in the external figure of animals, in which, with a few exceptions, both ſides of the body are perfectly ſimilar: but in the genus Pleuronectes, the animal is ſo conſtituted, that one ſide appears to repreſent the back, and the oppoſite ſide the abdomen. They ſwim obliquely or on their ſides, and the two eyes are always placed on one ſide, and it is from this circumſtance that the ſections into which the ſpecies are divided, are conſtituted; that is, according as the eyes are on the right or the left ſide. The fiſh of this genus reſide at or near the bottom of the water, owing to their having no air-bladder: they often bury themſelves in the ſand as far as the head, by which means they eſcape the jaws of the more rapacious tribes; the eyes are covered with a nictitant membrane; the noſtrils are double and contiguous; the belly is without ribs; the fins are ſoft, and moſtly with ſimple rays; the ventral and pectoral long, the tail generally rounded, with bifid rays.

A. *Eyes both on the right Side of the Head.*

Trichodactylus. Body rough; pectoral fins filiform. This is only known from the deſcription of Artedi, who ſays that it is rough, of a grey colour, with duſky variegations. It is a native of the Indian ſeas, and found about Amboina.

Zebra. Body with numerous tranſverſe bands. This is reckoned a very elegant ſpecies, and readily diſtinguiſhable by its colours, the upper part being white, with a browniſh caſt towards the back, and marked from head to tail by numerous, double, deep brown, tranſverſe bands, paſſing acroſs the fins themſelves. It is rather larger than the common ſole. It is a native of the Indian ſeas, and in conſiderable eſteem as an article of food.

Plagiusa. Body oblong, ſomewhat rough; dorſal and anal fins joined to the tail. It inhabits Carolina; the body is pale and cinereous.

Ocellatus. Body with four dark brown ocellate ſpots; the irids are white. Found in the ſea about Surinam.

* Hippoglossus; Holibut. The body of this ſpecies is perfectly ſmooth; the tail is lunate. This ſpecies not only exceeds in ſize all the reſt of the preſent genus, but may be conſidered as one of the largeſt of fiſhes, properly ſo called, having been found of the weight of three or four hundred pounds. It is a native of the Mediterranean and Northern ſeas, but appears to arrive at its greateſt ſize in the latter: it is the moſt voracious of the whole tribe, preying on a variety of other fiſhes, as well as upon different kinds of crabs, ſhell-fiſh, &c. It is of a longer or more ſlender form than moſt other flat-fiſh. It is not much regarded as an article of food.

Cynoglossus. Body oblong, ſmooth; teeth obtuſe; tail a little rounded. It is extremely allied to the preceding, and has been regarded rather as a variety than a diſtinct ſpecies.

It is a native of the Northern ſeas, and found in conſiderable numbers in deep bays about the coaſts of Greenland.

* Platessa; Plaiſe. Body ſmooth; behind the left eye there is a row of ſix tubercles reaching to the lateral line. The plaiſe is eaſily diſtinguiſhed from the others of the genus by its ſhape and colours, being very broad and flat; of a fine paliſh brown above, marked both on the body and fins by pretty numerous orange-coloured ſpots; the under ſide is white. It is an inhabitant of the Mediterranean, the Baltic, and Northern ſeas, and is found in conſiderable plenty about our own coaſts. The fleſh is very good, eſpecially of thoſe that run to a large ſize.

* Flessus; Flounder. Lateral line rough; ſhort ſpines on the right ſide of the fins. The flounder is an inhabitant of the ſame ſeas as thoſe in which the plaiſe is found. It is extremely common about our own coaſts, and frequents our rivers at a conſiderable diſtance from the ſalt waters; it is in conſiderable eſteem as food, and great quantities are brought to the London markets.

* Roseus; Roſe-coloured Flounder. Body roſy; fins pale yellow-brown. It is frequently taken in the Thames.

* Limanda; Dab. Scales very ſmall, ciliate; ſpinules at the root of the dorſal and anal fins with obtuſe teeth. It inhabits the European ſeas; is leſs and thinner than the flounder; feeds on worms and inſects, eſpecially ſmall crabs; it ſpawns in June; the fleſh is reckoned very good.

* Lævis; Smear-dab. Brown, with obſcure yellow ſpots, beneath white, with five large duſky ſpots; ſcales ſmooth; the dorſal fin has ſeventy-nine rays. It is about eighteen inches long, and the fleſh is reckoned good for food.

Limandoides. Body oblong, rough; lateral line ſtraight, broad. It is found in the Northern ſeas; it reſembles the plaiſe; the fleſh is very good.

Solea; Sole. Body oblong, rough; the upper jaw is longer. The ſole is an inhabitant of the Northern, Baltic, Mediterranean, and American ſeas, and grows to the length of two feet or more, and to the weight of ſix or eight pounds; its general ſize is, however, very much ſmaller. It is covered with ſmall rough ſcales of an oblong form, each terminated by numerous ſpines, and very ſtrongly faſtened to the ſkin. Theſe ſcales, from the elegance of their ſtructure, have long ſince formed objects for the microſcope; an erroneous idea ſometimes prevails that the ſpiny end of the ſcale is that by which it is inſerted into the ſkin. This fiſh delights in lying at the bottom of the coaſts which it frequents, preying on ſmall ſhell-fiſh, ſpawn, ſea-inſects, &c.: it is generally taken by the trawl-net. The chief fiſhery is ſaid to be at Brixham, in Torbay.

* Arnoglossus; Smooth Sole. Thin, pellucid, white, ſmooth. It is found, though but ſeldom, on the coaſts of Cornwall.

Linguatula. Vent on the left ſide; the teeth are very ſharp.

Glacialis. Very ſmooth; above brown, beneath white; middle rays of the dorſal and anal fins rough, with ſmall ſpines. It inhabits ſandy places in the Frozen ſea, and is about nine inches long.

Platessoides. Body above with brown ſpots. It inhabits ſandy places in the mouths of rivers in Greenland; it is ſcarcely a foot long; feeds on ſmall worms and fiſh; in *ſhape* it reſembles the R. linguatula; in its *ſcales*, the ſole; and in its *ſpots*, the plaiſe.

B. *Eyes both on the left Side of the Head.*

Lineatus. Body rough, barred with black; it has no pectoral fins. It inhabits North America.

Bilineatus.

Bilineatus. Lateral line double, and alfo without pectoral fins. It is a native of China.

Punctatus. Body broad and very rough. It inhabits the deep fandy places of the Northern fea. It is reckoned a great delicacy in Denmark.

* Rhombus; Pearl. Body fmooth. It is found in European feas, and is the broadeft of its fize, except the turbot; the body is covered with fmall fcales, deep brown, with dirty yellow fpots, beneath white; the flefh is very good, but inferior to the turbot defcribed below.

Dentatus. Body oblong, fmooth; teeth extending out of the mouth. It inhabits Carolina.

* Maximus; the Turbot. Body rough. This fine fifh, fo highly prized by epicures, inhabits the European and Mediterranean feas: grows fometimes to thirty pounds weight; it is very voracious, and feeds on infects, worms, and teftaceous animals; the body is fquarer than any other fpecies; it is covered with obtufe, unequal, fpinous tubercles; above it is brown, varied with yellow; beneath it is white, fpotted with brown; the flefh is firm and excellent. For the method of catching turbot, fee the article Turbot.

* Passer; Whiff. Lateral line much curved, prickly. It is a native of European feas, and is about a foot long; the flefh is good.

Papillosus. Lateral line curved; body papillous. It inhabits America, and is fuppofed to be a variety of the laft.

Mancus. Head tuberculate; pectoral fins unequal. It inhabits the fandy bottoms of the Brafil and Pacific feas.

Argus. Body variegated; tail rounded; jaws equal. It is found in the neighbourhood of the Caribbee iflands; the body is covered with fmall foft fcales, and variegated with yellow fpots, which are dotted with brown, and edged with blue; the body is fprinkled with brown points.

Lunatus. Body with fcattered, blue, half ocellate fpots. It is a native of the North American feas; the tail is lunate.

Japonicus. Tongue rough. It is a native of the Japan feas. It is about fix inches long; the colour is brownifh above, and whitifh beneath; rays of the dorfal and anal fin fo extremely numerous as to be counted with difficulty.

PLEURO-PERIPNEUMONY, or Pleuro-pneumony, in *Medicine*, a term employed to denote the moft common form of pulmonary inflammation, in which both the pleura and the lungs are involved in the difeafe at the fame time. See Peripneumony.

PLEURORTHNOPŒA, a term ufed by medical writers to exprefs that kind of pleurify in which the patient cannot breathe, unlefs in an erect pofture.

PLEUROTHALLIS, in *Botany*, from πλευρα, *the fide*, and θαλλος, *a bough* or *frond*, apparently in allufion to the lateral infertion of the inflorefcence, the whole plant often confifting of but a fimple leaf with its ftalk; and at the fide, where both unite, the flowers are produced.—Brown MSS. Ait. Hort. Kew. v. 5. 211.—Clafs and order, *Gynandria Monogynia*. Nat. Ord. *Orchideæ*.

Eff. Ch. Lip of the nectary connected, by a joint, with the bafe of the column. Two lower calyx-leaves combined underneath. Maffes of pollen two, without a furrow. *Br.*

1. P. *rufcifolia*. Butcher's-broom leaved Pleurothallis. (Dendrobium rufcifolium; Swartz Orchid. 94. Willd. Sp. Pl. v. 4. 135. Epidendrum rufcifolium; Jacq. Amer. 226. t. 133. f. 3. Linn. Sp. Pl. 1353. Helleborine rufci majoris folio; Plum. Ic. 171. t. 176. f. 2.)—Stem elongated. Leaf folitary, ovato-lanceolate. Flowers aggregate, at the bafe of the leaf.—Native of woods in the Weft Indies. It flowers in the ftove in May and June. The perennial *roots* confift of numerous long fimple fibres, growing parafitically on the branches or ftems of trees. *Plants* feveral, about a fpan high, forming a tuft, like fmall lilies of the valley, but the *flowers* are not much elevated. Their form we have not had an opportunity of feeing.—We prefume the two other fpecies in Plumier's tab. 176, belong to the fame genus; but the above is alone mentioned in Hort. Kew.

PLEURS, Plurs, or *Piuro*, in *Geography*, a town of Switzerland, which was formerly large and flourifhing, and fubject, as well as Chiavenna, to the Grifons. It is faid to have contained three churches, many large houfes, and a ftone bridge over the Maria, and that its population amounted to at leaft 1500 inhabitants, who carried on no inconfiderable commerce. But it was totally overwhelmed by the fall of mount Conto, which terrible cataftrophe happened on the 25th of Auguft, 1618. The valley in which it was fituated is very narrow, and the whole town was buried in one undiftinguifhed ruin. A contemporary account relates, that the cloud of duft and rubbifh was fo great as to cover the heavens like fmoke, and even to extend as far as Chiavenna; the inhabitants of which place, alarmed at the phenomenon, were ftill more terrified at the fudden difappearance of the river Maria, the courfe of which was ftopped by the fallen fragments of rock, and apprehenfive that the torrent had undermined Chiavenna, they precipitately fled in great numbers to the mountains. A part of the ancient walls, and the ruins of a country houfe, belonging to the richeft family in the place, are the only remains of its former exiftence.

PLEURTUIT, a town of France, in the department of the Ille and Villaine, and chief place of a canton, in the diftrict of St. Malo. The place contains 6596, and the canton 10,973 inhabitants, on a territory of 75 kiliometres, in 4 communes.

PLEUVAULT, a town of France, in the department of the Côte d'Or; 12 miles S.E. of Dijon.

PLEXUS, in *Anatomy*, a term applied to various parts of the body, and particularly where feveral nerves or blood-veffels are united together. The plexus choroides is fituated in the lateral ventricle of the brain. (See Brain.) The plexus pampiniformis is made up of the ramifications and unions of the fpermatic veffels. (See Generation.) In the nervous fyftem plexufes are frequent, particularly in the great fympathetic. See Nervous *Syftem*.

PLEYBEN, in *Geography*, a town of France, in the department of Finifterre, and chief place of a canton, in the diftrict of Chateaulin; five miles N.E. of it. The place contains 3972, and the canton 14,404 inhabitants, on a territory of 375 kiliometres, in 9 communes.

PLEYBERG, a town of the duchy of Carinthia, formerly called "Auffenftein;" 20 miles E. of Clagenfurt.

PLIANT *Mealy Tree*, in *Gardening*, a common tree in plantations. See Viburnum.

PLICA, in *Medicine*, commonly mentioned with the epithet *Polonica*, becaufe the difeafe is endemic in Poland, and the neighbouring countries, is an affection of the hair, which becomes matted together, and thickened, fo as to form maffes which cannot be unravelled, in confequence of the depofition of a morbid matter in and about the hair.

The difeafe is called *Koltum*, or *Koltek*, in Poland; and by the Germans *Weichfel-zopff*, on account of its prevalence in the region watered by the Weichfel, or Viftula. Sauvages and the nofologifts have denominated it *Trichoma*. As the difeafe is never feen in this country, except by the accidental vifit of a perfon affected with it from the country where

where it prevails, we can only defcribe it after the writers who have witneffed it. The moft clear and concife account of it is given by M. de la Fontaine, furgeon at Warfaw, in his furgical and medical treatifes on various fubjects refpecting Poland, publifhed in German, from which we fhall extract the following hiftory.

The fymptoms which precede the morbid affection of the hair are very various, and often put on the appearance of other difeafes. Thus pfeudo-rheumatic pains are fometimes the antecedents of the malady: and it is faid that apoplexy, mania, and various nervous difeafes are apt to occur, as well as inflammations, particularly of the eyes, indurations of the glands, gangrene, and caries, more particularly of the nafal bones and cranium. Sometimes, however, the *plica* comes on without any previous fymptom, even in the courfe of one night; and violent paffions of the mind, efpecially rage and terror, are faid to have caufed it inftantaneoufly. The moft common fymptoms of its approach are, a fenfe of weight and torpidity in all the limbs, pains in the back, giddinefs, difficulty of breathing, ringing in the ears, with an increafed fecretion of cerumen, dull pains in the orbits of the eyes and lacrymal glands, with an augmented flow of tears, head-ache, violent itching and prickling in the hairy fcalp, pain in the præcordia, and depreffion of fpirits. In many patients there is a remarkable change in the appetite, a craving for fpirituous liquors, and for new and ftrange kinds of food, while they loathe the things which they ufed to relifh moft. But the moft certain figns that a plica will foon be formed, are clammy fweats about the head, with a diminution of pains, and a fenfation of tightnefs, as if the upper parts of the head were drawn together.

The hairs now begin to grow greafy, and emit a remarkably difagreeable fmell. The patient has frequent alternations of fhivering and heat, and feels an unpleafant prickling cold under his nails. Under thefe circumftances, a fort of crifis takes place, upon the depofition of the morbid matter upon the hair and nails, and the fymptoms of ill health immediately difappear, except in fome rare cafes, where a new depofition is to take place, and the crifis is therefore imperfect. The matter is depofited in the hairs, and fometimes in greater quantity than they can contain; they then burft, and a prodigious quantity is poured out between them, glueing them together. It is not true, that the hairs extend fo much that blood flows out of them, as has been affirmed, or that they bleed on being cut. Occafionally the matter is not only depofited in the hairy fcalp, but upon the hair of the pubis, of the arm-pits, or upon the nails. If the fymptoms continue, a fecond plica will certainly be formed, but not until the firft has feparated from the head, and new hair has grown: it is never certain, however, that a fecond will not be formed; for the difeafe often takes on a kind of periodic form. A conftant fenfe of cold about the head, and particularly at the temples, is a fure fign of its returning.

Sometimes the whole matter is depofited in one half of the hair, the other half remaining found: in which cafes, the previous fymptoms attack only one fide of the body. The peculiar form of the matting depends upon the previous fafhion of the hair: moft of the men cut it fhort, while the women, on the contrary, have uncommonly long and beautiful hair. The morbid matter is firft depofited in the rete Malpighii, from whence it penetrates into the hair, fometimes flowly, fometimes rapidly. The moifture oozing out from the hairs bind them fo together, that it is impoffible to feparate them again: if the whole hair be affected, it forms a kind of cap; if it flow out more partially, feveral tails or rope-like plicæ are produced. Some days after the mafs of difeafe has been formed, it begins to emit an odour like that of rancid fat; and when it is touched, it excites a pricking unpleafant fenfation in the fingers. M. Fontaine diffected a patient, in whom the plica had come on juft before death, and he found the bulbs of the hair larger than natural, from which he preffed out a pale yellow clammy mucus. In another, in whom the plica was already old, he found nothing remarkable. The plica is apt to be productive of prodigious numbers of lice, from which the patient fuffers even more than from the difeafe.

All writers have divided the *plica* into feveral fpecies, according to the various forms which it affumes. Sauvages has defcribed three fpecies. 1. *Trichoma cirrofum*, or what the French call *plique en cordons*, is the moft common form, when it appears in long tails or cords, as before mentioned. It was called abfurdly enough by Schultz, plica *mas*, or the male plica. 2. *Trichoma villofum*, the plica *femina* of Schultz, when the difeafe is more generally diffufed. And 3. The *Trichoma Polonicum*, when it fuddenly extends to a great fize, and forms a cap over the head. M. Alibert, in the treatife "Sur les Maladies de la Peau," which he is now conducting, has alfo divided *la plique* into three fpecies, and points out feveral varieties under each. His firft is Plique *multiforme*, or Plica *caput-medufæ*, which applies to the tail-like or ferpentine agglutinations, which may not be inaptly compared to the fabulous head of Medufa. His fecond fpecies is Plique *à queue*, ou *folitaire*, or Plica *longi-cauda*, in which the plicæ are not divided, as in the former fpecies, but reunite and form one tail-like mafs, not unlike the tail of a quadruped, often acquiring a great length. And his third is Plique *en maffe*, or Plica *cefpitofa*, in which a conglomerated mafs is formed over the head, without any tail-like divifions. Thefe arbitrary claffifications afford at leaft fome diftinct notion of the varieties of appearance which the difeafe affumes.

The proximate caufe of the plica, according to M. de la Fontaine, is a peculiar morbid matter, which is clammy and acrid, has its feat in the lymph, and is depofited critically upon the hair or nails. When it is depofited upon the nails, either of the hands or the feet, they become larger, thicker, prominent, deformed, horny, and ill-coloured, but not black.

The exciting caufes are altogether uncertain; for neither the air, water, nor food, feems to have any influence in producing it; nor are cleanlinefs and regular combing the hair any defence againft it. Experience fhews, however, that it is a contagious difeafe, and very often congenital; at the fame time, thofe to whom it is communicated by contact are faid to have it flightly, and to be eafily cured. It fpares no fex, age, or condition, nor even newly arrived ftrangers, and fome infants bring it into the world with them: the lower claffes of the people, however, fuffer moft from it; and thofe who have foft brown hair are moft frequently affected, though no colour efcapes. The plica is never white; but when it drops off in old people, it is fometimes fucceeded by white hairs. Poles, who travel, are fometimes affected with it in other countries, and even their children. There is no accurate hiftory of its origin: the Greeks, Romans, and Arabians have not mentioned the difeafe; but fome modern writers affirm that it was imported from Tartary in the year 1387. It now prevails in Tartary, White and Red Ruffia, Lithuania, and from the fource of the Viftula to the Carpathian mountains; but is more frequent in fome diftricts than in others.

The method of cure recommended for plica varies with the circumftances of the cafe. When fever is prefent, moderate evacuations

evacuations muſt be reſorted to; but blood-letting is to be employed with great caution. M. de la Fontaine compares the diſeaſe with the ſmall-pox, in which, when the febrile action is too feeble to produce the eruption, it muſt be increaſed; when it is too violent, it muſt be diminiſhed. Hence the patient muſt be, in ſome inſtances, ſupported by generous diet; while, in others, a ſpare regimen muſt be adopted. In order to bring about the criſis, the ſame writer recommends the uſe of ſudorifics, and appears, indeed, to conſider antimony as a ſpecific in this diſeaſe. The older phyſicians praiſe the lycopodium as poſſeſſed of ſpecific powers, but without any good grounds; and the common people believe in a great number of ſpecific remedies, but the diſeaſe has not become leſs frequent, notwithſtanding theſe ſuppoſed means of cure. Mercurials, eſpecially when carried to the extent of exciting ſalivation, are ſaid to be highly detrimental in every caſe; but if the diſeaſe be complicated with ſyphilis, the corroſive muriate of mercury is very beneficial.

External remedies are almoſt always neceſſary; ſuch as the application of warmth to the head, in the form of vapour, warm bath, or fomentations made with the decoctions of various plants: a decoction of ſoap is eſteemed beneficial when the head-ache is ſevere. Sinapiſms and bliſters are likewiſe applied with advantage. The plica may, or may not, be cut off according to circumſtances. After a complete criſis, it ſeparates from the head, and remains attached only by ſound hair. This may take place in a few days, weeks, or months. If it has loſt its peculiar ſmell and greaſy appearance, has become dry, and all concomitant ſymptoms have ceaſed, it may be cut off by dividing the ſound hair: for it is remarkable, that even an old plica cannot be cut in the middle without giving pain. The new hair may be waſhed with warm water, and combed out. If, however, the plica be new, ſit faſt on the head, cauſe a prickling in the fingers when touched, and the general ſymptoms have not ſubſided, it muſt not on any account be cut off. The moſt dreadful accidents often immediately enſue from ſuch practice. Some have become inſtantly blind, or have died from apoplexy, or in epileptic convulſions. The people are ſo much afraid of this, that they will ſeldom permit the plica to be cut off, even when it may be done with ſafety. If bad conſequences follow the cutting off of the plica, the moſt certain and ſpeedy remedy is to apply it in its former ſituation. This muſt be done before it becomes dry; and it is almoſt incredible, ſays M. de la Fontaine, that, after one, two, three, or more days, it will again adhere to the head. He does not maintain that it grows to the ſtumps of the hair; but that innumerable examples prove, that a kind of callus is formed, as in a fractured bone. If the plica be not brought to adhere again, the patient, if he ſurvive, remains exceſſively ſick, until the hair grow, and a new plica be formed. The Jews, who are bigotted to their own cuſtoms and methods of cure, never permit it to be cut off, and nothing can be more diſguſting than one whoſe beard and whiſkers are affected with this diſeaſe.

If the morbid matter be depoſited on the ſurface of the body, it is ſaid to occaſion malignant and obſtinate ſores, which give a great deal of trouble. If it have a tendency to depoſit itſelf in the nails, it muſt be encouraged by the application of ſtimulants, ſuch as tincture of cantharides, bliſters, or by touching a freſh plica with the fingers. The nails do not ſeparate ſo readily as the hair, and can only be ſafely cut off when new nails have begun to grow; and this often does not happen. The Poles believe, that keeping their hair ſhort, or even ſhaving the head, is a preſervative againſt this diſeaſe; but, on the contrary, the men ſuffer much more than the women, whoſe hair is long; and it at laſt affects the hair on other parts of the body.

M. de la Fontaine recommends a mild, attenuant, and corrective diet, as in other diſeaſes proceeding from acrimony of the fluids, with the uſe of ripe fruits. The correctneſs of his advice, however, may be juſtly queſtioned, ſince he informs us, that the diet of the common people in Poland conſiſts almoſt, if not entirely, of vegetables, which are generally made ſour. He concludes by this ſingular obſervation, that, if all theſe means be inadequate to produce the criſis, *inoculation* of the diſeaſe will often effect it; and that this is performed by putting on a cap, which has juſt been worn by one who has a recent plica. See Duncan's Annals of Medicine, vol. i. ſect. 1. Haller, Diſputationes Med. tom. i. art. 16, 17. Alibert, Précis Theorique et Pratique ſur les Maladies de la Peau, p. 92, et ſeq. Memoirs of the Literary and Philoſophical Society of Mancheſter, vol. iv. part 2.

Plica, Lat. a pleat, a fold, a wrinkle, the name of a muſical character in the firſt time-table that was formed. It was a kind of ligature, or retardation (*ſignum moroſitatis*, ſays de Muris); it ſerved for a ſeries of notes in paſſing from one ſound to another by regular degrees from a ſemitone to a 5th aſcending, and deſcending: it was of four kinds: 1. The long plica aſcending, a ſquare figure with one ſingle ſtroke or tail aſcending, . 2. The long plica deſcending has two ſtrokes or tails, one longer than the other, . 3. The ſhort plica aſcending has a ſingle tail on the left ſide turned up, . The 4th plica has a ſingle tail on the left ſide deſcending, .

PLICARIA, in *Botany*, a name uſed by ſome for the club-moſs.

PLICATED Leaf. See Leaf.

PLIGHT, in our old *Law Books*, a term which ſignifies the eſtate, with the quality of the land; though ſometimes it extends alſo to the rent-charge, and the poſſibility of a dower. Coke's Inſt. fol. 221.

PLINIA, in *Botany*, ſo named by Plumier, in memory of the famous Roman naturaliſt; ſee Pliny. Plum. Gen. 9. t. 11. Linn. Gen. 270. Schreb. 337. Willd. Sp. Pl. v. 2. 998. Mart. Mill. Dict. v. 3. Juſſ. 342. Lamarck Illuſtr. t. 428.—Claſs and order, *Icoſandria Monogynia*. Nat. Ord. *Heſperideæ*, Linn. *Roſaceis affine*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, ſmall, of one leaf, flat, in five acute reflexed ſegments. *Cor.* Petals five, ovate, concave, widely ſpreading. *Stam.* Filaments twenty, inſerted into the calyx, capillary, longer than the corolla; anthers globoſe. *Piſt.* Germen ſuperior, roundiſh; ſtyle awl-ſhaped, wavy; ſtigma ſimple. *Peric.* Drupa globoſe, furrowed, of one cell. *Seed.* Nut ſolitary, large, ovate, rough, cloven at the ſummit.

Eſſ. Ch. Calyx in five ſegments. Petals five. Drupa ſuperior, furrowed. Nut rough.

Obſ. Every botaniſt, who has attended, in any manner, to the ſubject, is aware of the great obſcurity that envelops this genus, which depends chiefly on the authority of Plumier, and which no ſucceeding botaniſt has been able to verify; except perhaps Allamand, from whoſe communications Linnæus corrected the generic character as above. Some have ſuppoſed Plumier to have been totally miſtaken, as to the germen being ſuperior, and that *Plinia* is no other than

than an *Eugenia.* Linnæus, and Allamand poffibly, confounded thefe genera in their ideas; for their *P. rubra* is, as every body knows, *Eugenia uniflora.* See Willd. Sp. Pl. v. 2. 962, where its multifarious fynonyms are correctly ftated; fee alfo our article EUGENIA. We fubjoin all we can find upon record of the original and only fpecies of *Plinia,* of which we have never been fo fortunate as to fee a fpecimen.

1. P. *crocea.* Orange-fruited Plinia. Linn. Mant. 244. Willd. n. 1. (P. pinnata; Linn. Sp. Pl. ed. 1. 516. ed. 2. 735. P. pentapetala; Linn. Mant. 402. P. fructu croceo, odorato; Plum. Ic. 219. t. 225.) By Plumier's figure, which is our only guide, this appears to be a *tree,* with round alternate *branches.* The *leaves* are oppofite, nearly feffile, ovate, pointed, entire, about three inches long and one broad, apparently fmooth, with one rib, and many tranfverfe incurved veins. *Flowers* fcattered over the larger branches, nearly feffile, folitary, fcarcely fo big as a hawthorn bloffom, the tapering *ftyle* projecting beyond the numerous *ftamens,* which are themfelves longer than the *petals. Fruit* globular, faffron-coloured and fragrant, according to Plumier, the fize of a large goofeberry, deeply furrowed and wrinkled. *Nut* more flightly furrowed, or rather quite globular and only ftriated, large, with a thin fhell, and full kernel.

Burmann, the editor of Plumier, mifconceived the *leaves* to be abruptly pinnate, taking the whole branch for a leaf. Linnæus adopted this error, and having once made a falfe ftep, he floundered deeper and deeper in trying to correct himfelf, altering the fpecific name time after time, and contrafting the plant with one of a different genus; into which laft miftake he was indeed led by his correfpondent Allamand. We do not prefume to throw any new light on this obfcure point of botanical hiftory, but what we have collected may ferve to affift thofe who may be fo fortunate as to meet, in fome part of the Weft Indies or of South America, with the plant Plumier defcribed. Dr. Swartz, who inveftigated the former with great induftry, feems never to have feen the *Plinia;* nor has he, in his *Obfervationes Botanicæ,* 203, done more than indicate the generic confufion, to which we have fufficiently adverted.

PLINIA, in *Gardening,* comprifes a plant of the exotic fhrubby kind for the ftove, of which the fpecies cultivated is the red-fruited plinia, or myrtle (P. pedunculata.)

Method of Culture.—It is increafed by the feeds, which fhould be procured from abroad, and which fhould be fown in pots, filled with rich mould, plunging them in a bark hotbed, when they appear in the fame feafon. They may alfo be increafed by planting cuttings of the young fhoots, in the later fpring and fummer months, in pots filled with good earth, covering them with hand or bell-glaffes, and watering them occafionally. They may be fo rooted as to be fit for removing into feparate pots the fame year.

It is a plant highly ornamental in ftove collections, from its flowering in the winter feafon.

PLINIANA, in *Geography,* a town or rather village of Italy, in the department of the Lario; fix miles N. of Como. This place is remarkable for a fingular fountain, which is ftill to be feen in the fame ftate as defcribed by Pliny, lib. iv. ep. 30. This fpring burfts from a rock, and falls in natural cafcades into the lake of Como. It ebbs and flows three times a day; gradually rifing until it forms a confiderable ftream, and then as gradually fubfiding till it becomes almoft dry.

PLINLIMMON, a mountain of Wales, in the N. part of the county of Cardigan, on the borders of Montgomeryfhire.

PLINTH, from πλινθος, *brick,* in *Architecture,* a flat fquare member, in form of a brick: fometimes, alfo, called the flipper.

The plinth is ufed as the foot, or foundation of columns: being that flat fquare table, under the mouldings of the bafe and pedeftal, at the bottom of the whole order; feeming to have been originally intended to keep the bottom of the primitive wooden pillars from rotting.

The plinth is alfo called the *orle* or *orlo.*

Vitruvius alfo calls the Tufcan abacus, plinth, from its refembling a fquare brick.

PLINTH *of a Statue,* &c. is a bafe or ftand, either flat, round, or fquare, ferving to fupport a ftatue, &c.

PLINTH *of a Wall,* is a term for two or three rows of bricks advancing out from the wall; or in the general for any flat high moulding, ferving in a front wall to mark the floors; or to fuftain the eaves of a wall, and the larmier of a chimney.

PLINTHITIS, a kind of alum found in fome of the iflands of the Archipelago, and called alfo *placitis,* from its ufually being found in thin cakes.

PLINTHIUM, a name given by the ancients to a machine invented for the making extenfion of diflocated or fractured limbs. Oribafius defcribes feveral kinds.

PLINY, the elder, CAIUS PLINIUS SECUNDUS, in *Biography,* a diftinguifhed Roman writer, was born, it is thought, at Verona, in the reign of Tiberius, A.D. 23. He was defcended from an illuftrious family, and ferved in the army during the wars in Germany. He rofe to various public employments under the emperors Nero, Vefpafian, and Titus. It is faid that there is fcarcely a man of bufinefs who was fo devoted to ftudy, or comprehended fuch an extent of literary refearch. The following is the mode of his fpending his time at Rome, when he was high in the poffeffion of the imperial favour. Before day-break he waited upon Vefpafian, who was alfo an early rifer, and then proceeded to execute the emperor's orders. On returning home he employed the reft of the day in ftudy. After taking a light repaft, he reclined in the fun according to the Roman cuftom, while a book was read to him, from which he took notes. He never perufed any work without making extracts, as he was accuftomed to fay "that no book was fo bad as not to afford fomething valuable." He then bathed, flumbered a little, and rifing frefh, as if to a new day, ftudied till fupper time. Even during that repaft a reader was at his fide, as there was upon all his journies; and a vacant hour never occurred which he did not employ in reading and writing. Of his avarice of time, his nephew, the younger Pliny, gives the following inftance: one of his friends having obliged the reader to repeat fomething that he had pronounced improperly, "Did you underftand him?" faid Pliny, "I did," he replied. "Why then did you ftop him? We have loft more than ten lines by the interruption." He always went from place to place in a fedan, that he might read on his road, and reproved his nephew for walking as fo much time loft. The plan thus adopted by the philofopher, it might be fuppofed, would have precluded all original obfervation and reflection; but he was diligent in natural purfuits, and it was his ardent curiofity and thirft of knowledge that occafioned his death. He had the command of the fleet ftationed at Mifenum, when, in the month of Auguft, A.D. 79, a great eruption of Vefuvius broke out. On its firft appearance he fteered directly to the fpot, as well for the humane purpofe of giving affiftance to the fugitives, as for viewing the progrefs of the eruption. The volcano raged with the utmoft fury, and fpread alarm through all the vicinity. While others were flying he ordered his pilot

pilot to ſteer directly acroſs to Stabiæ, where his friend Pomponianus had a villa. He there landed, and paſſed the night in the houſe. In the mean time ſhowers of aſhes almoſt blocked up his apartments, while the walls were ſhaken with an earthquake, and towards the morning it appeared neceſſary to quit the place. In his flight he was ſuffocated, being then in the 56th year of his age, high in reputation and dignity, and in great eſteem with the emperor Titus. His works are as follow; "On the Uſe of the Javelin on Horſeback;" "On the Life of Pomponius Secundus;" "Of the Wars in Germany," in twenty books; "On Oratory," three books; "On Grammar," eight books; "On the Hiſtory of his own Times," thirty-one books; "On Natural Hiſtory," thirty-ſeven books. Of all theſe works, that on natural hiſtory is the only one that has come down to our times, and it is regarded as one of the moſt valuable relics of claſſical antiquity. The editions of this work were very numerous at an early period, and many learned men have employed their talents in correcting the text. Hardouin was ſuppoſed to be one of the moſt ſucceſsful as well as induſtrious editors. His edition, in five volumes 4to., Par. 1685, was ſuperior to any at that time publiſhed. He has been ſucceeded by others, and in 1779, Brotier gave a new edition at Paris, in ſix vols. 12mo., which is much eſteemed.

Pliny, the younger, C. Plinius Cæcilius Secundus, born at Como, in the reign of Nero, A.D. 62, was the ſon of L. Cæcilius, by a ſiſter of the elder Pliny. He was ſent to Rome for education, and after perfecting himſelf in the Greek language, he was placed under the tuition of Quintilian and Nicetes. His diſpoſition and talents cauſed him to be adopted by his uncle Pliny, and deſtined to be the heir of his name and fortune. He was in the eighteenth year of his age when the eruption of mount Veſuvius took place, which proved fatal to his uncle. He had imbibed ſo much of his uncle's ardour for ſtudy, that he choſe to remain reading the hiſtory of Livy, rather than accompany his uncle to a nearer view of the intereſting but fatal phenomenon. He began to plead cauſes ſoon after his uncle's death, but his labours in this way were ſoon interrupted by a campaign into Syria, with the rank of military tribune. He did not, however, wholly abandon his literary purſuits in that ſituation, but availed himſelf of the preſence of the philoſophers Euphrates and Artemidorus, who had been baniſhed Rome, with the other profeſſors of philoſophy, by Veſpaſian. After his return his reputation for eloquence ſtood ſo high, that when he was likely to harangue the people, vaſt crowds attended, and he was ſure to be greeted with the loudeſt applauſes, in which even the judges ſometimes joined. In the reign of Domitian he was raiſed ſucceſſively to the offices of quæſtor, tribune of the people, and prætor. Under Nerva he was appointed to the office of prefect of the Saturnian treaſury. In the third conſulate of the emperor Trajan, Pliny was one of the honorary conſuls termed *ſuffecti*, and on this occaſion he returned public thanks to the emperor in an oration, which he afterwards enlarged to the panegyric of Trajan. After this the care of the channel, and the banks of the Tiber, was next conferred upon him, with the augurate; and then he was appointed proconſul; whence he wrote to Trajan that curious letter concerning the primitive Chriſtians, which is extant among his epiſtles. Pliny's letter is eſteemed as almoſt the only genuine monument of eccleſiaſtical antiquity, relating to the times immediately ſucceeding the apoſtles, it having been written within about forty years after the death of the apoſtle Paul. It has been preſerved by Chriſtians themſelves, as a clear and unſuſpicious evidence of the purity of their doctrine and practice, and is frequently appealed to by the early writers of the church againſt the unprovoked calumnies of their adverſaries. It is not known what became of Pliny after his return from Bithynia; antiquity is alſo ſilent as to the time of his death; but it is conjectured, that he died either a little before or ſoon after Trajan; that is, about the year 116.

It appears that he loſt his firſt wife in the beginning of Nerva's reign, and that ſoon after he married his beloved Calphurnia: he never had any children. He was one of the greateſt wits, and one of the worthieſt men among the ancients. He had fine parts, which he cultivated with great care. He wrote and publiſhed a great number of pieces; but nothing has eſcaped the wreck of time except the books of Letters, and the panegyric upon Trajan. This has ever been regarded as a maſter-piece of excellent compoſition. It is an elaborate ſpecimen of true eloquence, chiefly of value as containing enlarged views of the duties of a ſovereign. Some writers have ſaid, that no panegyriſt was ever poſſeſſed of a finer ſubject, and on which he might better indulge in all the flow of eloquence, without incurring the ſuſpicion of flattery and falſehood; but others obſerve, that as it was compoſed at the very beginning of Trajan's reign, it has but little weight as a teſtimony to the merits of that excellent emperor. It might perhaps have been the happy means of fixing his character, and it is no ſmall praiſe if it produced this ſort of effect, and that the youthful emperor was determined by a life of virtue to deſerve all the encomia paid to him. His epiſtles, in ten books, are much to be prized for the anecdotes with which they abound, of the characters and incidents of the times, and likewiſe for the purity and elevation of their moral ſentiments, which impreſs a favourable idea of the writer. They were no doubt intended for the public. Every epiſtle is a kind of hiſtorical ſketch, in which we have a view of him in ſome ſtriking attitude either of active or contemplative life. They ſtrongly mark that love of applauſe which was unqueſtionably his ruling paſſion, and afford ſome curious facts relative to the modes of feeding a writer's vanity in thoſe times. They exhibit the writer as a profeſſed rhetorician, entertaining and perhaps wearying his friends with long and laboured orations and recitations, commanding conſtant plaudits by virtue of his rank, his wealth, and his truly eſtimable qualities; but he was probably in ſome inſtances the dupe of adulation. The beſt editions of Pliny the younger are the Variorum by Veenhuſius; and that by Longolius. His epiſtles have been tranſlated into Engliſh by lord Orrery and Mr. Melmoth; the verſion of the latter is ſingularly elegant. Pliny contributed largely to the maintenance of a public profeſſor for the inſtruction of youth in the place of his nativity; aſſigned an annual revenue for the ſupport of children of both ſexes, whoſe parents had been reduced to poverty; and founded a public library.

PLISA, in *Geography*, a town of Lithuania, in the palatinate of Minſk; 21 miles E. of Minſk.

PLITE *of Lawn*, in our *Old Writers*, ſeems to be an ancient meaſure, as a yard or ell, at this time: it is mentioned in the ſtat. 3 Ed. IV. cap. 5.

PLIVA, in *Geography*, a river of Boſnia, which runs into the Verbas.

PLIUSA, a river of Ruſſia, which runs into the Baltic, between Nerva and Ivangorod.

PLIUSKINA a town of Ruſſia, in the government of Irkutſk; 20 miles N.E. of Verchnei-Udinſk.

PLIWISCHEN, a town of Pruſſia, in the province of Samland; 28 miles E. of Konigſberg.

PLOCAMA, in *Botany*, ſo named by Dr. Solander, from πλοκαμος, *a head of hair*, in alluſion to its long pendulous

dulous entangled branches.—Ait. Hort. Kew. ed. 1. v. 3. 508. ed. 2. v. 2. 63. Schreb. 797. Willd. Sp. Pl. v. 1. 1210. Mart. Mill. Dict. v. 3.—Clafs and order, *Pentandria Monogynia*. Nat. Ord. *Rubiaceæ*, Juff.

Gen. Ch. *Cal.* Perianth fuperior, of one leaf, minute, five-toothed, permanent. *Cor.* of one petal, bell-fhaped, in five deep oblong fegments. *Stam.* Filaments five, fhort, inferted into the tube; anthers linear, erect, fomewhat incumbent. *Pift.* Germen inferior, globofe; ftyle thread-fhaped, fwelling upwards, longer than the ftamens; ftigma obtufe, undivided. *Peric.* Berry nearly globofe, of three cells. *Seeds* folitary, linear-oblong.

Eff. Ch. Calyx fuperior, with five teeth. Corolla bell-fhaped, five-cleft. Berry of three cells. Seeds folitary.

1. P. *pendula*. Drooping Plocama. Ait. n. 1. Willd. n. 1.—Native of the Canary iflands, from which country it was fent to Kew by Mr. Maffon in 1779; and of the Cape of Good Hope, from whence we have a fpecimen communicated by Mr. Lambert. It is, or was, kept in the greenhoufe at Kew; but no time of flowering being mentioned, the plant is perhaps now loft, without having ever been figured, or fully defcribed. The *ftem* is fhrubby, erect, two or three feet high, roundifh, fmooth, with generally alternate *branches*, of which the uppermoft are extremely numerous, drooping or pendulous, flender, obfcurely quadrangular, roughifh, leafy. *Leaves* oppofite, on fhort ftalks, linear, acute, entire, very narrow, fmooth, fomewhat flefhy. *Stipulas* fmall, acute, between the footftalks, permanent, and at length forming a narrow ring, round each joint of the ftem or branch. *Flowers* terminal, axillary, or from the upper forks of the branches, fmall, on fhort, fimple, roughifh *ftalks*, either folitary, or two or three together. *Berry* not half the fize of a currant. The whole plant, except the old *ftem*, turns black in drying.

PLOCE, in *Rhetoric*, a figure by which a word is repeated, by way of emphafis; in fuch manner, as not only to exprefs the fubject, but fome particular character or property of it.

Cruelty! yes, cruelty beyond all example. His wife's a wife indeed! So Cicero fays, Young Cato wants experience, but yet he is Cato.

PLOCKEN-ALBEN, in *Geography*, a mountain of Carinthia; fix miles S.E. of Mauten.

PLOCZKO, or PLOZK, a town of the duchy of Warfaw, late of Poland, and capital of a palatinate of the fame name in Mafovia, fituated on an eminence near the Viftula: the fee of a bifhop, fuffragan to the archbifhop of Gnefna. It is alfo the refidence of a palatine, a caftellan, and a ftarofta: and contains feveral churches richly ornamented, one of which is the cathedral. The provoft or dean is fovereign of the nobility who refide here, and is accordingly ftyled prince of that territory. In the caftle is a gymnafium or feminary. The provincial court of judicature is held in this town: and a good trade is carried on by its inhabitants; 64 miles W.N.W. of Warfaw. N. lat. 52° 17′. E. long. 19° 35′.

PLOEMUR, a town of France, in the department of the Morbihan; two miles W. of L'Orient.

PLOEN, or PLON, a town of the duchy of Holftein, which has feveral times been deftroyed by fire; 23 miles N.N.W. of Lubeck. N. lat. 54° 10′. E. long. 10° 22′.

PLOERMEL, a town of France, and principal place of a diftrict, in the department of the Morbihan. The place contains 4512, and the canton 11,800 inhabitants, on a territory of 207½ kiliometres, in fix communes. N. lat. 47° 40′. W. long. 2° 59′.

PLOESTI, a town of Walachia; 200 miles E. of Belgrade.

PLOEUC, a town of France, in the department of the North Coafts, and chief place of a canton, in the diftrict of St. Brieuc; 10 miles S. of St. Brieuc. The place contains 5073, and the canton 12,800 inhabitants, on a territory of 170 kiliometres, in fix communes.

PLOGASTEL, a town of France, in the department of Finifterre, and chief place of a canton, in the diftrict of Quimper; feven miles W. of Quimper. The place contains 1047, and the canton 10,809 inhabitants, on a territory of 230 kiliometres, in 13 communes.

PLOK-PENIN, in *Commerce*, a term ufed in the public fales at Amfterdam for a little fum given by the laft bidder. The plok-penin is a kind of earneft, by which it is fignified, that the commodity is adjudged to him.

The plok-penin differs according to the quality of the commodity, and the price of the lot. Sometimes it is arbitrary, and depends on the pleafure of the buyer; and, fometimes, it is regulated by the ordinances of the burgomafters.

PLOMBIERES, in *Geography*, a town of France, in the department of the Vofges, and chief place of a canton, in the diftrict of Remiremont; fix miles S.W. of Remiremont. The place contains 1109, and the canton 9947 inhabitants, on a territory of 215 kiliometres, in fix communes.

PLOMNITZ, a town of Silefia, in the county of Glatz; two miles N.W. of Habelfchwerdt.

PLOMO, in *Metallurgy*, a name given by the Spaniards, who have the care of the filver mines, to the ore of that metal, when it is found adhering to the furface of ftones, and incrufting their cracks and cavities in the form of fmall and loofe grains of gunpowder. Though thefe grains be but few in number, and the reft of the ftone have no filver in it, yet they are always very happy in meeting with it, as it is a certain token that there is a very rich vein fomewhere in the neighbourhood. And if in digging forwards they ftill meet with thefe grains, or the plomo in greater quantity, it is a certain fign that they are getting more and more near the good vein.

PLONCOUR, in *Geography*, a town of France, in the department of the Finifterre; eight miles S.W. of Quimper.

PLONE, a river of Pomerania, which runs into the Dammifch fee, at Damme.

PLONEVEZ *de Faou*, a town of France, in the department of the Finifterre; eight miles W. of Carhaix.

PLONGEON, in *Ornithology*. See COLYMBUS.

PLONKETS, in our *Old Writers*, a kind of coarfe woollen cloth. 1 Ric. III. cap. 8.

PLONSK, in *Geography*, a town of the duchy of Warfaw; 22 miles N. of Ploczko.

PLOSAWO, a town of Poland, in the palatinate of Belcz; 28 miles W.S.W. of Belcz.

PLOSS, a town of Germany, in the principality of Culmbach; fix miles N.W. of Bayreuth.

PLOT, ROBERT, in *Biography*, a natural philofopher and antiquary, was born, in 1641, at Borden, near Sittingbourn, in Kent. He was educated at Magdalen Hall, Oxford, where he took his degree of L.L.D. in 1671. Soon after this he became diftinguifhed for his zeal in philofophical and natural fcience, and was made a fellow of the newly conftituted Royal Society, of which learned body he was elected one of the fecretaries in 1682. In the following year he was appointed the firft keeper of Afhmole's mufeum at Oxford, and at the fame time profeffor of chemiftry in the univerfity. Antiquities were the leading objects of his purfuit, and in 1687 he was made regifter to the earl marfhal's court, and in 1695 the Mowbray-herald extraordinary.

nary. He died in 1696. He is principally known in the literary world by his two county natural hiftories, which were the firft of the kind publifhed in England, and were exemplifications of a great plan which he had formed for a natural hiftory of the whole kingdom. The "Natural Hiftory of Oxfordfhire" was publifhed firft in 1677, and again in 1705, with additions and corrections by Mr. Burman. That of "Staffordfhire" was publifhed in 1679, and reprinted in 1686. It was decorated with views of the feats of the nobility and gentry. It is at prefent extremely fcarce. Both thefe county hiftories include not only all that properly belongs to the natural hiftory, but whatever relates to arts, manners, and antiquities, and all other memorabilia. As fecretary to the Royal Society, he conducted the publication of their Tranfactions from N° 143 to 166 inclufive, and he communicated to it fome papers of his own. Since his death two letters of Dr. Plot's have been publifhed relative to antiquities in Kent and Thetford. He left a number of manufcripts, among which were large collections for a natural hiftory of Kent. Biog. Brit.

Plot, or *Plott*, in *Gardening*. See Grass-*plat*, &c.

Plot, in *Dramatic Poetry*, the fable of a tragedy or comedy; or the action reprefented therein.

Plot is more particularly ufed for the knot or intrigue which makes the difficulty and embarrafs of a piece.

The unravelling puts an end to the plot.

Plot, in *Surveying*, the plan or draught of any parcel of ground, *e. gr.* a field, farm, or manor, furveyed with an inftrument, and laid down in the proper figure and dimenfions. See Plotting.

PLOTILE, in *Geography*, a town of Samogitia; 25 miles N.N.W. of Miedniki.

PLOTINOPOLIS, in *Ancient Geography*, a town of Thrace, upon the river Hebrus; 22 miles from Trajanopolis, according to the Itinerary of Antonine.

PLOTINUS, in *Biography*, a Platonic philofopher, was born at Lycopolis, a city of Egypt, in or about the year 204. In very early life he began to fhew a great fingularity both in tafte and manners. He began to ftudy philofophy at about the age of twenty, and for fome time he attended the lectures of different famous profeffors, who then abounded in Alexandria, but he was diffatisfied with all their fyftems, and attached himfelf to Ammonius, who attempted to reconcile the different opinions then fubfifting among the philofophers, and founded a diftinct eclectic fchool, in which he taught his difciples certain fublime doctrines, and myftical practices, which he communicated to them under a folemn injunction of fecrecy. With the inftructions of fuch a preceptor, Plotinus, whofe mind had a ftrong tincture of enthufiafm, was highly delighted, and he told his friend, that he had now met with a tutor in all refpects fuited to his wifhes. Under this mafter he profecuted his philofophical ftudies during eleven years, and became a deep proficient in the abftrufe fubtleties, and myftical flights of his fyftem. Upon the death of Ammonius, he determined to travel into Perfia and India, to learn wifdom of the Magi and Gymnofophifts. In this refolution he was encouraged by the example of Apollonius Tyanæus, whofe pretenfions to the magic arts were faid to be derived from thefe fources. For fome time Plotinus confidered himfelf to be under an obligation not to difclofe the doctrines which he had learned in the fchool of Ammonius, in confequence of the injunction of fecrecy to which he had fubmitted, but two of his fellow-pupils having publicly taught the myfteries of their mafter, he thought himfelf abfolved from his engagement, and became a lecturer in philofophy upon eclectic principles. During ten years he confined himfelf to oral difcourfe, but at length he found it neceffary, as well for the convenience of his pupils, as for himfelf, to commit the fubftance of what he delivered to writing. The novelty of his plan of inftruction drew after him a crowd of auditors, among whom were perfons of high rank of both fexes. To the inftructions of thofe who were willing to become his auditors he devoted himfelf with the greateft ardour and affiduity. He frequently prepared himfelf for his fublime contemplations by watching and fafting; hence his enthufiaftic paffions were fometimes raifed to fuch a pitch, that he believed he was under the immediate protection of a genius, or familiar fpirit, of the moft eminent order, who was not merely a dæmon, but a god. The fuperiority which he fancied belonged to his tutelar genius, inflated him with a degree of pride, that bordered upon impiety, or perhaps infanity. He, however, enjoyed fo high a reputation for wifdom and integrity, that many private quarrels were referred to his arbitration, and feveral perfons of both fexes, when upon their death beds, fent for him to take upon him the care of their eftates, and the guardianfhip of their children. Such offices he never refufed, and he difcharged them in a manner that gave the higheft fatisfaction to the parties concerned. His excellent character fecured to him the efteem of many perfons of high rank, and particularly of the emperor Gallienus, and his emprefs Salonina. The romantic turn of his mind was fufficiently fhewn, by the ufe which he made of his intereft at court. (See Platonopolis.) He died in the year 270, when he was in the 66th year of his age. When he found his end approaching, he faid to Euftochius, "the divine principle within me is now haftening to unite with that divine being which animates the univerfe;" expreffing by thefe words a leading principle of his philofophy, that the human foul is an emanation from the divine nature, and will return to the fource whence it proceeded. By his difciple and biographer, Porphyry, he is reprefented as having poffeffed the power of working miracles: this was probably faid with a view of depreciating the Chriftian religion, of which Porphyry was a great enemy. The treatifes of Plotinus, which are fifty-four in number, were diftributed by his biographer under fix claffes, called Euneads. Proclus wrote commentaries upon them. At the requeft of Cofmo de Medici, Marfilius Ficinus made a Latin verfion of them, which was firft publifhed at Florence, under the title of "Plotini Opera ex interpet. Marfilii Ficini, cum commentariis, necnon Vita Plotini à Porphyrio confcripta 1492." The Greek text was afterwards publifhed at Bafil, from a manufcript ftated by Lambecci to be in the Imperial library, accompanied with the verfion of Ficinus in 1580. Dr. Enfield, in his abridgment, &c. of Brucker's Phil., fpeaking of Plotinus, fays "that he made it the main fcope and end of his life to dazzle his own mind, and the minds of others, with the meteors of enthufiafm, rather than illuminate them with the clear and fteady rays of truth. How much is to be regretted that fuch a man fhould have become, in a great degree, the preceptor of the world, and fhould, by means of his difciples, have every where diffeminated a fpecies of falfe philofophy, which was compounded of fuperftition, enthufiafm, and impofture. The muddy waters fent forth from this polluted fpring, were fpread through the moft celebrated feats of learning, and were even permitted to mingle with the pure ftream of Chriftian doctrine. Not only at Rome, where Plotinus taught, but firft in Alexandria, and afterwards in many of the principalities of Afia Minor, and even at Athens, the ancient feat of wifdom, the fyftem of Am-

monius

monius and Plotinus was embraced and propagated by men, who, in learning and abilities, were greatly ſuperior to its founders." Enfield's Hiſt. Phil.

PLOTTING, among *Surveyors*, the art of deſcribing or laying down on paper, &c. the ſeveral angles and lines of a tract of ground ſurveyed by a theodolite, or the like inſtrument, and a chain.

In ſurveying with the plain-table, the plotting is needleſs; the ſeveral angles and diſtances being laid down on the ſpot as faſt as they are taken.

But in working with the theodolite, ſemicircle, or circumferentor, the angles are taken in degrees; and the diſtances in chains and links. So that there remains a ſubſequent operation, to reduce thoſe numbers into lines; and ſo to form a draught, plan, or map. The operation is called *plotting*.

Plotting, then, is performed by means of two inſtruments, the protractor and plotting-ſcale. By the firſt, the ſeveral angles obſerved in the field with a theodolite, or the like, and entered down in degrees in the field-book, are protracted on paper in their juſt quantity.

By the latter, the ſeveral diſtances meaſured with the chain, and entered down, in like manner, in the field-book, are laid down in their juſt proportion.

Under the articles PROTRACTOR and PLOTTING-*ſcale*, is found, ſeverally, the uſe of thoſe reſpective inſtruments in the laying down of angles and diſtances; we ſhall here give their uſe conjointly, in the plotting of a field, ſurveyed either with the circumferentor, or theodolite.

PLOTTING, *Method of, from the circumferentor.* Suppoſe an incloſure, *e. gr.* A B C D E F G H K (*Plate* VI. *Surveying, fig.* 10.) to have been ſurveyed: and the ſeveral angles, as taken by a circumferentor in going round the field, and the diſtances, as meaſured by a chain, to be found entered in the field-book, as in the following table.

	Deg.	Min.	Cha.	Link.
A	191	00	10	75
B	297	00	6	83
C	216	30	7	82
D	325	00	6	96
E	12	24	9	71
F	324	30	7	54
G	98	30	7	54
H	71	00	7	78
K	161	30	8	22

1. On a paper of the proper dimenſions, as L M N O (*Plate* VI. *Surveying, fig.* 11.) draw a number of parallel and equidiſtant lines, repreſenting meridians, expreſſed in dotted lines. Their uſe is, to direct the poſition of the protractor; the diameter of which muſt always be laid either upon one of them, or parallel thereto; the ſemicircular limb downwards for angles greater than 180°, and upwards for thoſe leſs than 180°.

The paper being thus prepared, aſſume a point on ſome meridian, as A, whereon lay the centre of the protractor, and the diameter along the line. Conſult the field-book for the firſt angle, *i. e.* for the degree cut by the needle at A, which the table gives you 191°.

Now ſince 191° is more than a ſemicircle or 180°, the ſemicircle of the protractor is to be laid downwards; where, keeping it to the point with the protracting pin, make a mark againſt 191°; through which mark, from A, draw an indefinite line A *b*.

The firſt angle thus protracted, again conſult the book for the length of the firſt line A B. This you find ten chains 75 links. From a convenient ſcale therefore, on the plotting-ſcale, take the extent of 10 chains 75 links between the compaſſes; and ſetting one point in A, mark where the other falls in the line A *b*, which ſuppoſe in B: draw, therefore, the full line A B for the firſt ſide of the incloſure.

Proceed then to the ſecond angle; and laying the centre of the protractor on the point B, with the diameter as before directed, make a mark, as *c*, againſt 297°, the degrees cut at B; and draw the indefinite line B *c*. On this line, from the plotting-ſcale, as before, ſet off the length of your ſecond line, *viz.* 6 chains 83 links; which extending from B to the point C, draw the line B C for the ſecond ſide.

Proceed now to the third angle or ſtation; lay then the centre of the protractor, as before, on the point C; make a mark, as *d*, againſt the number of degrees, cut at C, *viz.* 216° 30′: draw the indefinite line C *d*, and theron ſet off the third diſtance, *viz.* 7 chains 82 links; which terminating, *e. gr.* at D, draw the full line C D for the third ſide.

Proceed now to the fourth angle D: and, laying the centre of the protractor over the point D, againſt 325°, the degree cut by the needle, make a mark *e*; draw the occult line D *e*, and thereon ſet off the diſtance 6 chains 96 links; which terminating E, draw D E for the fourth line: and proceed to the fifth angle, *viz.* E.

Here the degrees, cut by the needle, being 12° 24′ (which is leſs than a ſemicircle), the centre of the protractor muſt be laid on the point E, and the diameter on the meridian, with the ſemicircular limb turned upwards. In this ſituation make a mark, as before, againſt the number of degrees, *viz.* 12° 24′, cut by the needle at E; draw the line E *f*, on which ſet off the fifth diſtance, *viz.* 9 chains 71 links; which extending from E to F, draw the line E F for the fifth ſide of the incloſure.

After the ſame manner proceed orderly to the angles F, G, H, and K; then placing the protractor, making marks againſt the reſpective degrees, drawing indefinite lines, and ſetting off the reſpective diſtances, as above, you will have the plot of the whole incloſure, A B C, &c. Such is the general method of plotting from this inſtrument; but it muſt be obſerved, that in this proceſs, the ſtationary lines, *i. e.* the lines in which the circumferentor is placed to take the angles, and in which the chain is run to meaſure the diſtances, are, properly, the lines here plotted. When, therefore, in ſurveying, the ſtationary lines are at any diſtance from the fence or boundaries of the field, &c. off-ſets are taken, *i. e.* the diſtance of the fence from the ſtationary line is meaſured at each ſtation; and even at intermediate places, if there prove any conſiderable bends in the fence.

In plotting, therefore, the ſtationary lines being laid down, as above, the off-ſets muſt be laid down from them; *i. e.* perpendiculars of the proper lengths muſt be let fall at the proper places from the ſtationary lines. The extremes of which perpendiculars, being connected by lines, give the plot deſired.

If, inſtead of going round the field, the angles and diſtances have been all taken from one ſtation, the proceſs of plotting is obvious, from the example above; all here required, being to protract, after the manner already deſcribed, the ſeveral angles and diſtances, taken from the ſame ſtationary point in the field; from the ſame point or centre on the paper. The extremities of the lines thus determined, being then connected by lines, will give the plot required.

If the field has been ſurveyed from two ſtations, the ſtationary

tionary lines are to be firſt plotted, as above; then the angles and diſtances taken from each to be laid down from each reſpectively.

Plotting, *Method of, where the angles are taken by the theodolite,* i. e. *by back-ſight and fore-ſight* (as it is called) is ſomewhat different. To prepare the angles for plotting, the quantity of each muſt firſt be found, by ſubtracting the degrees of the fore-ſight and back-ſight from each other: the remainder is then the angle to be protracted. The uſe of parallel lines is here excluded; and inſtead of laying the protractor conſtantly on, or parallel to meridians, its direction is varied at every angle. The practice is thus:

Suppoſe the former incloſure to have been ſurveyed with the theodolite, after the manner of back-ſight and fore-ſight; and ſuppoſe the quantity of each angle to be found by ſubtraction.

An indefinite line is drawn at random, as A K, (*fig.* 11.) and on this the meaſured diſtance, *e. gr.* 8 chains 22 links, is ſet off, as in the former example: if now the quantity of the angle A have been found 140°, the diameter of the protractor is to be laid on the line A K, with the centre over A; and againſt the number of degrees, *viz.* 140, a mark made, an indeterminate line drawn through it, and the diſtance of the line A B laid down from the ſcale upon it.

Thus we gain the point B; upon which laying the centre of the protractor, the diameter along the line A B, the angle B is protracted, by making a mark againſt its number of degrees, drawing an occult line, and ſetting off the diſtance B C, as before.

Then proceed to C, laying the diameter of the protractor on B C, the centre on C protracts the angle C, and draw the line C D: thus, proceeding orderly to all the angles and ſides, you will have the plot of the whole incloſure A B C, &c. as before.

Plotting-*Scale,* a mathematical inſtrument uſually of box-wood, ſometimes of braſs, ivory, or ſilver, and either a foot, or half a foot long, and about an inch and a half broad.

It is denominated from its uſe in plotting of grounds, &c.

On one ſide of the inſtrument (repreſented *Plate* VI. *Surveying, fig.* 12.) are ſeven ſeveral ſcales or lines, divided into equal parts. The firſt diviſion of the firſt ſcale is ſubdivided into ten equal parts, to which is prefixed the number 10, ſignifying that ten of thoſe ſubdiviſions make an inch; or that the diviſions of that ſcale are decimals of inches.

The firſt diviſion of the ſecond ſcale is likewiſe ſubdivided into 10, to which is prefixed the number 16, denoting that ſixteen of thoſe ſubdiviſions make an inch. The firſt diviſion of the third ſcale is ſubdivided in like manner into 10, to which is prefixed the number 20. To that of the fourth ſcale is prefixed the number 24; to that of the fifth, 30; that of the ſixth, 40; and that of the ſeventh, 48; denoting the number of ſubdiviſions equal to an inch, in each, reſpectively.

The two laſt ſcales are broken off before the end, to give room for two lines of chords, marked by the letters C C.

On the back-ſide of the inſtrument is a diagonal ſcale, the firſt of whoſe diviſions, which is an inch long, if the ſcale be a foot, and half an inch, if half a foot, is ſubdivided, diagonally, into 100 equal parts; and at the other end of the ſcale is another diagonal ſubdiviſion, of half the length of the former, into the ſame number of parts, *viz.* 100

Next the ſcales, is a line divided into hundredth parts of a foot, numbered 10, 20, 30, &c. and a line of inches ſubdivided into tenths, marked 1, 2, 3, &c.

Plotting-*Scale, Uſe of the.* 1. *Any diſtance being meaſured by the chain, to lay it down on the paper.*—Suppoſe the diſtance to be 6 chains 50 links. Draw an indefinite line; ſet one foot of the compaſſes at figure 6 on the ſcale, *e. gr.* the ſcale of 20 in an inch, and extend the other to five of the ſubdiviſions, for the 50 links: this diſtance being transferred to the line, will exhibit the 6 chains 50 links, required.

If it be deſired to have 6 chains 50 links, take up more or leſs ſpace, take them off from a greater or leſſer ſcale, *i. e.* from a ſcale that has more or fewer diviſions in an inch.

To find the chains and links contained in a right line, as that juſt drawn, according to any ſcale, e. gr. that of 20 in an inch. Take the length of the line in the compaſſes, and applying it to the given ſcale, you will find it extend from the number 6 of the great diviſions to five of the ſmall ones; hence the given line contains 6 chains 50 links.

Plotting-*Table,* in *Surveying,* is uſed for a plain table, as improved by Mr. Beighton, who has obviated a good many inconveniences attending the uſe of the common plain table. See Phil. Tranſ. N° 461. ſect. 1.

PLOTTNITZ, in *Geography,* a lake of Sileſia, in the principality of Oels; four miles E. of Militſch.—Alſo, a town of Sileſia, in the principality of Neiſſe; three miles W. of Patſchkau.

PLOTUS, *the Darter,* in *Ornithology,* a genus of birds of the order Anſeres. The generic character is, bill ſtraight, pointed, toothed; the noſtrils have a ſlit near the baſe; face and chin naked; legs ſhort; all the toes are connected. The birds of this genus, of which there are three ſpecies, have a ſmall head, and long ſlender neck; they are chiefly ſeen in ſouthern climates; they live chiefly on fiſh, which they take by darting forwards the head while the neck is contracted like the body of a ſerpent.

Species.

Anhinga; White-bellied Darter. The head is ſmooth, and the belly white. It inhabits Braſil, and is about 34 inches long. It builds on trees, and is hardly ever ſeen on the ground; when at reſt it ſits with the neck drawn in between the ſhoulders. The fleſh, though ſometimes eaten, is reckoned rancid and oily. The bill is cinereous, yellowiſh at the baſe; irids golden; head, neck, and breaſt reddiſh-grey; body above black, the ſcapular feathers with a white ſpot in the middle; it has 12 tail-feathers, which are broad and long; its legs are of a yellowiſh aſh colour.

Melanogaster; Black-bellied Darter. Head ſmooth; belly black. It is about three feet long, and found in Ceylon and Java. There are three varieties of this ſpecies. 1. Above brown, beneath black; ſtreaks on the ſcapulars and oval ſpots on the wing-coverts white. Between the breaſt and belly is a rufous band. It is a native of Cayenne. 2. Black; back and ſcapulars ſpotted with white; wing-coverts yellowiſh-white; tail rufous at the tip. 3. Black; head, neck, and wing-coverts ſtreaked with rufous and brown. It is found at Senegal.

Surinamensis; Surinam Darter. Head creſted; belly white. Found, as its name imports, in Surinam; is about 13 inches long, and is domeſticated. It feeds on fiſh and inſects, eſpecially flies, which it catches with great dexterity.

PLOTZKAU, in *Geography,* a town of Germany, in the duchy of Anhalt-Bernburg; five miles S.S.W. of Bernburg.

PLOUAGAT, a town of France, in the department of of the North Coasts, and chief place of a canton, in the district of Guingamp. The place contains 2034, and the canton 7239 inhabitants, on a territory of $172\frac{1}{2}$ kiliometres, in seven communes.

PLOUARET, a town of France, in the department of the North Coasts, and chief place of a canton, in the district of Lannion. The place contains 4276, and the canton 14,092 inhabitants, on a territory of 260 kiliometres, in eight communes.

PLOUAY, a town of France, in the department of the Morbihan, and chief place of a canton, in the district of L'Orient; seven miles N. of Hennebon. The place contains 3586, and the canton 12,304 inhabitants, on a territory of 215 kiliometres, in seven communes.

PLOUBALAY, a town of France, in the department of the North Coasts, and chief place of a canton, in the district of Dinan; nine miles N. of Dinan. The place contains 1385, and the canton 6008 inhabitants, on a territory of $92\frac{1}{2}$ kiliometres, in eight communes.

PLOUDALMAZEAU, a town of France, in the department of the Finisterre, and chief place of a canton, in the district of Brest; 10 miles N.N.W. of Brest. The place contains 2899, and the canton 14,588 inhabitants, on a territory of $177\frac{1}{2}$ kiliometres, in 12 communes.

PLOUDERY, a town of France, in the department of the Finisterre, and chief place of a canton, in the district of Brest; five miles E.N.E. of Landerneau.

PLOUESCAT, in *Geography*, a town of France, in the department of the Finisterre, and chief place of a canton, in the district of Morlaix. The place contains 2138, and the canton 9648 inhabitants, on a territory of 125 kiliometres, in five communes.

PLOUGH, in *Agriculture*, a well-known implement for breaking up the ground for tillage crops. It was invented at a very early period, being, perhaps, nearly coeval with the cultivation of the soil itself, as, without some kind of a plough, no produce of any consequence could possibly have been derived from the ground. It is an implement which was well known to the Egyptians, the Greeks, and the Romans, and which has prevailed in most of the Eastern countries for a vast number of ages.

These tools are constructed in different ways, according to the particular uses to which they are to be applied, and the nature of the land on which they are to be employed; as it is obvious that no one sort of plough can be made use of in all cases with equal success: differences in the nature of the soils, situations, and methods of performing the work, must necessarily require a diversity in their forms and modes of construction. Some of the more common and less complex kinds may, however, be very generally applied in the cultivation of land, and, of course, are the most useful on most sorts of arable farms. It is remarked in the Essex corrected report on agriculture, that "there is scarcely a circumstance in the agriculture of the kingdom more surprising, after so general attention has been paid to it, than the extreme uncertainty in which the true structure of the plough yet remains. That variations for different soils and circumstances must and ought to occur, is admitted; but one plough for one specific object might have been produced, its superiority to others ascertained, and the principles in its construction, on which such merit depended, fully developed, and laid down in accurate drawings; yet this has not been done; and the only approximation to it is, it is contended, in a paper by the late Mr. Arbuthnot, which the writer published near forty years ago in his 'Eastern Tour.' Farming mechanics, it is supposed, look to the Board of Agriculture for supplying this great deficiency, which can be supplied only by a series of experiments, demanding a considerable expence, and more attention."

Ploughs may, with propriety, be divided into the *swing* and *wheel* kinds, the former being such as are wholly destitute of any sort of machinery that can produce resistance in the way of friction about the end of the beam. Those are of course the lightest of draught, but require the experience of a good ploughman in using them. But these sorts of ploughs vary much in different parts of the kingdom. When well made they are, however, very effective, and capable of being generally employed in the ploughing of the lighter sorts of land. And they have other advantages, which are those of not being so readily put out of order, and of affording less fatigue to the teams employed in drawing them.

Those of the latter sort are such as have the complex apparatus of wheels applied to them in some way or other, though they differ exceedingly in the manner in which this is done. From the steady manner in which these ploughs mostly proceed in their work, they are evidently capable of being managed by much less experienced ploughmen. It is suggested in the Middlesex Report, that wheels seem to have been added to ploughs in consequence of the want of expertness in the workmen; and that in all sorts of land, but especially in that of the stony and more stiff kind, they afford

afford much aſſiſtance, by enabling them to execute the work with greater regularity in the depth, and more evenneſs in the ſurface. But from the nature of the machinery with which they are loaded, they are evidently more expenſive in their conſtruction, more liable to be put out of order, and from the friction that is thus produced require more ſtrength in the teams that are employed in drawing them. Beſides, they have the diſadvantage of being more apt to be put out of order in their courſe, by the occurrence of ſtones, clods, and other ſurface inequalities, than thoſe of the former kind. An inconvenience attending theſe ploughs is alſo noticed by lord Somerville in the Communications to the Board of Agriculture, which is, that with *wheel-ploughs* workmen are apt to ſet the points of their ſhares too low, ſo as by their inclined direction to occaſion a heavy preſſure on the wheel which muſt proceed horizontally. Of courſe he conceives the effect of this ſtruggle to be an increaſed weight of draught infinitely beyond what could be imagined, on which account he thinks that the wheel is to be conſidered as of no conſequence *in ſetting a plough for work;* but that paſſing lightly over the ſurface it will be of material uſe in breaking old lays, or lands where flints, rocks, or the roots of trees are preſent, and in correcting the depreſſion of the ſhare from any ſudden obſtruction, as alſo in bringing it quickly into work again, when thrown out towards the ſurface. It is however believed on the whole, by the writer of the report juſt mentioned, that in comparing two extenſive diſtricts, one of which is managed with wheel-ploughs, and the other with thoſe of the ſwing kind, taking every deſcription of ploughmen that are met with in them, the wheel-ploughs will be found to have the advantage in point of neatneſs of work.

But the great weight of the carriage parts for the wheels, and the time and trouble which they require in adjuſting and fixing them, are great objections to the uſe of this ſort of plough in moſt caſes, and particularly for the general purpoſes of huſbandry.

Therefore, in the forming of all ſorts of ploughs, the leſs they are encumbered with machinery of the wheel or other kinds, the more *uſeful they will probably be found.*

All around Kelvedon, in the county of Eſſex, it is ſtated in the agricultural ſurvey of that diſtrict, that they make uſe of both ſwing or foot, and wheel-ploughs, and that it is much diſputed which is preferable. In favour of the ſwing-plough, it is contended that it is better calculated for fallowing, as the ſoil can be broken up to a greater depth, and it does not riſe at the headlands, which is the caſe with the wheel-plough; the ends of the furrows being ſhallower, from the wheels, as ſoon as they get upon the headlands, throwing the ſhare up. The ſwing, or foot-plough, is eaſier of draught, the prime coſt is leſs, and it is kept in repair at a ſmaller expence.

The wheel-plough, on the other hand, keeps a more regular depth, and will turn a ſhallower furrow, when the fallows are put upon the ridge, or formed into ridges; the work can be done with more regularity, the wheels being put out to the exact width at which furrows are to be made; this is of material conſequence. And further, wheel-ploughs about the above place, can be worked when ſwing ones will choak on ſtubbles, and they are varied in *pitch* with more exactneſs, as well as go deeper than the others; but ſwing-ploughs are better, if the land be at all wet.

It may be noticed, however, that when the men are accuſtomed to ridge-ploughing, they will do it as well with the ſwing or foot-plough as with the wheel, but they cannot block up hard land in the ſummer ſo well with it.

And in reſpect to the depth of this ſort of work, ſome contend that very deep ploughing can hardly be effected without the aſſiſtance of wheels to the ploughs. Beſides, if the land is to be broken up for fallow late in the ſpring, and the ſoil comes up in large blocks, which is ſometimes the caſe in wet land and late fallowing, the ſwing, or foot-plough, is apt to be thrown out of the furrow, and does not perform its work ſo well as the wheel-plough.

It is found a matter of great importance in the conſtruction of the ſwing-plough, that the beam ſhould have the length of about ſix feet, or ſix feet and a half. The rule or reaſon for which, according to Mr. Arbuthnot, is that the line of traction from the tug at the horſe's ſhoulder to the centre of gravity and reſiſtance, is a little behind the point of the ſhare.

In the Rural Economy of Yorkſhire, after noticing the ſimilarity of the principles that are requiſite in the conſtruction of the ſhip and the plough, and conſidering the difficulty of fixing and reducing them to a regular theory, as nearly the ſame, it is obſerved, that the art of conſtruction in either caſe is principally attained by practice. In this diſtrict, ſays the writer, the ploughs of different makers paſs through the ſoil, with various degrees of facility and execution; nevertheleſs, though he has paid ſome attention to the different makes, he finds himſelf entirely incapable of laying down ſuch particular rules of conſtruction as would do his country any ſervice, or his work any credit. Even the general principles of conſtruction he muſt mention with diffidence.

The great difficulty in the conſtruction of a plough is that of adapting it to all ſoils, in all ſeaſons, and to all depths. If the ſoil break up in whole furrows, every inch of depth requires, in ſtrictneſs, a ſeparate plough, or a ſeparate regulation. Here reſts the main objection to the winding mould-board, which admits no regulation in reſpect of depth. If the ſemi-arch, or hollow of the hind part of the mould-board, be raiſed ſufficiently high to turn a thick furrow completely, it is of no uſe in turning a thin one. On the contrary, if it be brought down ſufficiently low to turn a ſhallow furrow properly, it is impoſſible to turn a deep one with it in a workman-like manner. There is not room for it within the hollow, or ſemi-archway of the mould-board. The inevitable effect of this is, either the furrow is forced away wholly by the upper edge of the mould-board, and ſet on edge; or the mould-board rides upon the furrow, raiſing the heel of the plough from the ground, the bad effects of which need not be explained. An upright ſtern, with a moveable heel-plate to turn the furrow at any given depth, is, in this point of view, much preferable to a hollow mould-board; and if its uſe in raiſing a creſt of mould, for the purpoſe of covering the ſeed, be added, its preference is ſtill more conſpicuous. But ſome of theſe inconveniencies have been obviated by the invention of moveable mould-plates, as will be ſeen afterwards.

Yet in the conſtruction of all ſorts of ploughs, there are, notwithſtanding, a few points or circumſtances that ought to be particularly, and in all caſes attended to; ſuch as the following: that part which perforates the ſoil, and breaks it up, and which is uſually termed the *throat* or *breaſt*, ſhould have that ſort of clean, tapering, ſharpened form, that is introduced with the greateſt readineſs, and which affords the ſmalleſt reſiſtance in its paſſage through the ground. According to ſome, this part ſhould be long and narrow, making an acute angle with the beam, as the length of the breaſt is ſuppoſed to have a tendency to preſerve the *flag* from being broken, on account of the ſurface for its ſupport being longer; which is a circumſtance of conſequence in the ploughing

ploughing of old lays for wheat, peafe, and other fimilar crops; as, by fuch means, the growth of weeds through the broken ground is prevented. And the refiftance of the earth againft the breaft is likewife leffened, in proportion to the acute angularity of that part againft the beam of the plough. The mould-board fhould alfo have that fort of curved, twifted, or hollowed-out form, which is beft calculated to leffen refiftance, and at the fame time give the furrow-flice the proper turn. And the beam and muzzle of thefe implements fhould likewife have fuch a conftruction, as that the team or moving power may be attached in the beft and moft fuitable *line of draught*, as this is a circumftance of great importance, when feveral animals are made ufe of together, that the draught of the whole may coincide in the moft perfect manner, and with the utmoft exactnefs.

Likewife, in the conftruction of every fort of plough, much regard fhould be paid to the weight, fo that they may have fufficient ftrength for the purpofe, without being unneceffarily heavy. Much may be done in this intention, by leffening the quantity of wood in thofe parts where there is no particular ftrefs, while it is retained fo as to have full power in the others. This has been much lefs attended to in the making of ploughs than its importance would feem to demand.

It is noticed in the Agricultural Survey of the County of Effex, that the *throat* at the fore end or neb of the plate or breaft in the Norfolk, and moft other ploughs, with the exception of the Rotherham, rifes from the upper furface of the fhare too perpendicularly, and too much at right angles to the line of friction, or preffure of the earth the plate has conftantly to act againft: working thus abruptly in the ground, the flice or furrow is violently torn, or burft from off the ground hand, broken and imperfectly turned over, inftead of being gradually cut, raifed whole, and whelmed over; as will always be the cafe, when the plough enters the ground obliquely, and at a proper angle; and that the plate or mould board is properly turned for raifing up, and turning the flice completely over.

It is a clear pofition, proved by experiment, that a femiellipfis is the true form of throat which is neceffary in ploughs, which is the part or fpace from the fhare point to the junction or approach of the breaft to the beam: and that there is found a remarkable variation in the form of the *breafts*, or mould-boards of the ploughs throughout the northern parts of the fame diftrict, and which is chiefly in the degree of concavity or convexity. Some wheel-wrights and farmers prefer a form rather concave, a flatnefs in the fore part, which joins the fhare, and which gradually fills up as the fweep recedes; others like it neither concave nor convex; and there are many ploughs in which the convexity is extremely great.

The great length of the breaft, in fome ploughs, is a circumftance which gives fteadinefs to the implements; but, at the fame time, it is probably the means of increafing the draught to the horfes in a great degree.

The fhortnefs of the breaft, if the curve or fweep be in perfection, or wears equally every where, may leffen friction, and certainly does, if the earth be loofe; but it probably may not have the fame effect in the firft earth, upon a ftiff layer. It is, however, a pretty general opinion, that it leffens it in all cafes.

A great variety of breafts, of different forms and conftructions, are reprefented in the plates upon ploughs, in the Agricultural Survey already referred to, which are well worth confulting by the inquirer on this fubject; and in the ploughs which are given here, there is alfo a very great diverfity in the fhape of the fame part, as will be feen by attending to the figures of the different plates.

Some cultivators in this diftrict ufe a breaft which is very convex, and contend that fuch a degree of roundnefs and fullnefs in the bofom is neceffary on heavy lands; alfo, that the foil fticks adhefively to the plough, if it be not thus rounded all the way; as well as that it turns the furrow better.

On the great variety of the breafts of ploughs, which appear in the plates of the above Survey, all of which are more or lefs diftinct and different from each other, it is obferved that they will all, on certain foils, and moments or times of tillage, make very good work; but it does not hence follow, that the form is a matter of indifference: fuch a conclufion would be very erroneous. There is a confiderable difference between a breaft paffing freely through the foil without loading, and driving the earth before it, or preffing it after the furrow is turned, and another that has either of thofe faults, not vifible perhaps in the work when finifhed, but to the great fatigue of the horfes. In the conftruction of the plough, as has been already feen, there is not a point of more importance.

One of the moft extraordinary circumftances in thefe breafts is, that of their all, with the exception of one, having more or lefs convexity, and in many, as has been feen, to a very extraordinary degree, efpecially in thofe about Birchholt and South-End. But in that furnifhed by his excellency Mr. Jefferfon, the late prefident of the United States of America, and which was fent to the Board of Agriculture, and firft tried by C. C. Weftern, efq., at Felix Hall in this diftrict, the formation was made on the idea, that as the bottom cut of the furrow is, or ought to be, perfectly *flat*, the breaft, which comes in direct contact with it, fhould be flat alfo; fo that there fhould be no difpofition in the mould to fink into any depreffion or concavity of the breaft; nor any projection from a right line in the breaft, to prefs or force into the furrow-flice, as it is turning. The idea is new and excellent: but what, on fuch principles, can be faid to the convexity in fome inftances, the fhape in the breafts of which muft conftantly have a tendency to *groove* that furrow-flice, from preffing in the centre. It fhould feem as if this muft, on every principle, be erroneous. The retaining of it, in the cafe of Mr. Ducket's plough, is fuppofed, more apparently than really, an exception, in confequence of the foil he had to work on, as it was invented for a very loofe fand only; and on fuch a foil the ftraight breaft is much more admiffible than on any other. This plough was feen at work on his farm many years ago, and it made excellent work: the convex *addition* to the flat furface, on the lower part, was probably made to divide the weight of the moving fand, and to keep enough of it in a due degree of elevation.

The objection to fo much concavity or flatnefs in the fore part of the breaft, as appears in that fupplied by the American prefident, is that of the loofe earth of the furrow *loading* there, which in fome cafes it is very apt to do.

Another point in which the ploughs here, as well as in other places, feem to be deficient, is in the height of the breaft from the ground: they are, for the moft part, too low behind; they fhould be, therefore, fomewhat raifed in this refpect. In turning over a furrow of loofe mould with rolling clods, the hind corner of the breaft fhould be high enough to fweep them over, but without preffure.

In the next place, that part which is called the ploughheel may be examined, which comprifes the pofition of the breaft behind, and forms, together with the end of the *reft*, that wedge which fills up the furrow. There are two principal

cipal queſtions, it is ſuppoſed in this diſtrict, in relation to the form of it:—What ought to be the breadth at bottom, or, more properly ſpeaking, the heel? and, what ſhould be the breadth at top? Some think the heel ſhould not be more than ſeven inches wide at bottom, which is the common width in ſome places. In examining the ploughs, in ſome caſes, it appears that the breaſt cloſes at the heel gradually, being a termination of that convexity of breaſt, of which ſo many farmers in this diſtrict are fond. Improvements have been made, in which this narrowneſs at the heel has been retained, without the convexity *before*, and but ſlightly behind. Some ploughs are found to be faulty at the top of the breaſt behind: it overhangs the furrow too much, and ſeems to the eye to be in a poſition to *preſs*.

In concluding the ſubject, it is remarked, that when the ploughs in a ſingle county can vary ſo much in the breaſt, or earth-board, and that in a diſtrict, too, not at all remarkable for diverſity of ſoil, which might call for conſiderable variations, it muſt afford a ſtrong proof how very undetermined the true mechaniſm of this moſt neceſſary of all tools ſtill continues to be. And this, it is contended, ought to excite the endeavours of every ſcientific farmer to multiply experiments, to reduce the conſtruction to plain and fixed principles.

In regard to the *pitch* of ploughs, it is noticed, that in the operation of working wheel-ploughs with improperly turned plates, or mould-boards, it will frequently happen, from the reſiſtance produced againſt the plough by ſtones, the tenacity or compreſſion of the earth, that they are obliged to be let down below the correſponding line of level, ſo materially neceſſary to the equal bearing between the pitch of the plough, and to the inclination which is thus given to the point of the ſhare downwards, and which ought always to be, as nearly as poſſible, in a line drawn parallel to that of the draught, and with the breaſt-work, which forms the fulcrum for the beam to reſt on. When a plough is ſo conſtructed, and ſet to work, that it bears unequally in theſe points, the end of the ſhare will be rooting or digging with its point downwards, kicking up and ſideways at the heel, and rendering it utterly impoſſible to plough the ground clean, or in anywiſe to lay the work uniform, or even in a tolerable manner; notwithſtanding an exceſſive and unneceſſary degree of labour is thereby produced to the ploughman and horſes. This deſcription is not ſo very clear, but there can be no doubt that not going cloſe at the heel is a very common fault in wheel-ploughs, and often ſeen in Norfolk, as well as in other counties, in caſes in the former, which have not the leaſt reference to the breaſt; and it is a juſt obſervation, that the horſes ſuffer much by it. The draught-chain in ſome ploughs, which draws by the hammer, between the coulter and the tuck, is not ſo parallel with the horizon as it would be, were it thrown more backward, which is the caſe in other tools of this kind, and forms a much better poſition.

In each of the above deſcriptions of ploughs there are ſeveral varieties in common uſe in different diſtricts of the kingdom; but it is only neceſſary here to deſcribe ſuch as have been found to anſwer in the moſt perfect manner in practice.

In the *ſwing* ſort, thoſe moſt in uſe are the *Rotherham* plough, which is a light uſeful plough for all the leſs heavy ſorts of ſoil, and which, probably from its neat ſimple conſtruction, is in more general uſe than any other, eſpecially in all the more northern diſtricts of the kingdom. It has certainly much ſuperiority where one plough is only required, and where the advantageous and economical method of performing the work with one man and two horſes without a driver is had recourſe to. It is in much eſtimation in all the Weſt Riding of Yorkſhire, and is ſaid in the Survey of that diſtrict to have been invented by Mr. Joſeph Foljambe, of Eaſtwood, about ſeventy years ago. As conſtructed in that part of the iſland, the dimenſions are as follow:

	Feet.	Inch.	
From the end of ſtilt on landſide to the point of the ſhare	7	4	whole length.
From the end of beam where inſerted into it to ditto, of ditto	3	0	
Length of beam	6	0	
Width of the head in the wideſt upper part	1	4	
Ditto of ditto at loweſt part	0	9	bottom working ſurface.
Ditto of ſhare behind the wing	0	$3\frac{1}{2}$	
Length of ſurface on which the plough touches the ground	2	$10\frac{1}{2}$	
Height from ground to top of beam where coulter goes through	1	8	
Width between ſtilts at the end	2	6	
Height of ditto from the ground	1	11	

Weight of wood and iron work, about $1\frac{3}{4}$ cwt.

And it has alſo a copſe rack, or hock with teeth, to admit of more land being given to the plough, or the contrary, which is particularly uſeful in many caſes.

It is noticed, that with a few trifling alterations it is made uſe of over the whole diſtrict, and from that being often called the *Dutch* plough, it is ſuppoſed to have been originally brought from Holland by the inventor.

But ſince its introduction it has received various improvements by different cultivators. In Mr. Bailey's attempts upon it, the mould-board, which is of caſt-iron, is ſo formed, that the ſod to be raiſed preſſes equally againſt it, in every part, from the ſock point to the place where it leaves it; and it varies from other mould-boards, in not beginning to take its riſe from the bottom of the heel, but at leaſt twelve inches farther forward towards the ſock, and in being cut away at the bottom oppoſite the heel, about three inches high, from the ſole, by which the turning of the ſod or furrow-ſlice is ſaid to be much facilitated. Thus improved, theſe ploughs have been found to anſwer perfectly in different trials, and have been allowed by thoſe who have ſeen them at work to go with more eaſe to the teams than thoſe of any other conſtruction.

And it has been ſuppoſed that the beam, from its crooked form, which is obvious in ſome of its improvements, by being fixed ſo low down in the part next to the handles, makes the plough require leſs force, and to go in a more ſliding manner. And that from the fore end of the beam being ſo much higher than the hinder part, the holder of the plough has more power, as the draught does not oppoſe ſo much reſiſtance to him; for if the beam were fixed to the handles much higher, as is uſually the caſe in other ploughs, this plough would be conſtantly rippling on the point, and in that way increaſe the weight of draught. And where it meets with any reſiſtance, ſuch as a ſtone, it is liable to riſe up, while in this form it proceeds in a ſliding manner, which affords a ſteadier motion, and renders it more eaſily held. Beſides, it is much ſtronger; as in the part where the left handle and the beam are joined, underneath the mortiſe where the tenor of the beam, by which the bearing of the ploughman on the handles does not in the leaſt affect that part, which in other ploughs is the weakeſt. In this improvement of the Rotherham plough, the mould-board is ſo conſtructed at the breaſt as to have a ſlight degree of convexity, inſtead of being concave, as is often the caſe, by by which the furrow-ſlice is ſuppoſed to be prevented from ſlipping down; and by the keeping the lower part from the ground, when it comes to the turn of the breaſt, it falls off; conſequently, as the furrow-ſlice has reſted on or by the ſide of the breaſt, when the plough has advanced twelve inches the work is finiſhed. By this improvement it is ſuppoſed that the plough will turn a furrow of any extent, from four to eighteen inches, where requiſite, and the ſame in depth; as the plough that will produce a wide furrow and turn it well, is capable of ploughing deep: the convexity of the breaſt alſo cauſes it to clean itſelf better, which is a deſirable property, as it is thereby rendered leſs heavy, and leſs reſiſtance afforded by one protion of earth being prevented from rubbing upon another, and at the ſame time the work performed in a more perfect manner. The coulter has likewiſe a poſition ſo as to cut in a ſlanting manner, which cauſes any reſiſtance to riſe up more expeditiouſly, and the land to be opened with more facility than where it has a more perpendicular direction.

It may be noticed, that where this improved plough is employed with more than two horſes abreaſt, the additional ones muſt be put before the pair, as it has not land enough to follow ſingle horſes.

Thus improved, it has the excellent property of being ſmall and light, while it is ſufficiently ſtrong to reſiſt any power that may be applied to it. It is capable of ploughing any ſort of land, and in larger proportion than any other except the Norfolk and Suffolk ploughs. The chief improvements which have been effected in the form of this plough, are ſtated to be in the breaſt, and in fixing the beam to the handles or ſtilts. There is alſo a cock, or a ſort of crank, fixed by a ſcrew and nut, ſo as to keep the ſhare in its proper ſituation when the plough is drawn backwards.

A repreſentation of an improved plough of this kind may be ſeen in *Plate* XXX. *Agriculture*, on *Swing-ploughs*, at *fig.* 1.

Wheels have ſometimes been added to theſe ploughs as a ſort of improvement for particular purpoſes; and with either one or two fixed near the points of the beams, without any carriage parts, they have been found to paſs through the ſoil in a very light, eaſy, and ſteady manner, and where there are two wheels, to require no holder in many caſes, except in ſetting in turning out of the work at the ends of the ridges. As ſwing-ploughs, they are probably, however, capable of the moſt general application.

The *Northumberland* or *Cumberland* plough is an improved plough of this nature, which is held in very high eſtimation in moſt of the northern diſtricts, and which performs its work in a very excellent manner, being light, and of little draught. It ought to be much more generally employed than is at preſent the caſe on moſt kinds of ſoil.

Small's Chain plough is another plough of the ſwing kind, that is a very uſeful implement, and capable of very extenſive application. It has its name from that of the inventor, who conſtructed it about forty years ago. It is neatly formed, and very light in its appearance, but at the ſame time, from the addition of the chain, poſſeſſing great ſtrength. It is, therefore, capable of being employed in ſtrong rough ſorts of ſoil, where other ſorts of ploughs are liable to be deſtroyed, as when the ſhare, or even the coulter, in this implement, meets with any ſudden impediment or obſtructing cauſe, the ſtreſs is immediately thrown upon the chain inſtead of the beam. The ſock is alſo formed with a fin or feather, by which the firm earth in the bottom of the furrow is cut and moved more readily, and in a more complete manner than could be done by the ſock in the common plough. In this plough the mould-board is moſtly made of caſt-iron, having a gentle curve, by which the furrow-ſlice is thrown off with the leaſt poſſible reſiſtance. It is ſuppoſed by Mr. Donaldſon to be on the whole one of the beſt conſtructed ſwing-ploughs for all ſorts of ſoils, in a proper ſtate of cultivation, in common uſe in the iſland. It is capable of ploughing, with one man and two horſes yoked abreaſt without any driver, more than an acre a day with the greateſt eaſe. An improved plough of this ſort is ſhewn at *fig.* 2, in the ſame plate on ſwing-ploughs.

The *Somerville* plough is alſo an improved plough of the ſame ſort, in which the throat has a more clean ſharpened form, and the mould-board is rendered moveable in the manner that will be noticed in ſpeaking of the *Double Furrow* plough. It is capable of being made uſe of with advantage in breaking up deep ſtiff ſoils, as from the moveable nature of the extreme part of the mould-board the furrow-ſlice can be laid more or leſs flat, according to the particular circumſtances of the caſe. It is conſequently capable of a pretty general uſe in moſt ſorts of ſoils.

This ſort of improved plough is repreſented at *fig.* 3, in the ſame plate on different kinds of ſwing-ploughs.

The *Suffolk Iron Swing-plough* is another plough of this claſs, which is found uſeful in different caſes. It was, according to the author of the Agricultural Report of Suffolk, improved by an ingenious blackſmith in that diſtrict of the name of Brand, and made wholly of iron. It has been found to anſwer well in practice, in ſuch lands as are of a ſtrong heavy tenacious quality, and where much obſtruction is afforded by the roots and fibres of different ſorts of plants and vegetable productions. Its uſeful properties have been fully experienced in breaking up ſtrong heavy rooty lands on his majeſty's farm in the Great Park at Windſor, according to the author of the Agricultural Survey of Berkſhire, as it performs its work not only with more facility, but in a better manner than moſt of thoſe ploughs that are made uſe of in ſuch deſcriptions of land. The cops by which it is drawn are ſaid to have been conſtructed by Mr. Brand, and are extremely well contrived for the purpoſe.

An improved plough of this deſcription is ſeen at *fig.* 4, in the plate on ſwing-ploughs.

Ducket's Skim-coulter plough is another very uſeful implement of this ſort, which is capable of being employed with great advantage where the ſurface is coarſe or graſſy, in order to bury it to ſuch a depth as may prevent any inconvenience from its riſing to injure the crops that may be ſown upon ſuch lands. The principle upon which this plough operates is extremely ſimple, and of courſe of a very uſeful nature, being merely taken from that of trenching ground in the practice of gardening, or that of depoſiting the ſurface ſpit of earth in the bottom of the preceding furrow, and placing the ſecond, or that taken from below, upon it, by which means it is evident that that which was firſt turned down remains in a ſtate of decay, without any riſk being incurred of the graſſy material riſing ſo as to produce inconvenience in the operations that may be going on upon the ſurface. It is capable of performing its work to a conſiderable depth, where the ſoils are ſufficiently deep for the purpoſe.

And it has been remarked by lord Somerville, in a little tract on ploughs and oxen, that the ſkim requires a perpendicular direction, and that the coulter-hole ſhould be removed further from the throat and ſhare, as in the common poſition it would choak when in work.

By this ſort of plough the ground may be opened to any depth in ſeparate horizontal portions of earth; and as the weeds or graſſy ſurface are turned down in the firſt operation, and covered by freſh earth or mould from beneath,

a larger

a larger proportion of nouriſhment is ſuppoſed to be provided for the crop, while at the ſame time it is rendered more clean, and the inconvenience of the roots of the graſſes or other plants wholly got rid of. It requires a ſtrong team in the heavier ſorts of ſoil, but this is in ſome degree counterbalanced by the circumſtance of one ſuch ploughing being moſtly ſufficient for the crop. It is conſequently evident, conſidering the number of ploughings generally given in the ordinary way of preparing lands for a crop of barley or turnips, and under the following ſyſtem for wheat, and the labour and expence in the latter caſe, in raking, picking, and burning weeds, that the advantages of this plough are probably greater than are generally ſuppoſed. It has alſo advantages in another point of view, which are, that the ſoil is increaſed in depth, and the parts of it ſo looſened and broken down, that the fibrous roots of the crops ſtrike and extend themſelves more readily in it, and of courſe are better fed and ſupported. The noble writer juſt mentioned thinks, that in thin and ſandy ſoils it is more particularly uſeful, becauſe it cuts off all which is on the ſurface, at the depth of an inch, or an inch and a half, in order to its being laid in a ſtate of decay for a future crop, by which an increaſed depth of ſoil is given to every ſubſequent courſe of crops, and which aften acts as a pan or ſupport, to keep up manures in circulation, as their running through ſuch ſoils too quickly is conſidered a great misfortune and diſadvantage in ſuch ſoils.

A figure of this valuable implement is given in the plate on ſwing-ploughs, at *fig.* 5.

Beſides, it is alſo capable of being made uſe of without the ſkim-coulter as a common plough. When well made, it coſts from three to five pounds.

And there is a ſort of plough of this nature which has a double ſhare, the one being fixed directly over the other. It is made uſe of in ſome of the ſouthern diſtricts with advantage, in putting in one crop immediately after another, as by it a narrow ſhallow furrow is removed from the ſurface, and another from below placed upon it, to ſuch depth as may be thought moſt proper, it being capable of acting to ten inches or more. In this manner many ſorts of crops, ſuch as rye and other green crops that have much height of ſtem, may be turned down without any inconvenience of any of the parts ſticking out through the ſeams of the furrow-ſlices, by which the farmer has a clean ſurface of mould for the reception of the grain.

Another plough of this ſort, which differs much in the nature of its conſtruction, having a ſtrengthened coulter, and an application of lord Somerville's mould-board made to it, is not unfrequently made uſe of in ſome of the ſouthern diſtricts of the kingdom.

This very uſeful form of ſkim-coulter plough is indeed much had recourſe to in the neighbourhood of Ingateſtone, in the county of Eſſex. And a further variety of this kind of plough is made uſe of in ſome parts of Oxfordſhire. Mr. Kimber, of Little Tew in that county, both makes and employs this ſort of tool, and finds it to be extremely uſeful for certain purpoſes. The ſkim in this implement is fixed to a fore coulter, by which means it is found to do the work much better, than when attached to the common coulter, in which way ſome have found that it could not work well at all. Upon hollow land, it is, however, not at all approved of, as ſlicing the ſurface of ſuch ground is ſuppoſed by Mr. Kimber to be much worſe than turning it over in the uſual manner, and letting the ſurface-vegetables be laid into the diagonal poſition, with an edging of them ſticking, perhaps, out of the ſeams. But it is ſuppoſed by Mr. A. Young, that in this notion Mr. Kimber is in an error; as he contends that the vegetable growth upon the ſurface is to be rotted in ſome way, for it is ploughed in in every mode of tillage, and the only queſtion is, how to rot it in ſuch a manner as ſooneſt to convert it into the food of plants, ſo as they may be able to avail themſelves of that food. This ſurely is the means of leſſening, in the greateſt degree poſſible, that additional hollowneſs which muſt be cauſed in a meaſure, plough it in how you will. The furrow of common ploughing four, five, or ſix inches, is ſo ſhallow, that the warmth of the ſun, the moiſture of rain, and the influence of the atmoſpheric air, act to the bottom of it, and will convert vegetable ſubſtances into gaſeous matter ſooner than if expoſed to the immediate action of the ſun and air, which in all dry weather preſerve them, and muſt occaſion a greater hollowneſs than in the other caſe, in which they are ſooner conſumed. And further, the great ſucceſs which has attended the ſyſtem counter to that of Mr. Kimber, could not have taken place if his theory was juſt. Good farmers, when they ſkim-plough, or common plough hollow land, will adapt the operation to the ſoil the crop is to be put in, and the ſeaſon of tillage; and by theſe means provide a remedy for the expected evil: but this is as clearly applicable to a ſkim as to no ſkim at all.

This ſkim-coulter plough does not anſwer in ſome management, or where the ſoil is of a flinty nature, but ſtill many farmers in this diſtrict approve of it highly; and ſome think it excellent, eſpecially for ploughing turnip land for barley, when the weather and treading have made it a little ſtiff, alſo, if the fallow for turnips has become a little weedy; but do not uſe it on layers for wheat, as they plough their lays for that crop deep. Particular farmers, however, find that it makes neat and perfect work on clover lays for wheat crops, not going more than three or four inches deep, and yet ſkimming off ſufficient to bury every thing, and leaving the ſeams without any vegetable growth to be ſeen. Shallow ploughing clover land for wheat, is thought eſſential on theſe ſtone-braſh ſoils.

There are ſtill ſome other modes of conſtructing theſe kinds of ploughs, as may be ſeen in the Eſſex corrected, and ſome other Reports of the Board of Agriculture.

There is alſo a very great difference in the conſtruction of the common ſwing-ploughs of this diſtrict. The *ſwing-plough* with an improved breaſt, which is employed by Mr. Weſtern, is of a very beneficial kind, and is held in much eſteem in ſeveral different places.

About South-End, in the ſame county, they have alſo a *ſwing-plough*, which is pretty generally in uſe, but which has an uncommon degree of convexity in the fore-part of the breaſt.

And a very good *ſwing-plough*, which has an extremely effective addition for the purpoſe of keeping the coulter fixed ſteadily in its place, has been long in uſe upon all the eſtates of the late lord Petre.

The *Miner* is an implement of the plough kind, that is very uſeful for the purpoſe of looſening the ſoil to a great depth without bringing it up to the ſurface, a mode of operation which is particularly uſeful for various ſorts of taprooted plants, as well as for extirpating the roots of ſuch weeds as ſtrike deep into the ground. For theſe purpoſes it may be employed in the bottom of the furrow after the common plough. It is conſtructed in a very ſtrong manner, having only a ſhare without any mould-board.

The *Beverſton* plough is another ſort of uſeful tool of this kind, which was invented by Mr. Tugwell, and has been employed in ſome diſtricts in the more heavy kinds of land. It has its principle of draught given it in a very effective manner by an ingenious contrivance of iron work, in which, according to lord Somerville, the point of draught is *perpendicularly* above the *point* of *action*, or the throat or breaſt where the ſhare fits on. A plough of this nature is ſhewn in *Plate* XXXI. *Agriculture*, on *Wheel-ploughs*, at *fig*. 1, in which its dimenſions are as follow :

The *Double Furrow* plough is a kind of implement of this ſort, which has, at leaſt in its improved form, been found highly uſeful and advantageous. Ploughs of this ſort have been conſtructed in various ways, as with a double beam, and with a ſingle beam only, which is the manner in which they are uſually made at preſent. But the moſt improved plough of this nature is that conſtructed by lord Somerville, and for which he has taken out a patent. It is advantageous in performing more labour in a given time with a certain ſtrength of team, than other ſorts of ploughs, as producing two furrows at a time. It has been found uſeful on the lighter ſorts of land where the ridges are ſtraight and wide, though ſome think it more confined in its work than thoſe of the ſingle kind. A principal advantage in which it excels other ſorts of ploughs, is in the ſaving of the labour of one perſon, and in doing nearly double the work with but little more ſtrength in the team, in the ſame time. It is remarked by his lordſhip, in ſpeaking of this ſort of plough, in the ſecond volume of Communications to the Board of Agriculture, that the clean and ſharpened conſtruction of the breaſt and throat will warrant their breaking deep ſtiff land with infinite ſucceſs; in this caſe the coulters ſhould be ſet nearly ſtraight with the throat and ſhares : in croſs ploughing, or ſtirring, they may be ſet three-quarters of an inch towards the land, by which greater diſpatch will be obtained in ſeed time. Should they carry too deep a furrow, the correction of their ſhares is obvious; ſhould they hug too much to the land, or go unſteady to the ploughman, it muſt abſolutely proceed from a want of ſetting them true, relatively to each other, and from an undue regulation of the cops; here a nice attention is required : their power alſo of cutting a furrow level at the bottom ſhould afterwards be proved on a level floor. The want of this practice in the maſter has condemned many a good plough, when the fault was in the ploughman only. It may ſuggeſt itſelf, that two-furrow ploughs are unfit for hilly ground, but the very reverſe is the caſe. The effect of ploughing acroſs the inclined plane, or hill, is that of carrying the ſoil in time to the bottom of the field, which muſt be carted bodily up again at a great expence : let ſuch land be worked from the top to the bottom ; let one furrow be carried with the hindmoſt or land ſhare up the hill, and two down, ſo will the power be apportionate to the weight with which it has to contend, and needleſs toil to the team will be ſaved. That power which was required to carry two furrows up would be ſuperfluous in carrying the ſame down the hill, and the effect will be as 3 to 4, that is, an acre and a half, inſtead of two acres *per* day.

A plough of this improved conſtruction may be ſeen in the plates on ſwing-ploughs, at *fig*. 6.

In regard to the improvement of theſe ploughs, his lordſhip obſerves, in his tract juſt noticed, that from the deſign, which repreſents a ſide view, it may be obſerved that, beſides the moveable plates, there are coulters, ſtays, &c. and how firmly the plough is put together, and how little waſte there is of timber and iron work. And after noticing its conſtruction in the breaſt ſo as to leſſen reſiſtance, it is added, that the double-edged coulter is formed alſo to produce this effect ; in ſtrength and ſubſtance it is equal to the common or narrow coulter, and being leſs broad, preſents ſo much leſs for reſiſtance : when in work, the ſtay gives a ſteadineſs to it, the coulter being ſubject to frequent derangement, to correct which muſt occaſion frequent ſtops, alteration of the wedges, and loſs of time. And it is afterwards ſtated, that an economical and ſpirited ſyſtem of farming labour already prevails in ſome diſtricts ; in none more eminently, with reſpect to ploughing, than in Eſſex, on both banks of the Tweed, in Suffolk, Yorkſhire, and Norfolk. Here it would be no object to invade the ſyſtem already eſtabliſhed, for innovation is not palatable to farmers ; nor ſhould the firſt deep ploughing in Kent give way to any novel ſyſtem ; there can be no better huſbandry : but, except for beans and tap-rooted plants, ſubſequent deep ploughings are injurious, both as to expence and effect. Dr. Hunter, in his Eſſay on the Roots of Wheat, points out the depth needful for the ſupply of ſeminal roots in wheat and wheat corn in general ; that which is turned down then, in the firſt deep ploughing, ſhould be rotting for the ſucceeding crop. Let not the bottom know what the ſurface is doing ! Here two-furrow ploughs, even admitting them incapable of carrying a deep furrow, which is far from true, muſt come into admirable effect, for a twofold advantage can be taken,—of the ſeaſon in ſowing, and the work being done at half the expence. But where men are chained down by long uſage, and perhaps, for the convenience of conſtant road work, to teams of heavy corn-eating cart-horſes, two-furrow ploughs become, he ſuppoſes, objects of extreme importance, becauſe their horſes will not feel the difference between their own ſingle furrow, working one acre, and the well conſtructed two-furrow plough, with two acres *per* day : here is no ſyſtem deranged, and double work done.

The counties of Leiceſter and Stafford have profited much by their uſe under theſe circumſtances, although their two-furrow ploughs, in other reſpects good, have never been ſo conſtructed in the throat and breaſt as to deſtroy the means of reſiſtance. Without doubt, obtuſity in theſe particulars muſt add incalculably to the weight, muſt break the furrow, and ſo ſpoil the work ; moreover, let it not be forgotten, that removing reſiſtance not only diminiſhes the labour of the cattle, but is alſo of equal advantage in increaſing the ſtrength of the implement ;—the reſiſtances with a well conſtructed, and with an ill conſtructed plough, in performing the ſame work, are as different as the reſiſtance of of a well constructed king's cutter, and of a floundering Dutch merchantman, sailing with equal velocity.

And the noble inventor adds, that in his own county these ploughs have met with a reception more favourable than could be expected in so short a period. On the 16th of October, 1798, two-furrow ploughs were not thought capable of breaking up ley-ground, although in constant use for fallowing, but from their construction requiring six oxen. On the 16th of October, 1799, a very large and respectable farming society gave a premium for two-furrow ploughs, working ley-ground only. On the day following, in the presence of many members of this society, one acre and a half of ley-ground was broken up by four oxen, with infinite ease to themselves, in three hours and fifty-five minutes, they having, as part of a constant course of work, ploughed seventeen perches short of an acre of ley-ground the same morning: this was done to *prove* the *effect* of *moveable plates* at the extremities of the *mould-board*, that the furrows might be laid more or less flat; for mould-boards, formed to lay furrows in ley, so as to give the moist soil to harrows, cannot be of that form best calculated to make good work in stirring earths, more especially the last, which ought to be thrown up in small seams, as it were, that the seed may be duly buried. It has hitherto been held necessary to rip off the plate for this purpose, and drive in wedges, by which the mould-plate must be injured. From the trouble attending this operation, it has for ever been omitted, and the land, of course, imperfectly worked. But this inconvenience may be remedied, and the mould-board be adjusted with great facility and expedition, by the following means: when the mould-board is formed, and its plate fitted as usual, let the parts marked *a*, *a*, be cut off, and again connected with the fixed part of the mould-board by means of flat hinges, or of thin flexible plates of tempered steel, or of hard hammered iron, so as to admit of those parts being set to have different inclinations with the fixed part of the mould-board: by means of two screws passing from the inside through the lower parts of the handle of the plough, opposite the backs of these moveable pieces *a*, *a*; those screws may be made to keep them at any desired degree of inclination, according to the nature of the work to be performed. It is stated farther, that ley-grounds cannot be laid too flat, or seed-earths too much on an edge; and by this improvement of the mould-board the plough may be instantly adjusted for either purpose: when these moveable parts are screwed outwards, it will cause a proportionate convexity in the base of the furrow, and so give more earth to cover the seed. That plough which can give most mould to the harrow is the best for a ley crop. That part of the mould-plate that is marked with the dotted line *c c* being found most liable to wear, should be made of a double thickness, that is, twice the thickness of a new crown-piece; it will then last nearly as long as the plough. The increased weight of draught, when these moveable plates were extended, did not appear, in a two-furrowed plough, to be by the cops more than twelve pounds, in ley-ground, at six inches depth. It is needless to state the success of these alterations; the friction in furrows required to be laid flat was less than could be supposed, probably not more in both furrows than from twelve to six pounds.

With regard to the moveable mould-plate, and its operation on the furrow. If the breast of a plough be obtuse, the whole struggle lies there,—there is the furrow turned, and the hindermost part of the mould-plate has little or nothing to do: the furrow may be well laid for one particular sort of work, but the breast of the common plate can only be of one form, therefore can only turn one description of furrow; and this must be done at an increased weight of draught: this is beyond all contradiction. In these moveable plates, the furrow is not turned until it reaches the remotest point of action, at a distance of two feet from the point where the furrow is cut off from the land. By the gentle and progressive turn of the mould-plate, the earth hangs balancing, as it were, in the air, and the slightest pressure of the moveable plate lays it over. The principle of this plate is, as has been seen, to deposit the furrow at any angle required, and to qualify it thereby for the different purposes of husbandry. There is another principle in ploughing equally well established; namely, that the base or bottom of the furrow must be cut level and true, or the surface of the work will be untrue, and the crop derive otherwise material injury. To effect this, the plough must go close at heel, and upright in its work, therefore the furrow must assume one form only. A third principle equally certain is, that in ploughing ley-ground, or for sowing on one earth, the furrow should be laid far more flat than is advisable in the last stirring or seed earth. As for barley, &c. hitherto, we have obtained one of these objects at the expence of the other. No two-furrow plough could, for an instant, make work, except in an upright direction; for if it did, the land or left share would be buried too deep, and the furrow, or right share, would be thrown out of work. But still further the writer will be bold to say, that no single-furrow plough, whether constructed in China, in France, or in England, has ever yet, or ever will be able to answer all these purposes, without the aid of a moveable plate; and therefore, however good for a limited purpose it may be, it cannot be called a perfect implement; it is incapable of doing all that is for ever required of it to do. It would be the height of folly and extravagance to construct two implements where one would do. He therefore sits contentedly in the conviction, that these plates must be resorted to. And in many cases, the moveable plate will probably supersede the use of the turn-wrist plough.

His lordship adds, that it cannot be deemed irrelevant to the subject, here to state the result of a challenge given to the owner of these ploughs, to plough 24 days work successively, on his majesty's farm, either at Kew or Windsor, on the 10th of March. The challenge was accepted, and it is a matter of regret that this challenger did not venture to appear, although repeatedly urged to do so: because a trial for such a length of time, and between two breeds of cattle so distinguished for their powers in labour, must, his lordship supposes, have thrown great light on a subject of such importance to the farming world. That something, however little, might be proved, his majesty was pleased to allot the only piece of land then unstirred, 17½ acres, statute measure, which was ploughed by a two-furrow plough, four Devonshire oxen, six years old, a man and a boy driver, in six days and a few hours: the oxen were in good order at the commencement of their work, and finished it in higher order, as well as in flesh, than when they began. This is a strong fact; but numbers in the vicinity of London know it, and are ready to prove the fact. These oxen, as is the custom in their county, never tasted corn.

Mr. Perrott of Evesham, speaks of these ploughs as doing their work well, and as being on the best construction he ever saw. And Mr. Westphaling of Radvale, near Ross, in Herefordshire, observes, that this plough certainly makes exceeding good work, and turns the furrows remarkably well. The time of its arrival was not the most favourable, as their soil, in general light and easy, is now, by the wet and sun, caked, and works with great difficulty; notwithstanding which, not one farmer but says it will be of great

use

ufe in many inftances. It is lucky for him that his ploughman likes it double, and is inclined to ufe it on all occafions. Mr. Dougall alfo obferves, that Mr. Shirely from Warwickfhire gives a good account of the double-plough ; and fees no difference between the draught of four horfes in the double, and his own fingle-furrow plough ; a circumftance which has been noticed by others in fome cafes.

With regard to the advantage of thefe ploughs, his lordfhip offers the teftimony of another perfon, perfonally a ftranger to him ; his partiality, therefore, is to the plough itfelf ; not to the inventor. He is not difpofed to draw abfolute conclufions from ploughing-matches, becaufe much may depend on accident ; befides that, exertions might be made for three hours, without much apparent diftrefs, which neverthelefs could not be maintained for three weeks, and fo the public become mifled. Yet, as this match was much talked of, and many queftions on the fubject put to him, he wrote to Mr. Tweed to know the particulars : his tale is plain and unvarnifhed.

Mr. Tweed's land is ftrong and ftiff in quality, and not a turnip has been fown there for more than twenty years paft : it is what we term bean and wheat land. The practice of that country has been to allot 100 acres of land in tilth to four horfes ; therefore let it be remembered, that the faving of expence obtained by the ufe of the two-furrow plough does not arife from a comparifon on lands, expenfively cultivated with four or five horfes, incurring a charge of twelve, fixteen, or twenty fhillings *per* acre ; but in the county of Effex, and in the vicinity of Chelmsford, where it has long been a fyftem to work thefe ftrong foils with two horfes and no driver : and where this art is allowed to be as well underftood, and practifed with as much fkill and economy as in any part of Europe, Flanders not excepted. Mr. Tweed's account of the bufinefs in a letter to his lordfhip, is this : " In anfwer to the letter I have juft had the honour to receive, I take the liberty of ftating the experiments I have made with your two-furrow plough upon ftrong land, as well as the refult of the only match I have yet been engaged in. I put my firft plough to work with three horfes and one man, againft two of my own, and four horfes, held by two remarkable good ploughmen, who are very much averfe to any new implements : after exerting themfelves to the utmoft every day for a month, upon clover lays, bean and pea etches, for wheat, they allowed, very much againft their inclinations, that it performed the work beft, which is entirely owing to the fuperior form of the breaft, and the great advantage derived from the moveable plates. This trial having perfectly convinced me that there is an abfolute faving of five fhillings a day every day they are ufed, I ordered a fecond, and foon after a third, and have ever fince had all my work done with them, nine horfes, and three men, which before employed fix ploughs, twelve horfes, and fix men, caufing a reduction of one-fourth the horfes, and one-third of the men, and is, in my opinion, one of the greateft improvements that ever was made in agriculture, for which I conceive the public and myfelf highly indebted to your lordfhip. Being at Mr. Lovibond's rent dinner (the gentleman I live under), I made a propofal to the company, who were all farmers, to plough, for a wager, two acres of any land with the two-furrow plough and three horfes, as well, and in the fame time, as one acre could be ploughed by a fingle one and two horfes. This was accepted by Mr. Gibling of Hatfield, and a field of his fixed upon that had been fown with rye directly after harveft, (ftubble) upon a wheat etch, and being fed by bullocks and fheep in wet weather, poached a great deal ; and when the ploughing took place, was extremely dry and bound. A great number of fpectators attended ; at ftarting, the odds were three and four to one againft the two-furrow plough, as it was fuppofed not able to break up and turn hard work ; after a fair conteft, five farmers were appointed umpires, who were unanimous in their decifion, that the two-furrow plough, having executed the work foundeft and beft, and in the leaft time, was entitled to the wager.

Sandon, 1802. I remain, &c.

" In a fecond trial, the fweepftakes were adjudged by the umpires to the double-furrowed plough of Mr. Thomas Little Tweed, of Sandon. A double-furrowed plough was allowed, by the articles, to have four horfes ; but Mr. Tweed's was worked with only three, and ploughed two roods, not only in the beft agricultural manner, but within confiderably fhorter time than the other common plough did their one rood." The noble writer adds, that in addition to this teftimony he has only to fay, that it has not been his ill-fortune to verify the old adage, which fays, " a prophet is no prophet at home ;" for thefe ploughs are fpreading, with unexampled rapidity, over the county in which they originated : and at a very large meeting of farmers, held there lately, no ploughs of any other defcription appeared, and the prize given by fubfcription was contended for by thefe ploughs only.

It has been argued, that a two-furrow plough, with the double mortifed beam, has an advantage over that of the curved fingle beam, inafmuch as, by a fcrew, the beams can be brought nearer, or fet more apart, for the purpofe of cutting a wider or narrower furrow. In common ploughing, no great benefit was contended to refult from this power, but in fowing under furrow, great things were to be expected. Now let us look round, and fee where the tillage hufbandry is reputed to be good, and fingle-furrow ploughs in ufe, confequently, the fize of the furrow is optional ; let us fee whether the wide or the narrow furrow is preferred. We can in a moment inftance the ufage of the country round Weftham, in Effex, and Peterfham in Moulfey, in Surrey. In both inftances the land is level and good, and the broadcaft hufbandry very high in reputation, as their crops, on an average of years, are ready to teftify. Here the feed is ploughed in at a ten or fometimes at an eleven inch furrow. We are not, however, to eftablifh a general fyftem on two or three inftances—twenty or thirty might, perhaps, be adduced ; but they are worth, at leaft, one affertion. It has been his determination to avoid, as much as poffible, any comparifon of other implements with his own ; but he may fay, that he learns from one, who is as good a judge of hufbandry as any among us, and has compared the double-beam two-furrow with that of the curved fingle beam in mortifing and iron-work, and confequent tendency to derangement, there is an abfolute difference of one horfe in four in favour of the patent plough.

And if land is inclined to be wet and ftiff, the lefs trod it is, the better. Here Mr. Tweed's mode is to work three horfes, one on the land, and two in the furrow, one before the other, inftead of three abreaft ; and it appeared by the regulation of the *cops*, that is, an iron fcrew, acting through the end of the beam to regulate the depth of work, how little he has added to the weight of draught. It is almoft needlefs to fay, that the true point of draught fhould be exactly in the centre notch of the cops ; any deviation to the right or left can only be for the purpofe of counteracting a falfe friction or preffure, which muft have added to the weight. The fize of a furrow, provided it be of juft proportions, is optional ; that which he has preferred is nine inches and a quarter, and for every purpofe of hufbandry he knows of none better. It will give as much

 mould,

mould, or 'crumb,' (as we term it, provincially) to the harrow, as any other furrow whatever: this is the beſt object in ploughing for a ley crop. If ley peas are to be ſown, every other furrow, at nine inches and a quarter each, there will be an interval of eighteen inches and a half between the rows; a diſtance as much approved of as any we know. At every third furrow for beans, the interval will be twenty-ſeven inches three quarters; at every fourth furrow, thirty-ſeven inches; and it muſt be allowed, that if any implement be attached to a plough for the delivery of pulſe, or white grain in drills, the upright poſition neceſſarily belonging to the two-furrow plough, when in work, will qualify it admirably for the purpoſe.

Upon the whole, theſe obſervations place the utility of double ploughs in a point of view, that ſeems to deſerve the notice of the practical farmer in a much greater degree than has hitherto been any where done.

Norfolk Plough.—This is a kind of plough, that is held in much eſteem in that, as well as ſome other light diſtricts, as performing the work in an eaſy and expeditious manner without any great ſtrength of draught. The carriage and wheels in all ploughs of this nature, however, form objections to them, and at the ſame time render them awkward, clumſy implements. An improved plough of this ſort is ſhewn in the plate on wheel-ploughs, at *fig.* 3.

The head and beam are ſhort; while the carriage part and wheels ſtand very high in this ſort of ploughs, of courſe the fore end of the beam is much elevated, by which, advantage is gained in driving the horſes or team, as it is uſually drawn by two horſes yoked abreaſt, the ploughman directing them by reins, by which there is a ſaving of one perſon in the buſineſs.

In the county of Eſſex, Mr. Rogers prefers the Norfolk plough, in two circumſtances, to the common wheel-plough of that diſtrict: the point of the ſhare is nearer to the points in the wheels, where they touch the earth, a ſhortneſs which, in his opinion, eaſes the draught; and the mould-iron or plate, as it is called in Norfolk, turns the furrow better.

The common Eſſex *wheel-plough* is ſaid, however, to be a very good tool of this ſort, and which is uſed extenſively all around the town of Kelvedon. It has the carriage part for the wheels ſomewhat in the form, and the beam raiſed up at the point much in a ſimilar manner to that in the Norfolk plough.

Kentiſh Turn-wriſt Plough.—This is another ſort of ſtrong plough, much uſed in the ſtrong heavy, flinty or rocky ſoils in that diſtrict. It is a very powerful implement in ſuch ſorts of land, but extremely clumſy, heavy, and awkward. The expence of it, when complete, is moſtly about five or ſix guineas. A repreſentation of it is given in the plates on wheel-ploughs, at *fig.* 4.

In the ſurvey of that county, it is deſcribed as conſiſting of a beam of oak ten feet long, five inches deep, and four broad, behind which is a foot five inches by three and a half, and three feet and a half long, on the top of which the handles are placed; the foot is tenoned to the end of the beam, and mortiſed at the bottom to the end of the chep. Through the beam, at two feet five inches diſtance from the foot, is a ſheath of oak ſeven inches wide, and one and a half thick, which is mortiſed into the chep in an oblique direction, ſo that the point of the ſhare is twenty-two inches diſtant from the beam. The chep to which the ſhare is fixed is five feet long, four inches wide, and five inches deep. The ſhare is of hammered iron, weighs about thirty-two pounds, is twenty inches long, and from four inches and a half to ſeven inches wide at the point. The upper end of the beam reſts on a carriage with two wheels, three feet two inches high. On the axle-tree is a gallows, on which is a ſliding bolſter to let up and down. Through the centre of the axle is a claſp iron, to which is fixed a ſtrong chain called a tow, that comes over the beam, ſo fixed, as by means of notches (or a pin called a check) to let the whole plough out a greater length from the axle, thereby letting it down to a greater depth.

A different kind of *turn-wriſt* or *revolving* plough has been lately invented by Mr. Lumbert, in which there are two ſhares, one of which at the end of each furrow, or every length of the field, turns round, and lays another flag by the ſide of the laſt, diſpoſing it all the ſame way, in a ſomewhat ſimilar manner to that which has been deſcribed above. Figures of this implement may be ſeen in the Corrected Report of Oxfordſhire.

And beſides theſe different ſorts of ploughs, there are various other kinds in uſe in different diſtricts, as the *Single* and *Two-wheel Plough*, both of which are good ploughs for particular purpoſes; but any of the light ſwing-ploughs, may be readily converted into wheel-ploughs ſimply by the addition of that apparatus.

Alſo the *Hampſhire Patent Iron Plough* is a very uſeful plough in ſome caſes. It is ſeen at *fig.* 2. in the plate on wheel-ploughs.

A plough has likewiſe lately been invented, in Berkſhire, by Mr. Berriman of Speen, which is denominated a *Preſſing Plough*, and which is held in much eſteem by many perſons, who have given it a ſufficient trial, eſpecially upon clover lays. It is conſtructed under a patent, and coſts about twelve guineas. It is ſtated by the inventor and patentee, that it "is intended to be drawn over the land recently ploughed, in order to preſs in the grips or channels made by the common ploughs, that no hollow places may remain for the ſeed to be buried too deep, and that every kind of graſs, ſtubble, or any thing elſe, may be preſſed into the ground. After the field has been preſſed, almoſt any kind of ſeed may be ſown by broad-caſt; and it will, by rolling into the channels of the preſſing wheels, be evenly and equally buried at a proper depth, after being harrowed, and conſequently be kept out of the way of birds, and will come up more regularly. It is evident, therefore, that there is no neceſſity for ſowing ſo much ſeed to an acre, as in the common broad-caſt huſbandry; thus combining the advantages of the drill and the broad-caſt ſyſtems. This machine is alſo of ſuch a conſtruction, that in the moſt uneven ground, every wheel acts as fully and amply as if it were drawn over a level ſurface. One of the preſſing wheels, with or without the line before it, may be put before a common hand drill, and drawn by one horſe, by which means any ground, however foul, may be drilled; or a drill may be added to the preſſing machine, which has been deſcribed, with three wheels, ſo as to throw the corn into the channels."

Tools of the plough kind have likewiſe been contrived with more than one coulter, in order to reduce the ſurface more effectually; but theſe have in modern practice given way to implements of the harrow kind, ſuch as cultivators, ſcarifiers, ſcufflers, &c.

Double Mould-boarded Plough.—This is a kind of plough often uſed with advantage in making the furrows in ſetting potatoes, cabbage, and other ſimilar crops, and earthing up ſuch as are planted in wide rows. Thoſe whoſe mould-boards move on hinges, and may be ſet wider or narrower at pleaſure, are the moſt convenient.

Single-Hoe Plough.—This is alſo often uſeful in ſtirring the mould in the intervals of different ſorts of crops, and laying it to the roots of the plants, and thereby preventing the growth of weeds. The mould-board in this plough is so constructed, that it can be raised or depressed at pleasure according to the nature of the crop, and the intention with which it is used.

The *Single-Horse Plough*, too, is extremely useful for several purposes in tillage husbandry. This sort of tool is very common on the farms in the county of Norfolk, but they are made upon a very different and much inferior construction to this, which is in use upon the estate of Mr. Western in Essex, and found to work extremely well, but without a wheel. The different parts have the following proportions in his ploughs of this kind.

	Feet.	Inches.
From 1 to 2	6	2
1 — 3	2	6
5 — 4	3	2
2 — 6	1	1
3 — 13	0	6
13 — 4	1	4
8 — 9	1	10
8 — 14	1	2
4 — 12	0	11
15 — 16	0	9
a — *b*	1	0
c — *d*	0	6

Ploughs have likewise been invented and constructed entirely without coulters: of this kind is the *Argyleshire* plough, contrived by the Rev. A. Campbell, on which it is observed, that as the common plough is very liable to be choaked by an accumulation of stubble, &c. in the narrow angle under the beam before the coulter, and, not unfrequently, is thrown out of the ground, by catching small stones or shells between the points of the coulter and sock, both these inconveniencies have therefore been attempted to be obviated by throwing aside the coulter altogether, and supplying its place by an upright feather attached to the *land* side of the sock, and which serves the purpose of slicing off the furrow in the same manner as a coulter; for, being laid off on the same angle, it is found, in practice, to succeed to admiration. Small ploughs of this sort employed in horse-hoeing turnips, beans, cabbages, &c. of which the weight of the wooden part is about forty pounds, and of the iron-work about thirty-six, and cost about two pounds ten shillings each, are made in a very accurate manner, by Messrs. Brown and Co., coach-makers, Abbeyhill, Edinburgh, who have made several, and can supply any number of them on demand. This plough is found to answer extremely well, more especially in taking the earth away from the sides of a drill crop; for which purpose it is conceived to have attained absolute perfection; as its broad upright feather, which operates as a coulter, completely shields the plants from all risk of earth falling on them from the left side of the plough, while, at the same time, the ploughman correctly ascertains, that the part of the plough below ground, approaches no nearer to the roots of the plants, than the upper part does to their leaves; so that he can bring the plough to slice off the earth close in upon their sides, where necessary.

In point of draught, it is precisely the same as the common plough. It obtained the premium from the Highland Society.

And the same gentleman has invented a very curious and useful muzzle or copse for ploughs, which, by a single twist of a screw, gives both *earth* and *land* or depth and breadth at the same time, or either, as may be requisite, even in the most minute degree. It weighs from ten to thirteen pound according to the size of the plough it may be used for, and costs from nine to thirteen shillings. It is strong and durable, and may be had at the above manufactory.

There are still a few other kinds of ploughs, which are contrived and constructed for the purpose of accomplishing different views and intentions in husbandry, such as those for paring or taking off the surface or sward of the land, in different circumstances; for the removing of the wetness with which it may be impregnated or saturated in its more superficial parts, and for the forming and improving of roads in different cases, &c., as may be seen under their several proper heads.

In the first of these intentions, the *common paring plough*, and the *improved paring plough*, which is in use in the county of Chester, are extremely good tools, especially the latter, which is very much employed in different parts. See Paring *and Burning*, and Paring-*Plough*.

In the second view, there are different sorts of ploughs made use of in different places, and according to the different circumstances and soils in which they may be employed. The *common draining plough* is had recourse to in some of the midland districts of the kingdom for the more general purposes with great success, for which it is said to be a good, and not very expensive tool. The *drain* or *gutter* plough, which has been recommended by the duke of Bridgewater, is also an useful plough of this kind. It has been found beneficial in forming at once gutter drains on grass lands, which are retentive of moisture, but it requires a great strength of draught in all cases. The *common mole plough*, and the *improved mole ploughs*, by Lumbert and others, are likewise very good implements in many cases especially those of the latter kinds. There are also some others, which answer different purposes of the draining kind in a very effectual manner. See Mole-*Plough*.

In the last intention, a very useful plough has been invented by a blacksmith of the name of Brand, which will be described under the head of roads. See Road.

Plough, among *Book-binders*, is a tool with which they cut the leaves of books smooth. See Book-binding.

Plough, or *Plow*, in *Navigation*, an ancient mathematical instrument made of box or pear-tree, and used to take the height of the sun, or stars, in order to find the latitude.

It admits of the degrees to be very large, and has been much esteemed by many artists; though now generally disused amongst us.

Plough-*Alms*, a duty anciently of a penny, paid to the church for every plough-land, or hide of land.

"De qualibet carucata juncta inter Pascha & Pentecosten unum denarium, qui dicitur plou-almes." Monast. Ang.

Plough-*Bote*, in our *Old Writers*, a right of tenants to take wood to repair ploughs, carts, and harrows, and for making rakes, forks, &c.

Plough, *Gallows of a*. See Gallows.

Plough, *Handles of a*, the name given by farmers to the two pieces of the plough fastened to the earth-board, and to the sheat, and serving the ploughman to rest his force upon in the guiding of the plough. When they are considerably long, the plough is always guided the better, and the land is better tilled; but the lazy ploughmen are apt to cut them off shorter, that by bearing their whole weight upon them, they may, in a manner, ride, instead of walking. If they should ride, in this manner, on the long handles, they would tilt up the end of the beam, and raise the plough out of the ground.

Plough-*Head*, a name given by the farmers to the foremost

moſt half of the plough, or that part containing the two wheels and their ſpindle, the box, the crow-ſtaves, the pillow, the wilds, the tow-chain, and bridle-chain, and the ſtake. See PLOUGH.

PLOUGH-*Land*, *carucata terræ*, in our *Ancient Cuſtoms*. See CARRUCATE.

PLOUGH-*Monday*, the next Monday after Twelfth-day. The ploughmen, in the north-country, on this day, draw a plough from door to door, and beg plough money for drink.

PLOUGH-*Tail*, a name given by the farmers to that part of a plough which contains the beam, the coulter, or coulters, the ſhare, the ſheat and under-ſheat, the earth-board and handles, as alſo the drock, the ground-wriſts, and the retches. See PLOUGH.

PLOUGH-*Jogger*, a term provincially applied to a ploughman of the more ordinary kind: a ſort of bungler in the work of ploughing.

PLOUGH-*Wright*, a term applied to a perſon whoſe buſineſs it is to make ploughs, and other implements of huſbandry. Workmen of this ſort are moſtly very common in all country ſituations.

PLOUGHING, the act of breaking up, and looſening the ſoil by means of a plough and proper teams. This or ſome other mode of looſening and turning up the upper parts of ſoils, is in all caſes neceſſary to render them more ſuitable for the reception of the ſeed and the growth of the crops, and they have been conſtantly in practice ſince the very infancy of the art. As it is only by ſome ſuch method that a proper bed for the roots of the young plants can be prepared, and a proper condition of the land for ſupplying them with nouriſhment be provided; in performing the operation it is a matter of great utility for the farmer to have particular attention not only to the ſtate and nature of the ground, but alſo the ſeaſon of the year, and kind of crop that is to be cultivated, as in this way the preparation of his lands may be rendered more perfect and ſuitable, and at the ſame time ſome of the natural defects under which they labour be removed. In almoſt every ſort of ſoil it has been obſerved, that ploughing them up before the latter end of the autumnal or beginning of the ſpring ſeaſon commences, renders them capable of imbibing and retaining a large portion of moiſture for the ſucceeding ſummer; while the turning them up during the ſpring and ſummer, cauſes much waſte and diſcharge of moiſture by evaporation and other means.

In caſes where the ſoil in its natural ſtate is too dry, and poſſeſſes too little tenacity for the growth and ſupport of ſuch crops as are neceſſary to be put into the earth in the ſpring months, the land, by being fully brought into a ſtate of preparation for the crop in the autumn, and the ſeed introduced without any additional ploughing in the ſpring ſeaſon, may be preſerved in a more moiſt and adheſive condition, conſequently in a more proper ſtate for the growth of ſuch crops; but where the ſoil is naturally moiſt, and the crops that are to be cultivated require that it ſhould be dry and mellow, when they are put into the ground, the ploughing, by being deferred for the winter, and performed as late as poſſible in the ſpring months, when it is become a good deal dried, will be the more advantageous for the crops that are to be grown upon it. But there are other circumſtances that conſtantly demand attention in the proceſs of ploughing land. In all the ſtiff, heavy, and more adheſive kinds of ſoils, that are much diſpoſed to the retention of moiſture, whether they be perfectly clayey or have more of a loamy quality, it ſhould be a common rule never to plough or turn them up when wet in any degree, except where the nature of the crop requires it: as when ſuch ſorts of lands are ploughed under ſuch a condition, the parts of which they are compoſed are very apt to cake and run together into hard lumps, that require much trouble and difficulty to be afterwards reduced into a fine ſtate. And further, great injury is produced by the treading of the team, as well as a much greater power neceſſary in performing the operation. They ſhould not, however, be ſuffered to become in ſuch a ſtate of dryneſs as to oppoſe too much reſiſtance before the work is undertaken. It, however, has been ſuggeſted, that in all ſuch lands where the clayey material is the moſt predominant, the ploughing may be performed when the ground is wet without injury, where the work is executed before the commencement of the froſts in the winter, while in the ſpring the team ſhould not be ſuffered upon the ground until it be in a properly dry condition. Communications to the Board, vol. iii.

But in all thoſe ſorts of land where there is a conſiderable depth of vegetable earthy matter, as thoſe of the moſs, moor, peat, and fen kinds, the ploughing of them, when under the ſtate of tillage, ſhould be executed when they are in a favourable condition in reſpect of dryneſs, as under the contrary circumſtances they can rarely be ploughed with benefit, and in many caſes not at all.

However, in moſt of the more light dry ſandy or gravelly ſorts of land, and perhaps in ſome of the more mellow deſcriptions of the loamy kinds, the work of ploughing may be had recourſe to, eſpecially in putting in the crops, when they are in a conſiderable degree impregnated with moiſture, without any diſadvantage being ſuſtained, and ſometimes even with benefit, as they are liable to part with their moiſture in too quick a manner. This circumſtance ſhould indeed direct the farmer in ſuch ſandy ſorts of land, to ſtir them as little as poſſible when the ſeaſon is hot and dry, ſo as merely to keep down the weeds, as much miſchief may otherwiſe be done by the exhalation of moiſture that may be cauſed. Theſe ſorts of lands are of courſe managed with much leſs trouble and expence of teams, as well as with leſs difficulty in reſpect to the ſtate of the weather, than moſt other ſorts.

The depth to which lands ſhould be ploughed, ſhould in ſome degree vary according to the nature of the ſoil, and the crops that are to be grown. It would likewiſe ſeem proper that the ſeed furrows ſhould have leſs depth than thoſe ploughings that may have preceded it; and perhaps, in general, deep ploughing is not ſo neceſſary as has been ſuppoſed, except in the caſes of tap-rooted plants. It has, indeed, been well remarked by Mr. Kent, in his Hints to Gentlemen and Farmers, that though deep ploughing has been much adviſed by different writers lately, on ſuch ſorts of land where the bottom and ſurface are of oppoſite qualities, and neither of them good; a mixture may in ſuch caſes be advantageous, and may be effected by their going below the uſual depth; but where the top and bottom, to the extent of eighteen or twenty inches, are ſimilar, he does not think it ever proper to exchange the ſurface part, which has been gradually for a great length of time increaſing in fertility, for the under part, which has only the property of being more freſh. He has ſtated that ploughing deep, except for certain ſorts of crops as above, is never requiſite or adviſeable. The growth of the common crops of corn or of graſs does not require any great depth. He likewiſe remarks, that where ground is ploughed to a great depth, the roots of weeds are only turned over, without being removed or thown upon the ſurface to decay, while clean light or ſhallow ploughing diſlodges them in a perfect and effectual manner. In ſome diſtricts, as that of Cornwall, where

where the ſoil is extremely ſhallow, a large produce is afforded; and in ſeveral other counties the land is found to be injured by deep ploughing, or going below the uſual depth, to which the lands have been ploughed. It is added, that hand-hoeing is known to every one to be more effectual in cleaning land than a ploughing; and the proceſs of paring and burning renders land perfectly clean, though it be only two inches in depth. All theſe tend to ſhew that ploughing to a great depth is by no means neceſſary in the cleaning of land; and it cannot but be generally admitted, that the longer the manure is kept within three or four inches of the ſurface the better, eſpecially on light ſoils, through which it is apt to ſink and eſcape too quickly.

It is, however, ſtated in the Calendar of Huſbandry, that in ſome of our well cultivated counties, the ſhallowneſs of the ploughing is remarkable; when almoſt every other point of management is very ſpirited and complete, a deficiency in this may not be at once perceived in the crops; but no doubt failures are often cauſed by it, though attributed to other circumſtances. Therefore the following hints are thrown out: 1. An additional depth ſhould firſt be gained in autumn, that a ſucceſſive change of ſeaſons may take effect in atmoſpheric influences before any ſeed is ventured in the raw ſtratum brought up. 2. The quality of that ſtratum ſhould be examined; it is ſometimes ſteril by reaſon of an acid, diſcoverable by boiling in water, and putting that water to the teſt of blue infuſions. 3. Animal and vegetable manures cannot be *buried:* at whatever depth they are depoſited, their conſtant tendency is to riſe to the atmoſphere. 4. Foſſile manures are extremely liable to be buried, having a conſtant tendency downwards. Chalk marle and clay are ſufficiently ſoluble, or ſo miſcible with water, as to ſink in a regular maſs; and are ſometimes found much below the path of the plough. 5. In ſoils of a poor *hungry* quality, there ſhould be ſome proportion obſerved between the depth of ploughing and the quantity of manure uſually ſpread; but this does not hold good on better ſoils. 6. Soils are rarely found that ought not to be ploughed, in common, ſix inches deep; many ought to be ſtirred eight inches, and ſome ten. 7. One deep ploughing (to the full depth) ſhould, it is conceived, be given once in twelve, eighteen, or twenty-four months; if this be ſecured, ſhallow tillage by ſcaling, ſcarifying, ſcuffling, ſkimming, or broad-ſharing, is in many caſes preferable to deep working oftener, and eſpecially for wheat, which loves a firm bottom.

But with regard to the depth of breaking up graſs-land, it ſhould be conſidered according to the manner of performing the buſineſs, as by the proceſs of paring and burning, and by that of merely ploughing. In regard to the firſt, it is nearly a general opinion in almoſt every part of the kingdom, that the firſt ploughing after the operation ſhould be ſhallow. It cannot, however, be admitted, that though the notion be far ſpread, it is therefore juſt, as the ſame thing prevails every where with reſpect to dung and the ſheep-fold; in which caſes there is great reaſon to think it erroneous. Manures that purify, and of courſe become volatile, cannot be buried, as have been ſeen above: plough as deep as you pleaſe, they all riſe ſooner or later into the atmoſphere; but with foſſile bodies, and probably with the aſhes of paring and burning, the caſe may in a great meaſure be different, and the good ſucceſs of the uſual management affords reaſon to juſtify the principle on which it proceeds. It may, therefore, be deemed a ſafe maxim not to plough after this operation for the firſt time, more than three, or at moſt four inches in depth. In the other mode of breaking up graſs-land after much experience, the writer has not found much difference either in the produce or effects on gravelly, clayey, or ſandy loams when executed in either way. In diſtricts where they uſually plough as deep as ſix or eight inches, he has obſerved (and it has been his own practice) that they plough up old graſs-land ſhallower, that is not above four inches deep, or at moſt five; the crop being every where put in upon this earth, except in the caſe of ſummer-fallowing peaty or moory lands. By not ploughing deep, the atmoſphere has a more direct influence in aſſiſting the putrefaction of the ſod covered, as it is with the crop which is probably one of the ſmothering kind.

But that two circumſtances are here to be attended to, which are the uſe of the ſkim-coulter plough, and that of ſowing on a ſtale furrow.

This plough he conſiders as one of the moſt effectual and applicable implements for breaking up this ſort of land. It is well known that when this is done by a common plough, there is a ſeam between every furrow-ſlice of graſs and weeds that grow through the ſummer to the injury of the crop; but which is wholly prevented by this plough, which is applicable in all caſes, except where there are roots or ſtones.

In regard to ſowing on a ſtale furrow, it is a good practice in breaking up old ley, when done in ſoils that are not tickliſh to get upon. On wet clays and loams, where not well drained, the buſineſs of ſowing is often obliged to be delayed too late in the ſpring, if ploughed in the winter, in which caſes it is ſafer to plough and dibble at once; but on other ſorts dry enough, ſuch as dry loams, ſands and chalk, it is better to plough in autumn and plant early in the ſpring: the froſts and ſucceſſive variations of weather, ſweeten the freſhly turned up ſoil, and crumble the ſurface enough to give a little mould, and not ſo much as to impede the perſon employed in dibbling.

But in all the heavy ſtrong ſorts of land a great improvement has been effected by ploughing the lands in the early autumn, ſo as to avoid as much as poſſible all ſpring tillage. In this way the ſummer fallows intended for barley and oat crops; the pea, bean, and tare ſtubbles which are to receive the ſame ſorts of crops, as well as the white corn ſtubbles which are deſigned for any ſort of ſpring crops, ſhould at this ſeaſon be ploughed in a careful manner in the proper form, ſo as to be the future ſeed earth, no further ploughings being admiſſible on any account. In this method, it is ſtated, in the Calendar of Huſbandry juſt noticed, that the crops are much larger and the expence conſiderably leſſened. The leading principle is this; if the land is ſo laid in autumn, on to ridges of that exact breadth which ſuits the tools, (whatever they may be, whether harrows, ſcarifiers, ſcufflers, or drills,) ſo that the horſes which draw them may walk only in the furrows, the froſts will have left ſo fine and friable a ſurface, that any of theſe operations may be performed long before the land in the common ſyſtem would be ploughed. The ſeed is uſually in the ground before the old faſhioned farmer thinks of moving. If he ploughs, he turns down a dry crumbling ſurface, and brings up the ſtiff wet *clung* bottom; if rain comes, then he is in the mire, and muſt wait for a ſeaſon; if a drying ſharp north-eaſt wind comes, his furrows are converted to oblong ſtripes of a ſtony hardneſs. In one caſe he is plagued with mud, in the other with impenetrable clods; he was poſſeſſed of juſt the ſurface he wanted, and which, once loſt, is not often regained. This ſurface may be ſcuffled, and immediately drilled ſecurely. In this practice the lands or ridges ſhould be laid out with great exactneſs and attention.

There are alſo other points that require attention in the ploughing of land; the furrow-ſlices ſhould be diſpoſed in a different manner, according to the nature of the grounds; the

the views of the farmer and the crops to be grown upon them, circumſtances which have been already noticed in ſpeaking of *ploughs*. The ſeed furrows, and thoſe where advantage is to be derived from the effects of the atmoſphere, ſhould be laid much leſs flat than in other caſes. The breadth of the furrow muſt likewiſe be regulated by ſimilar circumſtances. And there is another point that has been noticed by Mr. Kent, which is, that, on all the lighter ſorts of ſoils, it is eſſential to preſerve at the depth of from ſix to eight inches below the ſurface of the land, what in the language of farmers is denominated a *pan*, which is an unbroken bottom at ſuch depth; in conſequence of which, it is ſuppoſed, that manure may be kept longer in the top part; and that in ſuch ſeaſons as are very dry, the leſs deep this pan is, the leſs liable the grain will be to burn, eſpecially where it conſiſts of earth and not of rock, as the roots of the grain will find more moiſture by ſtriking againſt a body of compact earth, than in a greater depth of hollow earth, as the former obviouſly preſerves more moiſture in ſuch dry ſeaſons. There is alſo another advantage in this pan, which is, the having a leſs proportion of mould to work and keep in a ſtate of fertility. In ſuch caſes, where deep ploughing is had recourſe to, this compact bottom or pan muſt be broken and deſtroyed, for which a great deal more manure will become requiſite to keep the land in proper condition for the ſupporting of crops. On theſe accounts, care ſhould be taken in ſuch caſes, not to go ſo deep with the plough as to injure this firm earthy cruſt, and increaſe the difficulty of cultivating ſuch ſoils. See PAN.

In regard to the frequency of ploughing lands, it muſt, in a great meaſure, be directed by the ſtate or condition in which they are, and the nature of the crops which are to be grown upon them. It has been obſerved, in a late Syſtem of Practical Huſbandry, that the ſtiff, clayey, loamy, and even chalky ſoils will, in general, ſtand in need of more frequent ſtirring, either by means of the plough, harrow, or ſome other implement, in order to ſeparate and break down their tenacious particles, than thoſe of the ſandy or gravelly, and more light kinds, in which there is much leſs adheſion. Beſides, where lands have been in a courſe of tillage for ſome length of time, whether they are of a clayey, loamy, or even ſandy quality, they may require leſs frequent ſtirring than where the contrary is the caſe. And where the method of putting the ſeed into the ground by means of drill machines is to be had recourſe to, a fine ſtate of tilth will, in general, be indiſpenſably neceſſary. But, the nature of the crop that is to be cultivated muſt, in moſt caſes, direct the number of ploughings that may be neceſſary, as ſome demand a much finer ſtate of tillage than others; though in moſt caſes a well reduced earth is favourable. It has, indeed, been aſſerted by Mr. Tull, in his Horſe-hoeing Huſbandry, that the finer land of any kind is made by tillage, the richer, and more capable of ſupporting plants it becomes. A proof of which may often be met with in lands where a part has, from accident or other cauſes, been better tilled than the reſt, as, though they be afterwards conſtantly managed in preciſely the ſame manner, the part ſo treated always affords better crops than thoſe which have not had the advantage of ſuch tillage.

And where the nature of the crop is ſuch as to be greatly retarded and injured in its growth, by the occurrence of other plants, as in wheat and barley, the land will conſtantly require to be rendered fine and mellow, either by frequent ſtirring by the plough, or the growing of ſuch preparatory crops as have a tendency to bring it into a friable and clean ſtate, by the ſhade which they produce, and the repeated tillage and culture which they receive while growing. Alſo, where ſuch plants as produce large, knobby, or tap roots, in or upon the ſoil, are to be grown, it will be neceſſary to have the land well broken down, and rendered mellow by repeated turning over, in order that they may more readily puſh down, or extend themſelves in other directions. It has likewiſe been found, that a fine ſtate of tilth is always the moſt favourable for affording the nouriſhment and ſupport of crops in a free and equal manner, both on account of its admitting the fibrous roots of the plants to ſpread and extend themſelves with more facility, and the manures to become more minutely divided, and more intimately blended with the ſoils; as well as from the ſubſtances that conſtitute the food of the plants being more readily and more copiouſly formed by the chemical combinations and decompoſitions that take place under ſuch circumſtances. And further, by means of ſuch degrees of pulveriſation and mellowneſs, the ſeed, eſpecially when it is of the ſmaller kind, is not only more equally and more perfectly covered, but its vegetation more quick, from its becoming more fully in contact with the mould, and from the moiſture being more minutely diffuſed and retained in the ground, which is an advantage of much importance in the cultivation of many ſorts of crops.

The work of ploughing may, in moſt caſes, be well performed with any of the light well formed ploughs that have been deſcribed, with two horſes without a driver, being managed by reins by the ploughman; and where double ploughs are employed, three horſes may moſtly be ſufficient for effecting the purpoſe, being directed in the ſame manner; though in the uſual method of performing the work, with the common awkward ill-formed ploughs, in practice in many places, three, four, or more horſes are in general made uſe of, and the buſineſs executed with more difficulty and leſs diſpatch. The advantage of having recourſe to the improved ſorts of ploughs in this expenſive ſort of work, muſt, of courſe, be extremely obvious. It has been ſtated, in the third volume of Communications to the Board of Agriculture, that it has been lately found in Lancaſhire, that in a light loamy ſort of ſoil, Small's plough with two horſes abreaſt, and the ploughman driving them by means of reins, is capable of executing its work with equal expedition, and to a better depth when neceſſary, than the common ploughs of the diſtrict with four horſes, a ploughman, and a boy as driver. This great advantage is conſidered as depending upon the excellence of its conſtruction, and the team poſſeſſing the greateſt purchaſe in the draught, by being placed ſo near the plough; the leaſt variation in the formation or proportional diſtances of the different parts being, however, capable of deſtroying the effect. The Northumberland or Cumberland, and the Rotherham ploughs are alſo found equally valuable.

Having taken this view of the nature of performing this important operation in the cultivation of land, it may be uſeful to ſtate the facts as they have been collected in the beſt arable diſtricts of the kingdom, by the ſurveyors employed by the Board of Agriculture. In Weſt Norfolk, as ſtated by the ſecretary to the Board, there is much difference in performing the work. On ſome farms he has remarked, the furrow to be cut flat and clean; but, on others, *wriſt-baulked*, by tilting the plough to the left, which, raiſing the ſhare-fin makes that inequality, and is partly the occaſion of his having found ſo many ploughs at work, which would not go a ſingle minute without holding. In Eaſt Norfolk, Mr. Marſhall has obſerved, that the ploughman, to prevent the ſoil when moiſt from turning in whole gloſſy furrows, which they term "ſcoring," ties a piece of ſtrong rope yarn round the plate or mould-board, which by theſe means

means is prevented from acting as a trowel upon the soil. And Mr. Young found this the practice at present; but was informed, that it was not so generally wanted as formerly, which they attributed to better constructed *plates* or mould-boards.

And in relation to the depths of ploughing, he states, that Mr. Thurtell, at Gorlstone near Yarmouth, has a great opinion of deep ploughing. Three or four inches are a common depth about him, but when land is clean he always ploughs five, and sometimes six or seven; he is careful, however, not to do this on foul land; he has no apprehension of breaking the pan, having many times gone deep enough for that without any inconvenience, and as to bringing up a dead soil he has not seen any ill effects from it. The land on which this practice has been pursued, is a good sandy loam on a clay marle or gravel bottom. But Mr. Everitt, of Caistor, is of a different opinion; he is not fond of deep ploughing; he thinks four inches deep enough: his ideas on this subject, however, seem, Mr. Young says, to have been chiefly the result of a trial made by his father, who broke the *pan* by trench-ploughing a piece of land, which has ever since been full of charlock, &c. The difference of their soils will not, he thinks, account for this opposition of sentiment. Gorlstone is a very good sandy loam at 20*s.* or 25*s.* an acre, though certainly inferior in depth and goodness to the land at Caistor. In discourse with these two gentlemen on this subject, Mr. Everitt remarked to Mr. Thurtell, that if he ploughed deeper than common, he ought to add manure proportionably to the quantity of soil stirred; an old idea of his, and he remembers well, combated by his friend Arbuthnot. It is added, that Mr. Francis, of Martham, ploughs four or five inches deep: and Mr. Cubit, of Honing, on a fine sandy loam, always as shallow as possible; and at East Ruston, where the soil is exceedingly good, the same; he thinks a smaller quantity of muck by this means answers. But they do not plough four inches deep at Scotto; Mr. Dyble remarked, it is observed, that a piece was there ploughed five or six inches deep, and damaged for seven years; three inches enough; the soil much of it a fine sandy loam, manifesting no want of depth. Mr. Palgrave, at Collishal, however, applies deep ploughing in one case with singular judgment; he brings by water from Yarmouth large quantities of sea ooze, or haven mud; this, on dry scalding gravels and sands, he trench-ploughs in without fear of burying, and finds, on experience, the effect very great, forming thus a cool bottom, so that the surface burns no more. And Mr. Johnson, of Thurning, thinks that it is common to plough too shallow; nor does he believe that any mischief results from depth. He has made a ditch one year, and thrown it down again the next, and the benefit was seen for seven years, without the soil being acted on by draining, or wanting it; nor is he nice to have his muck ploughed in shallow, having no fear of burying it. By ploughing a good pitch for turnips, they come slow to the hoe, but when they do get hold, thrive much faster than others. He also finds Mr. Reeve, of Wight, an advocate for deep ploughing; he goes five inches deep; if he did not he should *get* no turnips. And Mr. Dursgate approves of deep ploughing; remarking, that he breaks up his *ollonds* deeper than most people. Mr. Willis observing the marle on his land was sunk below the common path of the plough, turned it up again by going a deeper pitch, and found it to answer nearly as well as a new marling; and he suffered no inconvenience. It is added, that the two-furrow work about Holt, &c. is to turn a furrow on lay or *ollond;* the plough then returns and throws it back with the untouched land that is under it, into the former open furrow, and overlapping that, rests on the baulk left beside it. It is also observed, that Mr. Money Hill, in breaking up the strongest land he has, ploughs deeper than on the lighter; that is, four inches, and on light three and a half; and on that depth drills on flag; if twitch in the land, ploughs only three and a half; if beyond the usual depth, would hurt the crop and give weeds. Waterden is a thin and flinty soil. It is remarked, that Mr. Hill's father lived for many years at Gateson, and was succeeded in the farm by Mr. Parker. Mr. Hill's last crop yielded 400 lasts of corn, above 320 of which were barley. He generally ploughed four inches deep, and never more than four and a half. Mr. Parker in the first year ploughed the second barley earth seven inches deep, sowing about eight score acres (the common quantity twelve score.) He fold that year but twenty lasts; the seeds also were worse than usual; the wheat that followed, good; but in general, he had indifferent crops for fourteen or fifteen years. And in March he applies what he calls *one-furrow* work to a foul stubble, if he has such by chance; the land side horse (that on the left hand) always, after the first furrow, returns in it; it is left open; harrowed down with a heavy harrow; then the weeds gathered and burnt, and the next ploughing given across. Norfolk Corrected Agricultural Report.

The Agricultural Report of Hertfordshire states, that the common depth of ploughing about Westmill is four or five inches; but Mr. Greg ploughs as deep as the staple will admit; which account of his bailiff implies, that five inches are not the depth of the staple. The crops in that vicinity are so great, that the writer should suppose that there cannot be any material error in the basis of their practice. And Mr. Whittington remarks, that winter tillage is but of little use: he avoids it as much as possible, and has found that the application of a break, or a large four-horse harrow, is a good substitute for some ploughing.

With regard to the strength of team which is necessary, it is stated by the author of the Norfolk Report, that Mr. Thurtell, through the summer, ploughs with three horses two acres a day, one always resting: this from finishing sowing spring corn to the end of the turnip tillage. There is no doubt of their ploughing with ease an acre in four hours and a half. And in the clays of Marshland, all are foot or swing-ploughs; never more than two horses used: they do an acre a day, and in summer one and a half at two journies. And at Remsby, each pair of horses two acres a day at two journies.

About thirty years ago, the common price of ploughing was 2*s.* 6*d.* an acre, in every part of the district, except Marshland: it is now 4*s.*; in some places 3*s.* 6*d.* Mr. Young adds, that the farmers in every part of it get more land ploughed in a day, by their own men and horses, than on any similar soil in any other part of the kingdom; which, he thinks, is not altogether to be attributed to the merits of the plough, though it is certainly a good one, nor to any superior activity in the horses: the cause is more in the men, who have been accustomed to keep their horses and themselves to a quick step, instead of the slow one common in almost every other district of the island.

And the Suffolk Report states, that in every part of the county this sort of work is done with a pair of horses, conducted with reins by the ploughman; and the quantity of land usually turned in a day is an acre upon stiff soils, and from one and a quarter to one and a half on sands. And it is added, that the ploughmen are remarkable for straight furrows, and also for drawing them by the eye to any object, usually a stick whitened by peeling, either for water cuts,

cuts, or for new laying out broad ridges, called there *ſtatches*; and a favourite amuſement is ploughing ſuch furrows, as candidates for a hat, or pair of breeches, given by ale-houſe keepers, or ſubſcribed among themſelves, as a prize for the ſtraighteſt furrow. The ſkill of many of them in this work is remarkable. Such a mode ſhould be practiſed in other diſtricts of the kingdom.

In the Hertfordſhire Report it is remarked, that the price of ploughing about Hatfield amounts to 11*s.* and 12*s.* an acre; twenty years ago, 7*s.* were paid; all is done with four horſes and a driver: 20*s. per* acre have been paid in the new incloſure at Cheſhunt. And that in the 17 acres of experiment ground of the marchioneſs of Saliſbury, the cultivation was began by a powerful trench ploughing, 18 inches deep. Mr. Stephenſon, the manager, who, having been bred a gardener, had the farmer's beſt education, knew that her ladyſhip intended to cultivate parſnips, carrots, cabbages, and other plants demanding deep tillage, and very wiſely began on garden principles. He remarks, that in general, in Hertfordſhire, there is a deficiency in not ploughing to a greater depth: they have a prejudice againſt it, and think land ruined that is ſtirred deeper than common. It is admitted that the firſt crop will ſometimes ſuffer in ſpots, but the ſucceeding ones make ample amends. Barley has been ſown on trench-ploughing, and with ſucceſs; in a dry ſeaſon it grew well, while that for which the land had been indifferently prepared ſtood ſtill.

Mr. Pratchet of Hatfield having aſſerted that he would readily give for ploughing his land once over 12*s. per* acre, and that he was ſure it coſt him more, put down the particulars on which he founded his opinion, and his calculations are theſe:

Expences *per* Week.

	£	*s.*	*d.*
Four horſes, ſeven buſhels of oats, at 4*s.* -	1	8	0
Eight truſſes of hay, at 5*l.* - - - -	1	2	2
Ploughman - - - - - -	0	15	0
Driver - - - - - - - -	0	12	0
Wear and tear, plough and harneſs - -	0	6	0
	4	3	2

It is added, that they plough five roods *per* day, when they break up their land, and one acre and a half when they give it a ſecond, or any ſubſequent ploughing; and that at ſeven acres and a half *per* week, the expence amounts to 11*s.* and 1*d. per* acre, beſides the wear of the horſes; at nine acres, it amounts to 9*s.* 2½*d.* But the above eſtimate of Mr. Pratchet is drawn from the conſideration, that this includes none of the time when the horſes are unemployed, which is a very material point, and adds largely to the expence when they work; on a wet-land farm particularly, the time thus loſt is conſiderable.

Mr. Cook, from near Colcheſter in Eſſex, bailiff to the duke of Bridgewater, is of opinion, however prejudiced in favour of two-horſe ploughs, that they could not break up for a fallow the flinty clayey loams of this county; but that, after one ploughing, they are fully equal to the following tillage. And that about Hitchin, they break up with the common Hertfordſhire plough; but in ſtirring, uſe the ſwing-plough with three horſes, and ſometimes with two. And that at Mortgrave, near Hitchin, where Mr. Green is ſettled, who came from near Clare, in Suffolk, about four years ago, this farmer never uſes more than two horſes in a plough, and does his work juſt as well as the natives with four: he ſucceeds, and is ſuppoſed to be a very thriving man. Some of his Suffolk ideas, however, are, Mr. Young obſerves, ſaid not to have anſwered ſo well, particularly the making compoſts with ditch earth: this he has given up, and now goes to London for manure, like others. And Mr. Sedgewick recommends a practice in ploughing broad lands with the common plough, to leave two or four furrows for the ſmall narrow plough, to finiſh the lands; by which means, there are channels on the ſlopes of the open thoroughs to catch ſeeds; whereas, with the great plough, the ſeed rolls into thoſe thoroughs. But Mr. Parker of Munden uſes the foot-plough of Middleſex, as preferable to the great Hertfordſhire wheel-plough, and can break up flinty ſtrong land with it as well as the other performs it. Caſes very rarely happen, in which the county plough has the advantage. He has a great opinion of deep ploughing; never has the leaſt objection to any depth, nor ever yet checked his men for going too deep. His common depth is nine inches. This he has practiſed 23 years on good loamy land in Huntingdonſhire, and here on the gravels and flints of Hertfordſhire. He has never loſt a crop by it, but met with an unvarying ſucceſs; and is clearly of opinion, that at this time of day it ought not to be made a queſtion, but received as an admitted fact. He does not limit his ploughs to nine inches, for he would like twelve better, if eaſily attainable. It is added, that he has no idea of burying dung, but ploughs it in nine inches deep, and would plough it in deeper; for he is well aſſured from experience, that nothing is loſt: and a great advantage of depth is, that one ploughing, given deeply and clean, is of more effect and better than two, or even than ten, ſuch ſcratchings as are called ploughings often in this county; but the harrows in *cleaning* ſhould, on loamy ſoil, be as deep as the ploughing. Mr. King of Barkway, it is remarked, who has Suffolk connections, ploughs with a pair of horſes and no driver, and does as much and as well as his neighbours with four.

On their moſt retentive clays at Albury they are extremely attentive never to go on in wet weather: the ſoil is ſtiff and tickliſh, and if touched when too moiſt, is greatly injured. This is a fact which is very general in moſt parts of the kingdom, on ſuch lands.

In every part of Hertfordſhire they have a method of ploughing, of which they are very fond, called *combing*, or *hacking*. A field that lies on flat or broad lands is half ploughed acroſs, by beginning with a furrow, and returning; the plough doubles the breadth of it by a ſecond furrow, the contrary way from the former, leaving a very ſmall baulk, juſt ſufficient to give ſteadineſs to the plough, by a purchaſe againſt the unſtirred land, which is equally well effected by leaving no baulk, but by going two inches deeper on the land ſide. Then the plough, returning for the third time, throws back the laſt turned furrow, taking up earth enough under it to clean plough the whole land, if wanted, or to do it at ſuch ſpaces as to whole plough, or half plough the field; but if combed cloſe, the ſurface is left in regular narrow ridges, called combs. This operation, with a little difference in the execution, is called ribbling in Suffolk. It appears a good hold for the harrows. The writer of the Hertfordſhire Report ſaw it well executed at ſir John Seabright's, at Beechwood, who underſtands the Hertfordſhire tillage well. And bouting, as it is called, is the lapping of two furrows together, by forming narrow ridges, a bout in each; then they are reverſed in the ſame manner by ſplitting; after that, they plough down by one furrow in the centre of the ridge, and ſo leave it for harrowing:

rowing: ſome time elapſes between each operation. In breaking up, they do an acre a day, and ſometimes more.

It is ſtated in the Corrected Report of the County of Eſſex, that the ploughs which are employed there are both thoſe of the ſwing and wheeled kinds; the latter generally on dry land, and the former on wet: but that in ſome diſtricts, ſwing-ploughs are uſed on all ſoils. That in general the plough-team is two horſes, driven by the ploughman by means of a cord; and that a common addition is a perpendicular iron faſtened to the beam, with two holes to keep the cord from entangling with the plough or whippletrees. But that upon ſtrong land, three horſes abreaſt are not uncommon, when the work is hard, though ſtill without a driver. Further, that the uſual day's work is an acre; at buſy ſeaſons, and for good managers, five roods are ſometimes done. Scarcely any common farmers uſe oxen; there are ſuch caſes, but they are very few: ſome gentlemen have them. The ploughing is in general extremely well performed in this county, which abounds with ſkilful and accurate ploughmen. The reporter has walked over 40 acres of wheat freſh put in, eying the land carefully, and not diſcovering a ſingle falſe furrow; no variations in the breadths of the ſtitches, or of the furrows; no depreſſions, nor any variations in the curvatures of the ſtitches. But they do not plough ſo deep as in Kent, nor ſo flat as in Norfolk; nor is it their wiſh to do ſo. The number of ploughings for different crops are in moſt places great, as from four to eight, or more; and as to the depth of ploughing, ſome prefer it when done deep, others when more ſhallow. In the iſland of Foulneſs, they break up for fallows ſix to ſeven inches deep; but ſome farmers ſhallower. Mr. Vaſſal of Eaſtwood, in Rochford hundred, ploughs eight or nine inches deep; and Mr. Wood, who managed Rochford-hall, after the death of the late Mr. Wright, trench-ploughed ſeveral fields, which were the worſe for it, relative to the wire-worm. The preſent Mr. Wright ploughs his fallows only a fair depth, and is convinced that it is better, as he has had much better crops from ſhallow tillage. A neighbour of his, after ten years of deep ploughing, got at firſt nothing from it but weeds and wire-worm. Wild oats abounded much. He left off the practice, and then got much better crops.

At Little Wakering, Dr. Aſplin, and many others, plough the firſt earth of a fallow very ſhallow, and get deeper every time; other earths, not in fallowing, ſhallow. But as to the depth of ploughing for fallows, it muſt depend upon the ſoil; but the beſt farmers like to go deep enough to chip up the dead ſoil now and then, and ſhew it a little upon the ſurface, after all is finiſhed.

In the work of ploughing here, ſome think the laying the furrows flat the beſt; but others prefer feather-edged furrows, as covering the ſeed better in harrowing: and this is the more general opinion. At Burnham, Mr. Ketcher does not approve of feather-edged ploughing; and he thinks flat furrows beſt on wet land, as well as on dry. But Mr. Tabrum, at Margaretting, not only approves feather-edged work, but thinks it eſſential for giving moulds to cover the ſeed.

In regard to the expence of ploughing in this diſtrict, in all the ſtrong rich clays at Bradfield, and around by the coaſt to Clackton, it is 8*s.* an acre. On the wet loams at Dunmow, three horſes, a man, and boy, for the firſt and ſecond earths of a fallow, by the acre, 7*s.* At Snorum, from 8*s.* to 9*s.* each ploughing; the ſoil very ſtiff. Mr. Ruſh, at Latchingdon, gives 9*s.*; at Rochford, 10*s.* 6*d.*; at Raleigh it was formerly 5*s.*, is now 8*s.*; at Thorndon, 10*s.*; at Margaretting, the common hiring price is 10*s.* 6*d.*; and at Toppesfield, Mr. Eley reckons it worth 8*s.* with three horſes; 6*s.* 6*d.* with two. They plough barley-fallows five or ſix times.

At Little Wakering, Dr. Aſplin uſed formerly to contract with one labourer for all the tillage of his farm, at 2*s.* an acre for ploughing, 6*d.* for harrowing, and 2*d.* for rolling. More work was done, always five roods ploughed *per* day, but he left it off on account of the ſhallowneſs and wide furrows.

At Jeſtworth, in Oxfordſhire, according to the report of that diſtrict juſt publiſhed, they plough with four horſes, and do an acre a day. In the ſouth-eaſtern diviſion of the county, a party of farmers agreed that an acre is the general quantity that ſhould be ploughed in a day by a team; but many ploughs go out for three roods. The expence was thus reckoned.

	£	*s.*	*d.*
Four horſes, $1\frac{1}{2}$ *cwt.* of hay per week, at 4*s.* 6*d.* each - - - - -	1	4	0
One buſhel of oats *per* horſe, at 3*s.* 6*d.* -	0	14	0
Chaff, 2*s.* *per* week - - -	0	8	0
Decline of value - - - -	0	4	0
	2	10	0
Per diem - - - -	0	7	$1\frac{1}{2}$
Wear and tear - - - -	0	2	6
Man and boy - - - -	0	2	6
	0	12	$1\frac{1}{2}$

However, on caſting up the account, they obſerved that it was too low, for an acre of land could not be ploughed under 14*s.*

At Wormſley, &c. horſes are allowed 20lb. of hay *per* diem, and a buſhel of oats *per* week; more for extra work. They plough with three or four, and do an acre a day. Three and four horſes are likewiſe employed in moſt other places, but ſome have tried two, though this is only ſeldom done. The ſame quantity of land is uſually ploughed in the day.

About Adderbury, it has been agreed by ſeveral very good farmers, that it is right to plough a ſtubble in autumn for a fallow, deep; five inches conſidered as deep ploughing. Alſo at and about Thumley, they are of the ſame opinion, when they break up for the firſt time in May. Mr. Edmonds thinks, that beans do beſt on deep ploughing; but the after crops may ſuffer for want of due tillage being given to ſuch additional depth. If deep, it ſhould be continued. Mr. Cozins, of Golder, ploughs eight inches deep for beans, and alſo in the firſt ploughing for a fallow. Mr. Newton, of Crowmarſh, likewiſe ploughs deep for beans and turnips; but thinks that clover land cannot be ploughed too ſhallow for wheat. At Mungwell, the biſhop of Durham ploughs for the moſt part according to the ſtaple of the ground, which is very ſhallow. He generally goes as deep as the ſtaple will admit. His lordſhip gained exceedingly by ploughing one inch deeper than the farmer before him had done; and which has gradually become an addition to the ſtaple and the ſoil.

Mr. Percey thinks, that they are apt to plough too much; the leſs they plough their land the better. A good farmer will plough enough to keep it clean; and all beyond that is bad. Hence, it is ſuppoſed, that land may be ploughed too much.

On

On the rich ſands at Adderbury, they do not plough more than four inches deep at any time, except on the little clay land they have, at the firſt breaking a fallow.

Mr. Davy of Dorcheſter ploughs as deep as he can for beans; but as ſhallow as poſſible on clover lays for wheat.

The rates of ploughing in moſt of the other diſtricts, both in the ſouth and the northern parts of the kingdom, ſtand equally high with theſe; and in ſome they are conſiderably higher, as more ſtrength of team is employed.

There are many other modes of ploughing practiſed in different counties, but it is not neceſſary to deſcribe them here. See Tillage.

Ploughing *in Green Crops*, the proceſs of turning down various ſorts of vegetable crops in their green or moſt ſucculent condition. It is a method of practice that has been employed for a great length of time on the continent, though little practiſed here by the farmers. The reaſon of which is probably, that the ſoils are in moſt diſtricts too wet and heavy for its being had recourſe to with advantage; the light and more friable kinds of land are moſt adapted for improvement in this way, as in ſuch the green materials undergo decompoſition much more readily, and become more quickly in the proper ſtate for affording the ſupport of crops. In ſome clayey ſoils, the putrefaction of ſuch materials is retarded in ſuch a way, that little or no benefit can be derived from their uſe. But in ſuitable ſoils, crops of the green kind, ſuch as buck-wheat, tares, clover, rape, and where ſown for the purpoſe, peaſe or beans, &c. may be uſed with advantage, being turned in as a preparation for wheat-crops, without the expence of a fallow. Where employed in this way, the crops, as obſerved above, ſhould always be turned down when in their moſt luxuriant ſtate of growth, and the ſoil rather dry, in order that a ſpeedy decompoſition and decay may be undergone. It has been ſuggeſted, that advantages may be gained in this view, by the application of ſmall proportions of calcareous ſubſtances in their cauſtic or more active ſtate over them before they are turned down. And that the economy of this practice muſt chiefly depend upon the ſavings in cartage, and the labour of preparation, which in other ſorts of manure is often very heavy. Mr. Young, in his Survey of Lincolnſhire, ſtates, that this practice, after having been attempted, appears to have been given up from its not fully anſwering the purpoſes for which it was intended, probably for the reaſons ſtated above. But it is a mode of huſbandry that Mr. Donaldſon ſtates to have been had recourſe to with ſucceſs in Warwickſhire, and which he conſiders as, beyond all others, the moſt economical. The expence of the ſeeds is almoſt the whole of what attends the practice. It is now little had recourſe to any where.

In the county of Eſſex, Mr. Hardy, of Bradfield, had a field of clover, part of which was mown twice, and part but once; the ſecond growth being kept until it was in bloſſom before feeding, when hogs, &c. were turned in, who trampled down five times as much as they ate, which was ploughed in for wheat: and where this latter management took place, gave by far the ſtouter wheat: and it is ſaid, that it ſhould be remarked that through all the parts of Tendring hundred, this huſbandry of trampling ſecond crop clover apparently to waſte is very general, and the opinion entertained of its merit is high. Lord Braybrook ſows cole for ploughing in November, and his bailiff, Mr. Nockold, aſſured the reporter that he could ſee to an inch in the barley where this management takes place. If the crop be high he mows it firſt, but this is for want of a ſkim-coulter, which would do it better ſtanding. Mr. Clayden, a very ſpirited tenant on the Audley-End eſtate, is in the ſame huſbandry. Corrected Agricultural Report of the County of Eſſex.

Ploughing in green crops is frequently practiſed by ſome of the beſt farmers bordering on the White-horſe hills, in Berkſhire, and found much leſs expenſive than carrying dung from the yard. Vetches, buck-wheat, rye, &c. are there chiefly employed for this purpoſe. Corrected Berkſhire Report.

PLOUGHMAN, in *Huſbandry*, the perſon who guides the plough, in the operation of tilling or tillage.

Ploughman's *Spikenard*, the Engliſh name of a genus of plants called by the botaniſts *conyza*; it is likewiſe called by us *flea-bane*. See Conyza.

PLOUGUENAST, in *Geography*, a town of France, in the department of the North Coaſts, and chief place of a canton, in the diſtrict of Loudeac; 7 miles N.N.E. of Loudeac. The place contains 3189, and the canton 12,503 inhabitants, on a territory of 132½ kiliometres, in five communes.

PLOUGUERNEAU, a town of France, in the department of the Finiſterre, and chief place of a canton, in the diſtrict of Breſt; 13 miles N. of Breſt. The place contains 6430, and the canton 15,033 inhabitants, on a territory of 152½ kiliometres, in 6 communes.

PLOUHA, a town of France, in the department of the North Coaſts, and chief place of a canton, in the diſtrict of St. Brieuc; 12 miles N.N.W. of Brieuc. The place contains 4145, and the canton 10,756 inhabitants, on a territory of 125 kiliometres, in 8 communes.

PLOUZE'VEDE, a town of France, in the department of the Finiſterre, and chief place of a canton, in the diſtrict of Morlaix; 8 miles S.W. of St. Pol de Leon. The place contains 2364, and the canton 11,436 inhabitants, on a territory of 130 kiliometres, in 6 communes.

PLOWMAN's Islands, a cluſter of iſlands, forming a part of Chu-ſan iſlands (ſee Chu-san), which are inhabited, and contain ſeveral ſpots of beautiful verdure; but not a ſingle ſhrub, except a very few dwarf fruit-trees, oak, and Weymouth pine. The rocks on theſe iſles are of the ſame nature with thoſe of the Ladrones; with the addition, in ſome parts, of perpendicular veins of white, and of blue and white ſpar. The Lion, one of the ſhips belonging to lord Macartney's embaſſy, moored between the Plowman and Buffaloe's Noſe iſlands: and found a moſt excellent harbour, ſecure from all winds, and the holding ground ſo good, that it required the whole ſtrength of the ſhip's crew, with the aſſiſtance of every purchaſe, to weigh the anchors: the depth of water being from 12 to 22 fathoms. The tide riſes about 12 feet, and runs at the full and change of the moon, 2½ miles an hour. Its latitude is 29° 45′ S., and longitude 121° 26′ E. The ſhip was ſupplied from theſe iſlands, at moderate rates, with bullocks, goats, and fowls; and from ſome of the ſurrounding boats with a variety of excellent fiſh. Staunton's Emb. to China, vol. i.

PLOWS, in *Agriculture*, a provincial term ſignifying ploughed ground, either in clover or open fields.

PLUCHE, Antony, *Abbé*, in *Biography*, an elegant writer, was born at Rheims in 1688. Having paſſed through the uſual courſe of education, he was appointed profeſſor of humanity in the univerſity of his native place, and two years afterwards of rhetoric, at which time he entered into holy orders. Some years afterwards he went to Paris, where he gave lectures in geography and hiſtory. In that capital he acquired a name among men of letters, by his popular work entitled "Spectacle de la Nature," of which the firſt volume appeared in 1732, and which was carried on to nine volumes. It contains a view of the moſt intereſting facts in natural hiſtory,

history, as they were then known, in the form of dialogue. The dialogue is not well kept up, though few works have been more read, and it was tranflated into various languages. His next publication was "Hiftoire du Ciel," in two vols. 12mo., of which the firft volume is chiefly mythological: the fecond relates to the formation of the world, and concludes with a confirmation of the Mofaic account of the creation. In 1750, he publifhed a treatife, entitled "The Truth of the Gofpel demonftrated." As a philologift, he is diftinguifhed by his "Mecanique des Langues, et l'Art de les Enfeigner," which is faid to be a very ufeful and judicious treatife. He died in 1761, at the age of 73, leaving behind him the character of a truly virtuous and refpectable man. Two of his pofthumous pieces were publifhed after his death, entitled "Concorde de la Geographie des differens Ages:" and "Harmonie des Pfeaumes, et de l'Evangile."

PLUCKART BAY, in *Geography*, a S.E. branch of Loch Ewe, on the W. coaft of Scotland. N. lat. 57° 45'. W. long. 5° 34'.

PLUCKENIN, a town of America, in Somerfet county, New Jerfey; 28 miles N. of Princeton. It carries on fome trade.

PLUDENTZ, a town of Germany, and capital of a county of the fame name, fituated on the Ill. In 1533 it was almoft deftroyed by an earthquake, and in 1638 was wholly burnt down; 62 miles W. of Infpruck. N. lat. 47° 3'. E. long. 9° 8'.

PLUDESCH, a town of Germany, in the county of Pludentz; 6 miles N. of Pludentz.

PLUE, LA, or *Rainy Lake*, a lake of Upper Canada, lying W. by N. of lake Superior, and E. by S. of the lake of the Woods. The Narrows are in N. lat. 49° 3' 2", Fort lac la Plue in 48° 35' 49", ifland Portage, 50° 7' 31", at the Barrier, 50° 7' 51". W. long. 95° 8' 30".

PLUE, *La*, a river forming a communication between lake La Plue and the lake of the Woods.

PLUG, a large wooden peg, with which to ftop the bottom of a ciftern, cafk, pipe, or the like.

PLUG, in *Ship Building*. *Haufe-plugs* are pieces of timber trimmed to the fize of the haufe-holes, fo as to keep out the water. *Shot-plugs* are formed like the fruftum of a cone of various fizes, in proportion to the holes made by the different fizes of fhot which may penetrate the fhip's fides in time of action. The latter are fometimes made of tallow and junk, or oakum, made hard together, and are thruft or driven into thofe fhot-holes, to prevent leaking: accordingly they are always ready for this purpofe.

PLUKENET, LEONARD, in *Biography*, "a learned, critical, and laborious botanift," as Dr. Pulteney juftly denominates him, was the contemporary and rival of PETIVER, fee that article; and laboured, with ftill more ardent, as well as exclufive, affiduity, to collect and to delineate the vegetable productions of nature. His origin and native country, as well as the place of his education, are unknown. He has indicated 1642 as the date of his birth, and we know that he furvived the fixty-third year of his age, but there is no precife record of his deceafe. A handfome portrait of him, at the age of forty-eight, is prefixed to his *Phytographia*, with the title of Doctor of Phyfic, and his arms; ermine, a bend dexter engrailed, gules. It is not known where he took his degree. His name feems to betray a French extraction, *plus que net*, and has been latinized *plus quam nitidus*. He refided in Old Palace-yard, Weftminfter, where he appears to have had a fmall garden; but as Dr. Pulteney fought in vain for his name, in feveral lifts of the College of Phyficians, printed in the firft years of the 18th century, as well as in thofe of the Royal Society, of the fame date, it fhould feem that he was not then eminent, either as a medical practitioner, or a natural philofopher. His motto, an anagram of his name, *ut pené n[illegible] ardet*, well expreffes the zeal with which he devoted himfelf to his favourite ftudy; while another motto in the fame page, over a burning candle, *aliis inferviendo confumor*, and a fubfequent one, to the fourth part of his work, *nil nifi præmia defunt*, evince that his worldly recompence was not adequate to his wifhes or expectations. Dr. Pulteney has difcovered that Plukenet had a fon Richard, who was a ftudent at Cambridge in 1696; and the *Almageftum* contains fome verfes written by another fon, Robert, at Eton fchool; which is all we know of his family or connections. He publifhed his early works at his own expence, but was affifted afterwards by trifling fubfcriptions. Towards the clofe of his life he is faid to have experienced royal patronage, to have obtained the fuperintendency of the garden at Hampton-court, and the title of Royal Profeffor of Botany; all from the favour of queen Mary. Three of the fections of his *Phytographia* are feverally dedicated to bifhop Compton, the firft earl of Portland, and king William III. That he enjoyed the friendfhip of Uvedale, who was his fellow-ftudent; and the high commendation of Ray; are fufficient proofs of his perfonal and fcientific merits. The beginning of the *Almageftum* teftifies his elevated piety, which at the end degenerates into the orthodox ftyle of the day. That he was fkilled in the learned languages, and that his correfpondence was very extenfive, appears from almoft every page of his works; and there are many particular parts which fhew his refearches to have been deep, and conducted with confiderable ability. It is to be lamented that fome of his latter pages betray a feverity of ftricture, on the literary labours of Sloane and Petiver more efpecially, of which we have already fpoken in the life of the latter, and of which more may be faid hereafter when we come to fpeak of Sloane. Plukenet was, apparently, a man of more folid learning than either of thofe diftinguifhed writers, and having been lefs profperous than either, he was perhaps lefs difpofed to palliate their errors. As far as we have examined, his criticifms, however fevere, are not unjuft.

Thefe are all the circumftances we can find, illuftrative of the life or character of Plukenet. We fhall now offer a few remarks upon his works.

Having collected a vaft Herbarium, for the time in which he lived, not only by means of his various correfpondents, but alfo from the treafures that were then daily pouring into the gardens about London, his object was to publifh a catalogue of the whole, accompanied by figures of the new or rare fpecies. The firft part of this defign was executed in his *Almageftum Botanicum*, which, like all his other publications, is in quarto, making a handfome volume of 404 pages, dated 1696. Its arrangement is alphabetical, according to the generic names at that time received, and adopted from Bauhin and other old authors, though not without many corrections and alterations made by himfelf in this department. Each plant is diftinguifhed by a fpecific definition, either adopted in like manner from his predeceffors, or new-modelled by himfelf; and all the fynonyms he could collect are fubjoined. No ideas of fyftematical arrangement feem to have entered into his contemplation, at leaft in the plan of this work. There are paffages in his writings which fhew he had occafionally thought on that fubject, nor could it altogether efcape a man of fo much reading; but it was by no means one of his primary objects. Thefe were rather fpecific diftinctions of plants, their fynonyms, and their hiftory. This work is faid

faid to contain about 6000 fpecies, of which its author fuppofed 500 to be new. Of thofe 6000, many are now confidered as varieties, being merely differences founded upon colour, or on double or fingle flowers; but if Plukenet erred in thefe particulars, he erred in common with all the botanical world at that period.

The *Phytographia* of our author was anterior in date to the above work, and yet is rather to be confidered as an accompaniment of the *Almagestum*. It confifts of 350 plates, engraved by various hands, each plate containing figures of five, fix, or more, plants, chiefly, if not altogether, done from dried fpecimens, with various degrees of merit. If thefe figures feldom rife to any great excellence of botanical precifion, they are at leaft original, and not only free from the faults of copies, fo copioufly difplayed in the plates of Morifon and fuch authors, but alfo tolerably exempt from grofs miftakes of their own. Of their beauty little can be faid, but the work improves as it advances. Being fo generally cited by fucceeding authors, efpecially Linnæus, it is indifpenfible to every botanic library. This book came out in four parts, of which the firft and fecond were publifhed in 1691, the third in 1692. The plates of thefe have the names, and many fynonyms, of each plant engraved at the bottom. The fourth part, which commences with tab. 251, and was publifhed in 1696, wants this ufeful appendage, and moft of its figures are deftitute of any reference. They are however cited in the *Almagestum*, and fome of them likewife refer to that work; but in fo obfcure and difficult a manner, that few perfons take the trouble of fearching them out, or of citing them correctly in their own publications. Thofe who inveftigate the matter, will find feveral plants, fuppofed to be of recent introduction and hitherto no where delineated, which were known to Plukenet; though his references are often fo faulty, as to damp our ardour of enquiry, by the needlefs difficulties they throw in our way.

In 1700 appeared the *Mantissa*, or appendix to the *Almagestum*, confifting of 192 pages, with a copious index to both works. This publication comprehends above 1000 new plants, with numerous obfervations and corrections relating to the former. Some of Plukenet's criticifms difplay great learning; as what concerns the Gopher, or Juniper tree, of the bible, firft book of Kings, chap. xix. ver. 4; though he errs in referring the Barbadoes Juniper to this oriental plant; fee his Mant. 109. Commentators have not been fufficiently attentive to botanical geography, on many occafions.

In 1705, Plukenet publifhed his laft work, the *Amaltheum*, which is a fupplement to the other two, and compofed on the fame plan, confifting of 216 pages, with an index, and 103 plates, fome of which illuftrate the plants of the Mantiffa.

All thefe works were republifhed, with new title-pages, in 1720, and again, with a re-impreffion of the letter-prefs, in 1769, making four volumes all together. Gifeke publifhed a very incomplete Linnæan index to them at Hamburgh in 1779. The herbarium of Plukenet, containing about 8000 plants, having been bought by fir Hans Sloane, is now in the Britifh Mufeum. The original manufcript of his works was given by the late Mr. Hudfon to the writer of the prefent article. Pulteney's Sketches of Botany. Plukenet's Works. S.

PLUKENETIA, in *Botany*, was fo named by Plumier, after Leonard Plukenet, M.D.; fee the preceding article. Linnæus, in his *Critica Botanica*, p. 80, draws an analogy between the great fingularity of ftructure in the flowers, and the peculiarity of Plukenet's character as a botanift; which idea does not feem to us fo happy as many of our great mafter's comparifons. Plukenet's works have no remarkable excentricity about them, but are, on the contrary, plain matter of fact, interfperfed with laborious, but fober, criticifm.—Plum. Gen. 47. t. 13. Linn. Gen. 501. Schreb. 652. Willd. Sp. Pl. v. 4. 514. Mart. Mill. Dict. v. 3. Sm. Nov. Act. Upfal. v. 6. 1. Ait. Hort. Kew. v. 5. 324. Juff. 392. Lamarck Illuftr. t. 788.—Clafs and order, *Monoecia Monadelphia*. Nat. Ord. *Tricoccæ*, Linn. *Euphorbiæ*, Juff.

Gen. Ch. Male, *Cal.* Perianth of one leaf, in four deep, ovate, acute, equal, fpreading fegments. *Cor.* none. *Stam.* Filaments numerous, about 20, united in an imbricated manner, awl-fhaped, very fhort; anthers fmall, fmooth, of two tumid furrowed lobes.

Female, on the fame plant, *Cal.* Perianth inferior, of one leaf, in four deep, ovato-lanceolate, acute, equal, fpreading, permanent fegments. *Cor.* none. *Pist.* Germen fuperior, four-lobed, depreffed, fmooth; ftyle very long, cylindrical, declining, four-cleft at the fummit; ftigmas four, capitate, globofe. *Peric.* Capfule four-lobed, coated, depreffed, fmooth, with dilated angles, of four cells, and eight elaftic valves. *Seeds* folitary, large, compreffed, with veiny wrinkles.

Eff. Ch. Male, Calyx in four deep fegments. Corolla none. Stamens numerous.

Female, Calyx in four deep fegments. Corolla none. Germen fuperior. Style fimple. Stigmas four, capitate. Capfule four-lobed; cells elaftic, with folitary feeds.

1. P. *volubilis*. Twining Plukenetia. Linn. Sp. Pl. 1423. Willd. n. 1. Ait. n. 1. (P. fcandens, hederæ foliis ferratis, fructu tetragono; Plum. Gen. 47. t. 13. f. 2. Ic. 220. t. 226.)—Angles of the capfule compreffed, keeled.—Native of the Weft Indies. Miller appears to have cultivated it at Chelfea, in 1739, but it had long been loft, till the late Hon. Mrs. Barrington received a living plant from Jamaica, which bloffomed in her ftove at Mungewell, near Wallingford, in 1795. The *stem* is twining, branched, round, leafy, fmooth; the young branches alternate, axillary, downy in their upper part. *Leaves* alternate, ftalked, fimple, heart-fhaped, pointed, about three inches long and half as wide, minutely ferrated, deep green, rather roughifh to the touch, naked, except a flight downinefs on the ribs at the back, reticulated on both fides with copious veins, and furnifhed with a pair of glands at the bafe. *Footstalks* about one-third the length of the leaves, channelled above, downy near the extremity. *Stipulas* in pairs at the bafe of the footftalk, very minute, triangular, acute, fmooth. *Flower-stalks* axillary, folitary, racemofe, downy, fquare at the bafe, round above, generally bearing one *female flower* at the bafe; confpicuous for its quadrangular *germen*, thick *style*, above an inch long, and large globofe *stigmas*; and above it a long compound downy *cluster*, of numerous fmall *male flowers*. Some branches terminate in a *cluster* of, partly axillary, *female flowers* only. All the *flowers* are green, and more fingular than beautiful. The *bracteas*, fcattered through the clufters, are fmall, ovate, acute, fmooth, membranous. *Fruit* the fize of a fmall walnut, green, depreffed, with four fpreading, dilated, compreffed, rounded angles, the valves feparating elaftically at the bafe. *Seeds* pale brown, large, greatly compreffed, lenticular, fomewhat bordered, rugged with elevated veins.

2. P. *verrucosa*. Warty Plukenetia. Sm. in Act. Upf. n. 2. Willd. n. 2. (P. volubilis; Linn. Suppl. 421. Am. Acad. v. 8. 264.)—Angles of the capfule terminated by two tubercles.—Native of Surinam, from whence our fpecimens were fent to Linnæus, who inadvertently referred them

them to the above original ſpecies. The *leaves* indeed ſcarcely differ, except in being very minutely and diſtantly toothed, rather than ſerrated. The *flowers* are ſomewhat ſmaller. The *capſules* differ moſt eſſentially, in being but one-fourth as large as the former, their lobes each tipped with a pair of warts, and not dilated nor keeled. The *ſeeds* moreover are obovate, not lenticular nor compreſſed.

3. P. *corniculata*. Horned Plukenetia. Sm. in Act. Upſ. n. 3. Willd. n. 3. (Sajor volubilis, fructibus corniculatis; Rumph. Amboin. v. 1. 193. t. 79. f. 2.)—Angles of the capſule compreſſed, tapering, pointed.—Rumphius deſcribes this as found wild in the woods of the diſtrict of Baguala, in Amboina, where it is known by the name of *Utta Pela*, or *Utta Tela*. The Dutch were accuſtomed to cultivate it, for the ſake of its leaves; which, when boiled with the milk of the cocoa-nut, prove an agreeable and delicate vegetable. Their name for the plant was *Sajor-Maccou*. The *ſtems* are long and ſlender, twining about the trunks of trees, and ſending off ſhort lateral alternate *branches*. *Leaves* much like both the foregoing, but according to the plate and deſcription, very evidently and diſtinctly ſerrated. Their ſcent is ſtrong like elder, but their taſte ſweet; at leaſt when boiled, for the natural affinities of the genus lead us to preſume that none of its ſpecies can be eaten without ſuch preparation. *Flowers* ſmall and green. There ſeem to be ſometimes two female ones, with a ſimple cluſter of numerous males above them. The *fruit* is very well deſcribed by Rumphius, as reſembling the ſtarry aniſe, *Illicium*, except in having but four cells, ſometimes only three, inſtead of ſix. "Each ſegment," ſays he, "is the ſize of the ſeed of *Ricinus*, with a very thin point, and theſe fruits, when ripe, fly aſunder, like the *Ricinus*, with an exploſion, throwing out their round, compreſſed, or lenticular ſharp-edged *ſeeds*." Nothing can more preciſely anſwer to the character of *Plukenetia*, and Linnæus actually confounded the plant in queſtion with his *P. volubilis*.

PLUM ISLAND, in *Geography*, an iſland on the coaſt of Maſſachuſetts, about nine miles long, and half a mile broad, extending from the entrance of Ipſwich river S., nearly a N. courſe to the mouth of Merrimack river, and ſeparated from the main land by a narrow ſound called Plum iſland river, which is fordable in many places at low water. It conſiſts for the moſt part of ſand blown into ludicrous heaps, and covered with buſhes bearing the beach plum. On the N. end ſtand the light houſes, and the remains of a wooden fort, built during the war for the defence of the harbour. On the ſea-ſhore of this iſland, and on Saliſbury beach, the Merrimack Humane Society has erected ſeveral ſmall houſes, furniſhed with fuel and other conveniences, for the relief of mariners who may be ſhipwrecked on this coaſt. The N. end lies in N. lat. 43° 4′, and W. long. 7° 47′.

PLUM-*Tree*, in *Botany*, &c. See PRUNUS.

PLUM, *American black cocoa*. See CHRYSOBALANUS.

PLUM *Bay*. See GUAIAVA.

PLUM, *Jamaica*, or *Hog*. See SPONDIAS.

PLUM, *Indian date*, *piſhamin*, *perſimon*, or *pitchumon*. See DIOSPYROS.

PLUM, *Maiden*. See CAMOCLADIA.

PLUMAGE, the feathers, or covering of birds; for the mechaniſm of which, ſee FEATHER.

PLUMAGE, in *Falconry*, is particularly underſtood of the feathers under a hawk's wing.

The falconers alſo give their hawks parcels of ſmall feathers to make them caſt: and theſe they call plumage.

PLUMARTIN, in *Geography*. See PLEUMARTIN.

PLUMAU, a town of Auſtria; ſeven miles N.W. of Hooren.

PLUMB, or PLUM, in matters of ſpicery. See CURRANTS and RAISINS.

PLUMB *Iſland*, in *Geography*, an iſland on the N.E. coaſt of Long iſland, in the ſtate of New York, annexed to Southhold in Suffield county. It contains about 800 acres, and ſupports ſeven families. It is fertile, and produces wheat, corn, butter, cheeſe, and wool. This iſland, with the ſandy point of Gardener's iſland, forms the entrance of Gardener's bay.

PLUMB *Point*, *Great*, lies on the S. coaſt of the iſland of Jamaica, and forms the S.E. limit of the peninſula of Port Royal, which ſhelters the harbour of Kingſton. *Little Plumb Point* lies weſtward of the former, towards the town of Port Royal, on the S. ſide of the peninſula.

PLUMB-*Line*, a term among artificers for a perpendicular line.

It is thus called, becauſe uſually deſcribed by means of a plumbet.

PLUMBAGINES, in *Botany*, the fourth natural order of Juſſieu's 7th claſs, immediately following his NYCTAGINES; ſee that article. The name is taken from one of the genera, and the characters are theſe.

Calyx tubular. *Corolla* of one or more petals, below the germen. *Stamens* definite, inſerted either below the germen, or into the corolla. *Germen* one, ſuperior; ſtyle one or many; ſtigma many. *Capſule* ſingle-ſeeded, with many valves at the baſe, hood-like. *Seed* ſtraight, inſerted by a thread-like ſtalk into the receptacle of the germen. *Corculum* oblong, flat, ſurrounded by a farinaceous albumen. *Stem* herbaceous, or ſomewhat ſhrubby. *Leaves* alternate.

The genera in Juſſieu are only two, *Plumbago* and *Statice*. Mr. Brown adds *Taxanthema* and *Aegialitis*.

PLUMBAGO, a name evidently derived from *plumbum*, lead, but whether it alludes to any colouring quality in the plant, or to the hue of its foliage, critics are not agreed. The latter ſeems conſiſtent with *P. europæa*, or Common Leadwort, whoſe leaves are of a very peculiar greyiſh-green. The *Polygonum Perſicaria*, with dark ſpots on its leaves, has ſometimes borne this name, for a ſimilar reaſon.—Linn. Gen. 86. Schreb. 114. Willd. Sp. Pl. v. 1. 837. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 1. 323. Brown Prodr. Nov. Holl. v. 1. 425. Sm. Prodr. Fl. Græc. Sibth. v. 1. 131. Juſſ. 92. Tourn. t. 58. Lamarck Illuſtr. t. 105. Gærtn. t. 50.—Claſs and order, *Pentandria Monogynia*. Nat. Ord. undetermined by Linnæus. *Plumbagines*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, ovate-oblong, tubular, with five plaits or angles, and five teeth, rough, permanent. *Cor.* of one petal, funnel-ſhaped; tube cylindrical, contracted upwards, longer than the calyx; limb in five ovate, rather ſpreading, ſegments. *Stam.* Filaments five, awl-ſhaped, unconnected with the corolla, encloſed within its tube; anthers ſmall, oblong, verſatile. *Piſt.* Germen ſuperior, ovate, very ſmall; ſtyle ſimple, the length of the tube; ſtigmas five, ſlender, ſimple. *Peric.* Capſule ovate, thin, of one cell and five incomplete valves. *Seed* ſolitary, ovate.

Obſ. We find no traces of the nectary, or valves ſupporting the ſtamens, deſcribed by Linnæus.

Eſſ. Ch. Corolla funnel-ſhaped. Stamens inſerted into the receptacle. Stigmas five. Capſule membranous, of one cell. Seed ſolitary.

1. P. *europæa*. Common Lead-wort. Linn. Sp. Pl. 215. Sm. Fl. Græc. Sibth. t. 191, unpubl. (P. Plinii; Ger. Em. 1254. Tripolium Dioſcoridis; Column. Ecphr. 160.

160. t. 161.)—Leaves clafping the ftem, lanceolate-oblong, rough. Stem ftraight, erect.—Native of the fouth of Europe. Perennial and hardy in our gardens, but not in general cultivation. The *ftem* is herbaceous, three feet high, upright, leafy, furrowed, with many ftraight upright flowering branches, each terminating in a fimple denfe *fpike*, of fmall pale-purple *flowers* with a briftly *calyx*. The *leaves* are alternate, numerous, recurved, oblong-lanceolate, obtufe, bluntly toothed, dull green, rough but not hairy; their bafe tapering, then dilated round the ftem or branch.

2. P. *lapathifolia*. Dock-leaved Lead-wort. Willd. n. 2. (P. orientalis, lapathi folio, flore minore albido; Tourn. Cor. 7.)—"Leaves clafping the ftem, lanceolate, fmooth. Stem divaricated."—Native of Iberia. *Stem* taller, with longer more fpreading branches; *leaves* much larger, fmooth; *flowers* about half the fize of the foregoing. *Willd.*

3. P. *capenfis*. Cape Lead-wort. Thunb. Prodr. 33. Willd. n. 3.—"Leaves ftalked, oblong, nearly entire; glaucous beneath. Stem erect." *Thunb.*—Native of the Cape of Good Hope.

4. P. *zeylanica*. Ceylon-Lead-wort. Linn. Sp. Pl. 215. Willd. n. 4. Ait. n. 2. Brown n. 1. (Lychnis indica fpicata, ocymaftri foliis, fructibus lappaceis oblongis, radice urente; Comm. Hort. v. 2. 169. t. 85.)—Leaves ftalked, oblong-ovate, fmooth, entire. Stem erect, round.—Native of the Eaft Indies, and New Holland. It flowers in the ftove from April to September. The *ftem* is rather fhrubby. *Flowers* white; with a long tube.

5. P. *rofea*. Rofe-coloured Lead-wort. Linn. Sp. Pl. 215. Willd. n. 5. Ait. n. 3. Curt. Mag. t. 230. (Radix veficatoria; Rumph. Amboin. v. 6. 453. t. 168.)—Leaves ftalked, ovate, fmooth, fomewhat toothed. Joints of the ftem tumid.—Native of the Eaft Indies; faid to have been introduced by Dr. Fothergill in 1777. It blooms in the ftove almoft all the year long; and is the moft favourite fpecies of its genus, on account of the delicate pale fcarlet of its *flowers*, which form compound clufters at the ends of the branches. The *ftem* is fhrubby, four or five feet high, flender, and requiring fupport. *Leaves* recurved.

6. P. *fcandens*. Climbing Lead-wort. Linn. Sp. Pl. 215. Willd. n. 6. Ait. n. 4. (Dentellaria lychnioides fylvatica fcandens, flore albo; Sloane Jam. v. 1. 211. t. 133. f. 1.)—Leaves ftalked, ovate, fmooth. Stem zigzag, climbing. Native of the Weft Indies. It was brought into the ftoves of this country very early, but is not much regarded at prefent, the *flowers* being white and not ftriking in their appearance. Sloane compares them to the common field Campion. The climbing, much more lofty *ftem*, diftinguifhes it from the two laft. Their *leaves* are variable, and afford no well-marked diftinction.

7. P. *auriculata*. Auricled Lead-wort. Lamarck Dict. v. 2. 270. Willd. n. 7.—Leaves ftalked, ovate-oblong, with fcaly dots beneath. Footftalks auricled at their bafe, and clafping the ftem.—Native of the Eaft Indies. *Stem* fhrubby, flender. *Leaves* obtufe, fmooth above; contracted at their bafe. *Flowers* in fhort terminal fpikes, refembling thofe of *P. rofea* in form, but in the dried fpecimen they had no appearance of a red colour. *Lamarck.*

8. P. *triftis*. Dark-flowered Lead-wort. Ait. n. 5.—"Leaves obovate, abrupt, fmooth.—Native of the Cape of Good Hope, from whence it was fent to Kew by Mr. Maffon, in 1792. This is a greenhoufe fhrub, flowering in May and June. We have feen no fpecimens of thefe two laft fpecies.

PLUMBAGO, in *Gardening*, contains plants of the herbaceous, flowering, perennial kinds, of which the fpecies cultivated are; the European leadwort (P. europæa); the Ceylon leadwort (P. zeylanica); the rofe-coloured leadwort (P. rofea); and the climbing leadwort (P. fcandens).

Method of Culture.—The firft fort is increafed by parting the roots in the autumn, when the ftems decay, and planting them in a dry foil. They fhould afterwards be kept clean from weeds, and have proper fupport.

The three other forts fhould be raifed from feeds, which fhould be fown in pots in the fpring, and plunged in hot-beds. They likewife may fometimes be raifed by planting flips and cuttings in pots, and plunging them in the fame forts of hot-beds.

Thefe are all ornamental flowering plants; the firft in the pleafure-grounds, and the others in pots among hot-houfe collections.

PLUMBAGO, in *Metallurgy*, a metalline recrement, feparated in the purification of gold or filver with lead, and fticking to the fides of the furnace.

This is otherwife called *molybdæna;* and has the fame virtue with litharge. See MOLYBDÆNA.

PLUMBAGO feems to have been ufed, among the *Ancients*, for *Black* LEAD (which fee), and employed in making pencils for defigning, &c.

The black lead ufed for this purpofe, called "plumbago," and alfo "carbure of iron," by Werner "graphit," the "fer carbure" of Haüy, is a fpecies of coal, or mineral carbon (fee COAL), of a dark iron black colour, paffing into fteel-grey, and occurs in mafs, in kidney-fhaped lumps, and diffeminated. It has a gliftening metallic luftre; its fracture is fmall, fomewhat curved foliated, approaching to fcaly, or granular uneven: in the great it is flaty. It occurs generally in granular or fcaly diftinct concretions; takes a polifh by cutting or rubbing; gives a dark lead-grey ftreak, and is unctuous to the feel, foft, and not very brittle. Spec. grav. 1.98 to 2.26. It does not flame when heated, nor can by itfelf to fupport combuftion. After long expofure to a high heat in a muffle, its carbon is burnt off, and its earthy and metallic part remains behind. If one part of plumbago, and two of very cauftic dry alkaline, be heated in a retort with the pneumato-chemical apparatus, the alkaline becomes effervefcent, hydrogenous gas is obtained, and the plumbago difappears. This experiment proves, that the fmall quantity of water contained in the falt is decompofed, and that its oxygen, by combining with the carbon of plumbago, forms the carbonic acid. The fulphuric acid does not act upon plumbago, according to Scheele. Pelletier has obferved, that 100 grains of plumbago, and four ounces of oil of vitriol, being digefted in the cold for feveral months, the acid acquired a green colour, and the property of congealing by a very flight degree of cold. The fulphuric acid diftilled from plumbago paffes to the ftate of the fulphureous acid; at the fame time that carbonic acid is obtained, and an oxyd of iron is left in the retort. The nitric acid has no action upon plumbago, unlefs it be impure. The muriatic acid diffolves the iron and clay which contaminate native plumbago. Meffrs. Berthollet and Scheele availed themfelves of this method to purify it. The liquor being decanted after digeftion upon the plumbago, the refidue is then wafhed and fubmitted to diftillation to feparate the fulphur. The muriatic acid alone has no action upon plumbago, but the oxygenated muriatic acid diffolves it; the refult being a true combuftion effected by the oxygen of the acid, and the carbon of the plumbago. If ten parts of the nitrate of pot-afh be fufed in a crucible, and one part of plumbago be thrown upon it by a little at a time, the falt will deflagrate, and the plumbago will be deftroyed. The matter which remains in the crucible confifts of very effervefcent alkali,

alkali, and a fmall portion of martial ochre. If plumbago be diftilled with muriate of ammonia, the muriate fublimes, coloured by the iron. All thefe facts prove that plumbago is a peculiar combuftible fubftance, a true charcoal combined with a martial bafis. The purer kind of plumbago, according to Scheele and Berthollet, confifts of about 90 *per cent.* of carbon and 10 of iron. An impure kind from Pluffier afforded Vauquelin

23	carbon

37	alumine
38	filex
100	

The brilliant charcoal of certain vegetable fubftances, more efpecially when formed by diftillation in clofe veffels, poffeffes all the characters of plumbago: and the charcoal of animal fubftances, poffeffes characters ftill more peculiarly refembling it. When animal fubftances are diftilled by a ftrong fire, a very fine powder fublimes, which attaches itfelf to the inner part of the neck of the retort. This fubftance may be made into excellent black-lead pencils. Carbon may be formed in the earth by the decompofition of wood, together with pyrites; but the origin of plumbago, fays M. Chaptal, is principally owing to the ligneous, and truly indecompofable, part of the wood, which refifts the deftructive action of water in its decompofition of vegetable fubftances. This mineral is found in primitive and tranfition rocks in England, Scotland, France, Spain, Germany, America, &c. Befides its ufe for pencils, the beft for this purpofe is that from Borrowdale, in Cumberland; it is fometimes ufed to lubricate machinery inftead of oil, and to protect iron from ruft. The hearths and plates of chimnies and other utenfils, which appear very bright, owe their colour to plumbago. For this purpofe Homberg long ago, *viz.* in 1699, directed 8lbs. of hog's-lard to be melted with a fmall quantity of water, with the addition of 4oz. of camphor. When this laft is fufed, the mixture is taken from the fire; and while it is yet hot, a fmall quantity of plumbago is added to give it a leaden colour. When this is to be applied, the utenfils muft be heated to fuch a degree, that the hand can fcarcely bear to touch them. In this ftate the compofition muft be rubbed on them, and afterwards wiped when the piece is dry. Thofe who prepare fmall fhot, ufe black lead to polifh or glaze it, by rolling or agitating them together with a quantity of plumbago. It is likewife ufed to make razor ftrops. When kneaded with clay, it makes excellent crucibles. One part of plumbago, three of argillaceous earth, and a fmall quantity of cow's dung very finely chopped, form an excellent lute for retorts; this lute is very refractory; and the glafs will melt with the coverings changing its form. Aikin's Dict. Chaptal's Chem. vol. ii.

Pomet fays, that plumbago was the fea-lead, *plumbum marinum*, of the ancients; who, he notes, took black-lead for a production of the fea, not a mineral, as it really is; but this is fcarcely credible.

Plumbago, in the *Hiftory of the Gems*, a word ufed by the Roman authors to exprefs a blemifh common to their worfe kinds, and greatly debafing their value. It was a fort of blueifh or blackifh deadnefs in the ftone, which mixed itfelf with the other colour, be that what it would, and rendered it dull and dead. The emerald was of all the gems the moft fubject to this fault; and in this cafe, its fine green colour was always rendered cloudy and blueifh; and in fome lights the ftone appeared of a dufky greyifh-blue, with no green at all in it. The Bactrian emeralds, which were in great efteem with the ancients, were often fubject to this imperfection; and thofe of Cyprus, taken out of the copper mines, though fubject to many other imperfections, were ufually quite free from this.

Plumbago, in *Mineralogy*, a name given by many authors to a fort of foffil, having very much the appearance of a lead-ore, but not fuch in reality.

It is called alfo galena, blende, and mock-lead. It is ufually of a plated texture, and dark blackifh-blue colour, like the lead-ores; but on trial it yields no metal. See Galena and Blende.

PLUMBARIA, in *Ancient Geography*, an ifland fituated on the coaft of Spain, near the promontory Dianium, according to Strabo.

PLUMBATÆ, among the *Ancients*, a kind of fcourge, the thongs of which were armed with lead.

Plumbatæ likewife fignified leaden balls, ufed by foldiers to annoy the enemy with; whence the foldiers were called *martiobarbuli*.

PLUMBERY, formed of *plumbum*, *lead*, the art of cafting, preparing, and working lead; and of ufing it in buildings, &c. See Lead.

The lead ufed in plumbery is furnifhed from the leadworks in large ingots, or blocks, called pigs of lead, ordinarily weighing about a hundred pounds a-piece.

As this metal melts very eafily, it is eafy to caft figures of it, of any kind, by running it into moulds of brafs, clay, plaifter, &c. But the chief article in plumbery is the fheets, and pipes of lead. They are thefe which make the bafis of the plumber's work in building; the procefs of thefe, therefore, we fhall give a defcription of.

Method of cafting large Sheets of Lead.—The lead deftined for this ufe is melted in a large cauldron or furnace, ufually built with free-ftone and earth, fortified on the outfide with a maffive of fhards and plaifter. At the bottom of it is a place funk lower than the reft, in which is difpofed an iron pot, or pan, to receive what may remain of the metal after the fheet is run. The furnace is fo raifed above the area of the floor, as that the iron pot juft refts on it.

To ufe the furnace, they heat it with wood laid within it; that done, they throw in the lead at random with the burning coals, to melt.

Near the furnace is the table or mould, on which the lead is to be caft. This confifts of large pieces of wood, well jointed, and bound with bars of iron at the ends. Around it runs a frame, confifting of a ledge or border of wood, two or three inches thick, and one or two high from the table, called the *fharps*. The ordinary width of the tables is from three to four feet; and their length from eighteen to twenty feet.

This table is covered with fine fand, prepared by moiftening it with a watering pot, then working it with a ftick; and at laft, to render it fmooth and even, beating it flat with a mallet, and planing it with a flip of brafs, or wood.

Over the table is a ftrike or rake of wood, which bears and plays on the edges of the frame, by means of a notch cut in either end of it; and is fo placed, as that between it and the fand is a fpace proportionable to the intended thicknefs of the fheet. The ufe of this ftrike is to drive the matter, while yet liquid, to the extremity of the mould.

At top of the table is a triangular iron peel or fhovel, bearing, before, on the edge of the table itfelf, and behind, on a treffel fomewhat lower than the table. Its ufe is in conveying the metal into the mould; and the defign of its oblique difpofition is, that it may by that means be able to retain the metal, and keep it from running off at the fore-fide, where

where it has no ledge. Some of these peels are big enough to hold fifteen or sixteen hundred weight of lead, and even more.

Things being thus difpofed, with a large iron ladle they take out the melted lead, coals and all, out of the furnace; and with this, mixed as it is, they fill the iron peel. When full, they take cut the coals, and clear the lead with another iron fpoon, pierced after the manner of a fcummer.

This done, they hoift up the lower part of the peel by its handle; upon which the liquid matter running off, and fpreading itfelf on the mould, the plumber conducts and drives it to the extremity of the table, by means of the ftrike, which the workman paffes along the ledges, and thus renders the fheet of an equal thicknefs.

The fheets thus caft, there remains nothing but to edge them, *i. e.* to planifh the edges on both fides, in order to render them fmooth and ftraight.

Method of cafting thin Sheets of Lead.—The table or mould here ufed is of a length or breadth at difcretion, only ledged on one fide. Inftead of fand, they cover it with a piece of woollen ftuff, nailed down at the two ends, to keep it tight; and over this they lay a very fine linen cloth. The feet of the table are uneven, fo that it does not ftand horizontal, but moderately inclined.

Great regard is, in this procefs, had to the lead while melting, that it have the juft degree of heat, fo as it may run well, yet not burn the linen. This they judge of by a piece of paper; for if the paper take fire in the liquid lead, it is too hot; and if it be not fhrunk and fcorched a little, it is not hot enough.

Being then in its juft degree, they have a ftrike, but different from that defcribed in the former article; as ferving both for peel and ftrike; both to contain and to conduct the liquid lead. It is, in effect, a wooden cafe without any bottom, only clofed on three fides. It is pretty high behind, but the two fides, like two acute angles, ftill diminifh to the tip, from the place where they are joined to the third or middle piece, where they are of the fame height with it; *viz.* feven or eight inches high. The width of the middle makes that of the ftrike, which again makes that of the fheet to be caft.

The ftrike is placed at top of the table, which is before covered in that part, with a pafteboard, that ferves as a bottom to the cafe, and prevents the linen from being burnt while the liquid is pouring in. The ftrike is fo difpofed on the table, as that the higheft part looks to the lower end of the table, and the two floping fides to the higher end.

The ftrike is now filled with lead, according to the quantity to be ufed; which done, two men, one at each fide the table, let the ftrike defcend down the table, or elfe draw it down with a velocity greater or lefs, as the fheet is to be more or lefs thick; the thicknefs of the fheet ftill depending on the promptitude with which the ftrike flides down the inclining mould.

The fine fmooth fheets of lead, thus made, are fometimes ufed between the joints of large ftones in great buildings, &c.

For the method of cafting pipes, without foldering, fee PIPE.

The folder which the plumbers ufe, is a mixture of two pounds of lead with one of tin. See SOLDER.

Plumber's work is commonly eftimated by the pound or hundred weight; but the weight may be difcovered by the meafure of it, in the manner below ftated. Sheet lead ufed in roofing, guttering, &c. is commonly between feven and twelve pounds weight to the fquare foot; but the following table fhews by infpection the particular weight of a fquare foot for each of feveral thickneffes.

Thicknefs.	Pounds to a Square Foot.	Thicknefs.	Pounds to a Square Foot.
.10	5.899	.15	8.848
.11	6.489	.16	9.438
$\frac{1}{9}$	6.554	$\frac{1}{6}$	9.831
.12	7.078	.17	10.028
$\frac{1}{8}$	7.373	.18	10.618
.13	7.668	.19	11.207
.14	8.258	$.2 = \frac{1}{5}$	11.797
$\frac{1}{7}$	8.427	.21	12.387

In this table the thicknefs is fet down in tenths and hundredths, &c. of an inch; and the annexed correfponding numbers are the weights in avoirdupois pounds, and thoufandth parts of a pound. So the weight of a fquare foot of $\frac{1}{10}$ or $\frac{10}{100}$ of an inch thick, is 5 pounds and 899 thoufandth parts of a pound; and the weight of a fquare foot to $\frac{1}{9}$ of an inch thicknefs is 6 pounds and $\frac{554}{1000}$ of a pound. Leaden pipe of an inch bore is commonly 13 or 14 pounds to the yard in length.

Examples.

1. How much weighs the lead which is 39 feet 6 inches long, and 3 feet 3 inches broad, at $8\frac{1}{2}$ lbs. to the fquare foot?

Decimals.	Duodecimals.
39.5	39 6
$3\frac{1}{4}$	3 3
118.5	118 6
9.875	9 10 6
128.375	128 4 6
$8\frac{1}{2}$	$8\frac{1}{2}$
1027.000	1024
64.1875	64
	$2\frac{5}{6}$
	$0\frac{17}{48}$
1091.1875	Anfwer $1091\frac{9}{48}$ lbs.

2. What coft the covering and guttering of a roof with lead, at 18*s.* the cwt.; the length of the roof being 43 feet, and the breadth or girth over it 32 feet, the guttering 57 feet long, and two feet wide; the former 9.831 lbs., and the latter, 7.373 lbs. to the fquare foot? Anf. 115*l.* 9*s.* $1\frac{1}{2}$*d.* Hutton's Menfuration.

PLUMBING, among *Miners*, a term ufed to exprefs the ufing a mine dial, in order to know the exact place of the work where to fink down an air fhaft, or to bring an adit to the work, or to know which way the load inclines when any flexure happens in it.

It is performed in this manner: a fkilful perfon with an affiftant, and with pen, ink, and paper, and a long line and a fun-dial, after his guefs of the place above ground, defcends into the adit or work, and there faftens one end of the line to fome fixed thing in it; then the incited needle is let to reft, and the exact point where it refts is marked with a pen: he then goes on farther in the line ftill faftened, and at the next flexure of the adit he makes a mark on the line by a knot or otherwife; and then letting down the dial again, he there likewife notes down that point at which the needle ftands in this fecond pofition. In this manner he proceeds from turning to turning, marking down the points, and

and marking the line till he comes to the intended place; this done, he afcends, and begins to work on the furface of the earth what he did in the adit, bringing the firft knot in the line to fuch a place where the mark of the place of the needle will again anfwer its pointing, and continues this till he comes to the defired place above ground, which is certain to be perpendicularly over the part of the mine into which the air-fhaft is to be funk.

PLUMBUM. See LEAD.

PLUMBUM *Corneum*, called alfo *Saturnus corneus*, in *Chemiftry*, is a metallic falt, formed by the precipitation of lead from its folution in nitrous acid with the marine acid, and all the neutral falts which contain it. It is thus called from its refemblance to the luna cornea. This falt may be made by other methods, and particularly by difengaging the volatile alkali from fal ammoniac by lead. In this way Mr. Margraaf makes the plumbum corneum, which he employs in the preparation of phofphorus. See LEAD.

PLUMBUM *Uftum*. See *Burnt* LEAD.

PLUME, a fet or bunch of oftrich feathers, pulled out of the tail and wings, and made up to ferve for ornament in funerals, &c.

PLUME, formed of *pluma*, *feather*, in *Falconry*, is the general colour or mixture of the feathers of a hawk, which fhews her conftitution.

When a hawk feizes her prey, and difmantles it of its feathers, fhe is faid to plume it.

PLUME, in *Botany*. See PLUMULA.

PLUME, *La*, in *Geography*, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the diftrict of Agen; 7 miles S.S.W. of Agen. The place contains 1588, and the canton 6633 inhabitants, on a territory of $127\frac{1}{2}$ kiliometres, in 10 communes.

PLUME *Alum*. See ALUM.

PLUMENAU, or PLUMLAW, in *Geography*, a town of Moravia, in the circle of Olmutz; 4 miles W. of Profnitz.

PLUMENTAAL, a town of Auftria; 4 miles W. of Ziftersdorf.

PLUMERIA, in *Botany*, was fo named by Tournefort, in honour of its difcoverer, the celebrated Father Plumier. (See PLUMIER, CHARLES.)—Tourn. Inft. 659. t. 439. Linn. Gen. 117. Schreb. 164. Willd. Sp. Pl. v. 1. 1242. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 2. 70. Juff. 145. Lamarck Illuftr. t. 173.—Clafs and order, *Pentandria Monogynia*. Nat. Ord. *Contortæ*, Linn. *Apocineæ*, Juff.

Gen. Ch. *Cal.* Perianth inferior, fmall, in five deep obtufe fegments. *Cor.* of one petal, funnel-fhaped; tube long, gradually dilated upwards, naked at the mouth; limb fpreading, in five deep, ovate-oblong, oblique fegments. *Stam.* Filaments five, awl-fhaped, from the middle of the tube; anthers converging. *Pift.* Germen fuperior, oblong, cloven; ftyles fcarcely any; ftigma double, pointed. *Peric.* Follicles two, long, pointed, tumid, bent downwards, drooping, each of one cell, and one valve. *Seeds* numerous, oblong, imbricated, winged with a membrane. *Receptacle* feparate, cylindrical.

Eff. Ch. Corolla contorted, funnel-fhaped: naked at the mouth. Follicles two, reflexed. Seeds with a membranous wing.

1. P. *rubra*. Red Plumeria. Linn. Sp. Pl. 306. Willd. n. 1. Ait. n. 1. Curt. Mag. t. 279. (P. flore rofeo odoratiffimo; Tourn. Inft. 659. Trew. Ehret. 11. t. 41. Jafminum indicum; Merian. Inf. Surinam. t. 8.)—Leaves ovate-oblong. Flower-ftalks downy, even.—Native of Jamaica and Surinam, where it is cultivated on account of the beauty and fragrance of its bloffoms, which come out before the leaves. Merian fays it is readily propagated, and grows rapidly. In our ftoves it bloffoms in July and Auguft. The *ftem* is thick and flefhy, forming a tall fhrub, or fmall tree, in the courfe of a few months, and abounding with milky juice. *Leaves* deciduous, fcattered, ftalked, a fpan long, and one and a half or two inches wide, oblong, fomewhat ovate or elliptical, pointed, entire, fmooth, with one thick rib, and many tranfverfe veins, connected by a fubmarginal line. We find no traces of the two glands on the *footftalks*, mentioned by Linnæus, after Browne. The *flowers* are numerous, in a terminal cymofe *panicle*, whofe ftalks, in all the fpecimens we have feen, are denfely downy. The *corolla* expands near two inches, and is rofe-coloured, with a yellow mouth.

2. P. *acuminata*. Sharp Eaft Indian Plumeria. Ait. n. 2. (Flos convolutus; Rumph. Amboin. v. 4. 85. t. 38.)—Leaves lanceolate, flat, taper-pointed. Flower-ftalks fmooth, even.—Native, as well as cultivated, in various parts of the Eaft Indies, being much admired for its beautiful and fragrant white *flowers*. Thefe, according to Rumphius, are fometimes candied with fugar. It was introduced at Kew, about 1790, by fir Jofeph Banks, and flowers there from June to September. The habit of the plant is like the laft, but the *corolla* is white with a yellow mouth; the *flower-ftalks* fmooth; and the *leaves* much more pointed. The tapering *leaves*, and lefs tumid or rugged *flower-ftalks*, diftinguifh this from the following, which the *flowers* moft nearly refemble.

3. P. *alba*. White Weft Indian Plumeria. Linn. Sp. Pl. 306. Willd. n. 2. Ait. n. 3. Jacq. Amer. 36. t. 174. f. 12. (P. flore niveo, foliis longis anguftis et acuminatis; Tourn. Inft. 659. Plum. Ic. 227. t. 231.)—Leaves lanceolate, revolute. Flower-ftalks fmooth, knotty above.—Native of the Weft Indies, on rocks by the fea fide. *Jacq.* It flowers in our ftoves in July and Auguft, but is more rare than the firft fpecies. Nothing can exceed the fragrance of the large and elegant white *flowers*, whofe infide, at the mouth of the tube, is yellow, as in the two preceding.

4. P. *obtufa*. Blunt-leaved Plumeria. Linn. Sp. Pl. 307. Willd. n. 3. Ait. n. 4. Aubl. Guian. v. 1. 259. (P. flore niveo, foliis brevioribus obtufis; Tourn. Inft. 659. Plum. Ic. 228. t. 231. Catefb. Carolin. v. 2. t. 93.) —Leaves obovate, obtufe, with a fhort point.—Native of South America and the Weft Indies. It flowers in the ftove in July, according to Mr. Aiton. Our fpecimen is from Aublet. The fhape of the *leaves*, as above defined, is very different from any of the foregoing, with much more diftant, lefs parallel, veins; in which refpect Plumier's plate is altogether unlike our plant. Our *flower-ftalks* too are much more elongated, zig-zag, and copioufly jointed. Aublet fays it is as large as a pear-tree of the largeft fize. Burmann has very improperly confounded the fynonyms of *P. rubra* with this, and Willdenow, like Linnæus, erroneoufly cites under it Rumphius's *Flos convolutus*; fee n. 2.

5. P. *pudica*. Virgin Plumeria. Jacq. Amer. 37. Willd. n. 4.—Leaves oblong, flat. Limb of the corolla clofed.—Jacquin fays he faw this plant cultivated in the gardens of Curaçao, where it was highly efteemed for its *flowers*, known there by the name of Douzellas, or virgins, becaufe they are never expanded. Their colour is entirely yellow, and their fcent, in the opinion of the author we quote, greatly excels every other *Plumeria*, and feemed fuperior to all the flowers with which he was acquainted. The *fhrub* is five feet high, milky, with umbrageous, oblong, flat veiny *leaves*. *Flowers* lafting, in abundant fucceffion, for two months,

months, their *corolla* always rolled up, like the *Achania Malvavifcus*.

6. P. *cuneata*. Wedge-leaved Plumeria. Linn. fil. MSS. (P. alba; Aubl. Guian. v. 1. 259, excluding the fynonyms.)—Leaves obovate, fomewhat wedge-fhaped, rounded, pointlefs; veins diftant.—Cultivated at Cayenne, according to Aublet, who took it for the Linnæan *P. alba*. We have numerous *leaves* from his own herbarium, given by fir J. Banks to the younger Linnæus, who juftly remarked that this muft conftitute a diftinct fpecies, though he had feen merely thefe feparate *leaves*. Another fpecimen, apparently from the fame herbarium, and likewife without *flowers*, is marked *P. laurifolia;* but it looks to us like a lefs blunt variety of Aublet's *obtufa*.

The French name of this genus, *Frangipanier*, is rather remarkable. It is faid to allude to its fragrance, *Frangipani* being a fort of perfume, fo called in France from its inventor, an Italian, of the Frangipani family, fo confpicuous in the Roman difturbances of the twelfth century.

Plumeria, in *Gardening*, contains plants of the fucculent, flowering, exotic kind for the ftove, of which the fpecies cultivated are the red plumeria, or jafmine (P. rubra); the white plumeria (P. alba); the blunt-leaved plumeria (P. obtufa); and the clofe-flowered plumeria (P. pudica.)

Method of Culture—Thefe plants are capable of being increafed by feeds and cuttings of the young branches. The feeds fhould be procured from the native fituation of the plants, and be fown in pots, filled with a light fandy compoft, plunging them in a hot-bed, covered by glaffes, or the bark-bed in the ftove, when they readily vegetate; and when the plants have attained a few inches in growth, they fhould be removed into feparate pots, of a fmall fize, which muft be plunged in beds of the fame kind as above.

The cuttings fhould be made from the young branches, and after being laid in the ftove or fome other dry fituation, to difpel their fucculence, and heal over the wounds, be planted out during the fummer months, in pots, filled with light dry mould, plunging them in the bark bed of the ftove, giving occafional fhade and very flight waterings, till they have ftricken frefh root, and when they have become well rooted, they may be removed into feparate pots, being managed as other ftove exotics.

They afford much ornament and variety among collections of ftove plants; efpecially the red fort; and when fet out with other potted plants in the fummer, have a delightful fragrance.

PLUMIER, Charles, in *Biography*, a French botanift and ecclefiaftic, of the moft refpectable character, was born in 1646. He belonged to the religious order of Minims, and is defcribed as of a fimplicity of character becoming his monaftic profeffion, if not invariably affociated with it. To this he added the moft enthufiaftic love of botany, and a degree of accuracy and penetration rarely excelled in that fcience. He was fent, at the expence of the French king, on three different voyages to the Weft Indies; and was about to undertake a fourth, when he died of a pleurify at Cadiz in 1704, aged 58.

His firft publication is entitled *Defcription des Plantes de l'Amerique, avec leurs figures*, a fplendid folio of above 100 pages, with 108 plates, which iffued from the Louvre prefs, at the king's expence, in 1693. The text is French; the plates are outlines, drawn by Plumier himfelf, with a mafterly hand. In the preface he relates, that he firft imbibed a tafte for botany at his convent of Trinitâ dei monti at Rome, from the lectures of Father Sergeant, a French monk, and of de Onuphriis, a Roman phyfician. By this tafte he was infenfibly diverted from the mathematics, which have always been much ftudied in that convent, even to our own times. Being ordered to his native country, he obtained the permiffion of his fuperiors to botanize on the fhores of Provence, and the mountains of the Alps. Here he meditated a general *Pinax*, or Syftem of Botany, with figures, of which he had actually drawn a confiderable number, when he found at Marfeilles an opportunity of failing to America. Begon, intendant of the French navy, furthered his views, and procured for him the patronage and fupport of government; by which action alone, if by nothing elfe, the intendant may be faid to have merited his own botanical honours. (See Begonia.) Of the plates of this book, 50 are devoted to the fern tribe, and contain many curious fpecies, previoufly unknown to botanifts. The reft of the engravings confift of many fpecies of *Piper*, *Arum*, and *Paffiflora*, with other climbing plants. Their parts of fructification are not critically detailed; but that defect was fupplied in the author's *Nova Plantarum Americanarum Genera*, a thin quarto, publifhed in 1703, after his third voyage. In this book 106 new genera are eftablifhed, and illuftrated with plates. The manner and principles of Tournefort are adopted throughout. In his nomenclature, Plumier is profufe in honouring botanifts, as well as in adopting the moft uncouth words of barbarous origin; fcarcely conftructing one original name, of Greek or Latin derivation, except perhaps *Saururus*, a genus now funk in the more ancient *Piper*. Haller juftly complains, that Plumier falls into the imperfections of Tournefort, with refpect to his fuperficial mode of confidering the parts of the flower, and his inattention to number in their defcription. He hints alfo that fome of the delineations have a doubtful or fufpicious afpect. That fome of thefe figures are erroneous in parts, cannot be denied; as the ftamens of *Fuchfia*, the ftigmas of *Plukenetia*, and the whole flower of *Matthiola;* befides abundance of flight negligences or inaccuracies; but we muft not try the performances of one of the fathers of fcientific botany, by the teft of our prefent advanced knowledge.

The Ferns of Plumier's firft publication were reprinted with a great number of additional figures of the fame tribe, very finely executed, in another fplendid folio, containing 172 plates, with Latin as well as French defcriptions. In the preface he inveftigates all that had been faid relative to the flowers of thefe plants; and though he attributes to Tournefort a fentiment of Pliny's, he proves himfelf fufficiently converfant with botanical writers. To give the more confequence to his favourite purfuit, he very commendably enlarges on the benefits which medicine may derive from the ftudy of the vegetable world: but as Rouffeau's Swifs herbalift died of a pleurify, whilft employed in gathering a fovereign Alpine remedy for that diforder; fo it is not improbable that Plumier was extolling the *Polytrichum*, fee his preface p. 2, as "un antipleuritique des plus affurez," when he himfelf fell a victim to the very fame diftemper; leaving his half-printed book to be his monument. So much eafier is it for an ardent botanift to catch a pleurify, we write from the conviction of experience, than to cure one!

The above works contained but a fmall part of the productions of Plumier's pencil. Vaft treafures of his drawings, in outline, have remained in the French libraries, for the moft part unpublifhed. The late earl of Bute obtained copies of a great number of thefe, which after his lordfhip's death paffed into the hands of fir Jofeph Banks. Boerhaave had previoufly procured copies of above 500, done by the accurate Aubriet, under Vaillant's infpection, which were afterwards, in great part at leaft, publifhed by John Burmann at Amſterdam, between the years 1755 and 1760. Theſe plates are executed with tolerable, but by no means infallible, accuracy, being far inferior in neatneſs and correctneſs to what Plumier himſelf publiſhed. The well-meaning editor has overloaded the book with deſcriptions of his own, neceſſarily made from the figures, and therefore entirely ſuperfluous. They are indeed not unfrequently founded in miſapprehenſion; nor has he been very happy in the adaptation of his materials to Linnæan names and principles. He ought rather, as Lamarck obſerves, to have given Plumier's materials without alteration or addition. A careful reader may, nevertheleſs, avoid being miſled; as the original names and definitions of the author are ſubjoined. It is a pity that nothing is preſerved of the native country, hiſtory, properties or colours of each plant.

Father Plumier wrote, in the *Journal des Sçavans* for 1694, and elſewhere, on Cochineal, and ſome ſubjects connected therewith; proving that valuable article of commerce to be an animal, and not any thing of a vegetable nature. His opinion was, in every eſſential point, confirmed, as well as more preciſely illuſtrated and eſtabliſhed, by Richter, in his rare little treatiſe *de Cochinilla*, publiſhed at Leipſic in 1701.

Our author left no herbarium of his own, his collection of dried plants having been loſt at ſea; but he had, on various occaſions, communicated dried ſpecimens to Tournefort; and theſe ſtill remain, with his hand-writing annexed, in the collections at Paris. Liſter, who viſited Plumier in his cell at the convent of Minims in that city, ſpeaks of his obliging and communicative manners, and of his "deſigns and paintings of plants, birds, fiſhes, and inſects of the Weſt Indies, all done by himſelf very accurately." It appears that, notwithſtanding the royal favour, he was obliged to ſolicit repeatedly, and moſtly in vain, for the publication of his drawings at the king's printing-preſs; ſo imperfect is government patronage for ſcience on all occaſions, and in all countries! See Liſter's Journey to Paris. Plumier's Works. Haller Bibl. Bot.

PLUMMER's Ethiops. This medicine is compoſed of the ſulphur auratum antimonii and calomel, commonly in equal parts, *e. gr.* of each three drams; but this may be varied occaſionally, according to the phyſician's diſcretion. Theſe two powders muſt be well levigated together, by which the bright red colour of the ſulphur is changed into a duſky brown; afterwards, add two drams of the extract of liquorice; and the maſs, with a ſufficient quantity of the mucilage of gum arabic, may be made into pills. We refer to the Medical Eſſays of Edinburgh for the doſe, regimen to be obſerved, and effects of this medicine; as alſo for the manner of preparing the ſulphur of antimony according to Angelus Sala, which is ſaid to be preferable to the common method. See Med. Eſſ. Edinb. abridg. vol. i. p. 205. vol. ii. p. 455.

This medicine has been found greatly beneficial in cutaneous eruptions, and is ſaid to have completed a cure after ſalivation has failed, in venereal infections, and in gleets remaining after the cure of a gonorrhœa. It operates by carrying off the excrements of diſtempers by inſenſible perſpiration or ſweat. It has alſo been found ſucceſsful in obſtinate glandular ſwellings; two or three pills of an ordinary ſize may be taken night and morning, the patient keeping moderately warm, and drinking after each doſe a draught of the decoction of the woods, or of ſarſaparilla.

PLUMMET, *Plumb-rule*, or *Plumb-line*, an inſtrument uſed by maſons, carpenters, &c. to draw perpendiculars; in order to judge whether walls, &c. be upright, planes horizontal, and the like.

It is thus called from a piece of lead, *plumbum*, faſtened to the end of a thread or chord, which uſually conſtitutes this inſtrument.

Sometimes the ſtring deſcends along a ruler of wood or metal raiſed perpendicularly on another; in which caſe it becomes a level.

At ſea a plummet is uſed by the pilot to ſound the depth of the water.

PLUMOSE Antennæ, in *Natural Hiſtory*, a term uſed to expreſs the antennæ, or horns of certain moths and butterflies, which are formed in the manner of feathers, being compoſed of a ſtem and fibres iſſuing on each ſide from it: theſe are jointed and moveable any way; and even the ſmall fibres, at their ſides, are jointed at their bottom, and are moveable, but they move all together. See Feelers.

PLUMSTEAD, in *Geography*, a poſt-town of Pennſylvania, ſituated on the weſt ſide of Delaware river; 36 miles N. of Philadelphia.

PLUMULA, in *Botany* and *Vegetable Phyſiology*, ſo called from its reſemblance to a little feather, is the expanding embryo of a ſeed juſt ſprouting, which ſoon becomes a tuft of young leaves, elevated by the protruding ſtem. See Embryo and Cotyledones.

PLUNDER, in *Sea Language*, a name given to the effects of the officers or crew of a prize, which are pillaged by the captors.

PLUNGE, in the *Manege*. See Estrapade.

PLUNGER, in *Mechanics*, a ſolid braſs cylinder uſed as a forcer in forcing pumps.

Plunger is alſo a large veſſel, intended to act as a counter-poiſe for raiſing the water in a lock, in ſome of the ſchemes for ſaving water. See Canal.

PLUNOS, in *Ancient Geography*, a port of Lybia, at the extremity of the country of the Adymachides; mentioned by Lycophron and Herodotus.

PLUQUET, Francis Andrew, in *Biography*, a French abbé of ſome celebrity in the 18th century, was born at Bayeux, in Normandy, in 1716. He was educated for the church, and obtained ſome preferment in it: after this, he was nominated to fill the chair of profeſſor of hiſtory in the univerſity of Paris. By his lectures he acquired a conſiderable ſhare of reputation, the claim to which he ably ſupported by ſeveral uſeful and well-written works. He died in 1790, at the age of 74, having maintained through life the character of a truly virtuous good man. His principal publications are, "An Examination of the Doctrine of Fataliſm," in 3 vols. 12mo.; "A Dictionary of Hereſies," in 2 vols. 8vo.; "A Treatiſe on Sociability," in oppoſition to the ſyſtem of Hobbes, and to prove that man is diſpoſed to benevolence and religion; "The Claſſical Books of the Chineſe Empire," in 4 vols. 12mo., tranſlated from the collection of father Noel; and "A philoſophical and political Treatiſe on Luxury," in 2 vols. 12mo.

PLURAL, Pluralis, in *Grammar*, a particular inflexion of nouns and verbs, whereby they come to expreſs a plurality or number of things.

The Latins, Engliſh, &c. have only two numbers, *ſingular* and *plural;* the Greeks and Hebrews have three, *ſingular*, *dual*, and *plural*.

In Latin, &c. both nouns and verbs have uſually diſtinct terminations to their different numbers; in Engliſh, nouns ſubſtantives uſually become plural by the addition of an *s* or *es* to the ſingular.

Nouns adjective are the ſame in both numbers; and in verbs, the number is diſtinguiſhed by that of the pronouns.

PLURALITY, Pluralitas, a diſcrete quantity, conſiſting of two, or a greater number.

A *plurality*

A *plurality of worlds* is a thing which Mr. Huygens has endeavoured to prove in his Cosmotheoros. And the same is likewise contended for in a very pretty treatise of M. Fontenelle under that title.

See the chief argument for a plurality of worlds under MOON, PLANET, and EARTH.

The greatest absurdity in the pagan theology is the *plurality of gods*.

PLURALITY *of Benefices*, or *Livings*, is where the same clerk is possessed of two or more spiritual preferments, with cure of souls. See BENEFICE.

Plurality of benefices is a thing too much tolerated in the church, but never approved of.

It was the smallness of some benefices that first gave occasion to pluralities; for an ecclesiastic, not being able to subsist on a single one, was allowed to hold two; and at length the number increased without bounds.

The abuse was endeavoured to be remedied at the council of Lateran, under Alexander III. and Innocent III., in the year 1215, when the holding more than one benefice was expressly forbid by a canon, under the penalty of deprivation: but the same canon granting the pope a power to dispense with it in favour of persons of distinguished merit, there were so many found a title to this merit, that the prohibition became useless.

Pluralities were also restrained by statute 21 Hen. VIII. cap. 13, which enacts, that if any person, having one benefice with cure of souls, of the yearly value of 8*l.* or above, (in the king's books,) accept any other with cure of souls, the first benefice shall be adjudged in law to be void, &c., though the same statute provides for dispensation in certain cases. For other provisions of a later date, see CHAPLAIN and CURATE.

In order to procure a dispensation, the presentee must obtain of the bishop, in whose diocese the livings are, two certificates of the values in the king's books, and the reputed values and distance of such livings; one certificate for the archbishop, and the other for the lord chancellor. And if the livings lie in two dioceses, then two certificates, of the same kind, are to be obtained from each bishop. He must also exhibit to the archbishop his presentation to the second living; and bring with him two papers of testimonials from the neighbouring clergy, concerning his behaviour and conversation, one for the archbishop, and the other for the lord chancellor; and he must also exhibit to the archbishop his letters of orders of deacon and priest, and a certificate of his having taken the degree of master of arts at the least, in one of the universities of this realm, under the hand of the register of such university. And in case he be no doctor or bachelor of divinity, nor doctor of law, nor bachelor of canon law, he is to procure a qualification of a chaplain, which is to be duly registered in the faculty office, in order to be tendered to the archbishop, according to the statute. And if he hath taken any of the aforesaid degrees, which the statute allows as qualifications, he is to procure a certificate thereof as already mentioned, and to exhibit the same to the archbishop; after which his dispensation is made out at the faculty office, where he gives security according to the direction of the canon. Afterwards he must repair to the lord chancellor, for confirmation under the broad seal; and then he is to apply to the bishop of the diocese where the living lies, for his admission and institution. By 48 Geo. III. c. 149, for every skin, or paper, or parchment, &c. on which any dispensation to hold two ecclesiastical dignities or benefices, or a dignity and a benefice, shall be engrossed or written, there shall be paid a stamp duty of 30*l.*, when either of them shall be above the yearly value of 10*l.* in the king's books; and in all other cases 20*l.*

We have also a regulation in regard to pluralities; but it is often dispensed with; for, by the faculty of dispensation, a pluralist is required, in that benefice from which he shall happen to be most absent, to preach thirteen sermons every year, and to exercise hospitality for two months yearly.

In Germany the pope grants dispensations for possessing a plurality of benefices, on pretence that the ecclesiastical princes there need large revenues to bear up against the Protestant princes.

PLURIES, in *Law*, a writ that issues in the third place after two former writs have been disobeyed: for first goes out the original writ or *capias*, which, if it has no effect, then issues the *alias;* and if that also fails, then the *pluries*. Old. Nat. Br. 33.

It is used in proceedings to outlawry, and in great diversity of cases. Tabl. Reg. Writs.

PLURS, in *Geography*. See PLEURS.

PLUS, in *Algebra*, a term commonly used for *majus*, or *magis, more;* denoted by the character +.

Thus $4 + 10 = 14$, is read, four, *plus*, or more, 10, is equal to 14.

PLUSH, in *Commerce*, &c., a kind of stuff having a sort of velvet nap or shag on one side; composed regularly of a woof of a single woollen thread, and a double warp, the one wool, of two threads twisted, the other goats' or camels' hair; though there are also some plushes entirely worsted, and others composed wholly of hair.

Plush is manufactured, like velvet, on a loom with three treadles. Two of these separate and depress the woollen-warp, and the third raises the hair-warp, upon which the workman throwing the shuttle, passes the woof between the woollen and hair-warp; and afterwards laying a brass broach, or needle, under that of the hair, he cuts it thereon with a knife destined for that use, conducting the knife on the broach, which is made a little hollow, all its length; and thus gives the surface of the plush an appearance of velvet.

Some ascribe the invention of plush to the English; others say it was first made in Holland, and particularly at Haerlem. Be this as it will, it is certain the French are the people who make the most of it; there being several very considerable plush manufactures at Amiens, Abbeville, and Compeigne.

There are other kinds of plush, all of silk; some of which have a pretty long knap on one side, and some on both.

PLUSH, among *Botanists*, is a name given to the middle of roses, anemonies, &c., called also *thrum* or *thrummy heads;* by others, *hairy heads*, *buttons*, *bass*, *tuft*, or *wort*.

This is properly the *stamina* of the flower.

PLUTARCH, in *Biography*, an eminent biographer, was born at Chæronea in Bœotia, of a family that had long filled the offices of magistracy in that city. The time of his birth is not exactly ascertained, but it was probably about the commencement of the reign of Nero. He studied under a philosopher of the name of Ammonius, whose particular sect is not known. After he had completed the usual course of academical education, he travelled for improvement; and it is said that he visited Egypt: there is, however, no other evidence of this fact than that he wrote a treatise on Isis and Osiris. His attachment to study did not prevent him from engaging in public business. While he was a very young man, he went on a deputation to the Roman proconsul; and it was probably in some public capacity that he first visited Rome, and other parts of Italy; for

for he fays, he had not leifure at that time to learn the Latin language, on account of the number of commiffions with which he was charged, and the numbers who reforted to him in order to be inftructed in philofophy. He either revifited Rome, or made it his continued abode for a confiderable time, fince we find him in reputation there during the reign of Trajan, who is fuppofed to have been one of his auditors. That fame emperor is faid to have raifed Plutarch to the confular dignity: this, however, was probably only a titular honour. He finally retired to his native place, in which he fixed his refidence, giving this as a reafon, that being born in a little city, he would not make it lefs by deferting it. Here he was chofen to the office of archon, or chief magiftrate, and was afterwards admitted into the college of priefts of the Delphic Apollo. He is thought to have died about the year 120. He was married, and had feveral children. Two fons furvived him, *viz.* Plutarch and Lamprias; the latter probably imitated his father in his ftudies, as he drew up a catalogue of his works, and is fuppofed to have collected his apophthegms. He had a nephew, Sextus, who was preceptor in the Greek language to the emperor Marcus Antoninus. The name of Plutarch is popularly known by his "Lives" of illuftrious men, one of the moft interefting remains of ancient literature, and to which, in our biographical articles, we have had frequent recourfe. A vein of pure morality runs through them, with a fpirit of piety, occafionally deviating into fuperftition. From the lift of his writings it appears that feveral of his biographies are loft. Plutarch's moral treatifes are numerous and valuable; the author does not excel in depth and fagacity, but his fentiments are commonly marked with good fenfe and candour. In kindnefs of heart and humanity few philofophers have furpaffed him. It appears from his fon's catalogue, that more of his works of the moral and critical clafs have been loft than preferved. Of the complete works of Plutarch, the beft editions are thofe of Maufac and of Reifke. There are numerous editions of the Lives, and other detached works, tranflated into various languages. In our own language we have a great number of different editions.

Though no dictionaries or biographical accounts in our country, or in France, feem to have taken notice of his knowledge and love of mufic, or of his writings on the fubject, M. Burette, in the 8th vol. 4to., and 11th abridg. of the Memoirs of the Acad. des Infcriptions et Belles Lettres, in 1726, took up the fubject of ancient Greek mufic, and, with a true critical fpirit, laid open all its arcana, after a long ftudy of modern mufic, and the Greek writers who have treated of it *ex profeffo*, or incidentally; letting us know nearly all that is to be known with certainty of this myfterious fubject.

After denying to the ancients, in the moft formal terms, the knowledge of counterpoint, he proceeds to the examination of Plutarch's "Dialogue on Mufic," firft removing all doubt of its having been written by him, which had been difputed, and then proceeds to a clofe, and, in general, faithful tranflation, which he gives oppofite to the original text; and proves from that work itfelf, that the ancients were perfectly ignorant of compofition, or mufic in parts. And what gives greater force to this proof is, that Plutarch was thoroughly verfed in the fubject which he treats. He writes of the nature of found, fo far as was then known; of its generation and proportions; of the genera, intervals, modes, rhythm, melopœia; explains the mufical technica of the Greeks, (not the notation,) but neither quotes nor mentions any practical mufician, except Ariftoxenus. Of poet muficians, from Homer to the time of Alexander the Great, he makes honourable mention, but of none after.

He fpeaks frequently of mufic having been corrupted by the theatre, particularly in his "Dialogue," where he fays, "If we look back into remote antiquity, we fhall find that the Greeks were unacquainted with theatrical mufic. The only ufe they made of this art was in praifing the gods, and educating youth. The idea of a theatre had not then entered their thoughts, and all their mufic was dedicated to facrifices, and to other religious ceremonies, in which they fung hymns in honour of the gods, and canticles in praife of great and good men."

It fhould be remembered here, that Plutarch was a prieft of Apollo; and, moreover, that what he, Plato, and Ariftoxenus fay, concerning the injuries which mufic had received from the theatre, favours very much of cant and prejudice. Athenæus, on the contrary, tells us, that notwithftanding the complaints of Ariftoxenus againft theatrical corruption, others were of opinion, that mufic derived its principal improvements in Greece from the theatre; and it feems natural, that the hope of applaufe, and the fear of cenfure, fhould operate more powerfully on the induftry and faculties of a compofer or performer, than the idea of private praife or blame. And, if we may judge of ancient times by the prefent, the theatre feems the place to develope all the powers of mufic, and to expand the talents of its profeffors: for it is at the mufical theatre, the modern temple of Apollo and the mufes, that perfection of various kinds is more frequently found than any where elfe. But old things do get violently praifed, particularly mufic, after it ceafes to give pleafure, or even to be heard; and old people exclufively praife what pleafed them in their youth, without making allowance for their own want of judgment and experience at that time, which, perhaps, joined to the difpofition of youth to be eafily pleafed, occafioned their former delight.

It is natural to fuppofe as Greek mufic, like other arts, and other things, muft have had its infancy, maturity, and decrepitude; that in fecond childhood, as its effects were more feeble, its purfuits would be more trivial than before its decline. Few great actions were achieved by the Greeks after their total fubjection. However, they cultivated mufic under the Roman emperors, under their own, and are ftill delighted with it under the Turkifh government; but their mufic is now fo far from being the ftandard of excellence to the reft of the world, that none but themfelves are pleafed with it.

Plutarch treats the fubject of mufic in a manner lefs dogmatical than hiftorical. The two principal branches of the art, upon which he lays the moft ftrefs, are the harmonical and rhythmical; that is, *tone*, or melody, and *time*.

In M. Burette's notes, he gives a biographical account of all the ancient poets and muficians mentioned in the courfe of the Dialogue; which faves his readers much trouble in feeking them, difperfed as they are through all literature; and greatly enlivens the tranflation of many parts of the treatife, that are now either unintelligible or ufelefs.

Upon the whole, however, there is more to be learned from this Dialogue, concerning the hiftory, and indeed practice, of ancient mufic, thus illuftrated and explained, than in Meibomius, Ptolemy, and all the philofophers and mathematicians, who only treat of the monochord, ratios, and harmonics, without giving us a fingle paffage of ancient mufic, or telling us what it was in practice.

PLUTEI, in the Roman *Art of War*, were engines contrived for the defence of foldiers, confifting of the fame materials

materials with the vineæ, but of a different figure; being ſhaped like an arched ſort of waggon, and having three wheels, ſo conveniently placed, that the machines would move either way with equal eaſe.

PLUTO, in *Mythology*, the ſon of Saturn and Rhea, and ſovereign of the empire of darkneſs. Statius calls him the black Jupiter; and he is repreſented by the poets as ſeated on a throne, holding his ſceptre in his hand, which had two points by way of diſtinguiſhing it from Neptune's trident, which had three, with a veil over his head, which, as well as his complexion, ſhould be dark and terrible. He is ſometimes called by the name of Dis.

The fable of Pluto's having had hell or the empire of darkneſs aſſigned him for his lot is thus explained by Diodorus Siculus. He ſays, that it aroſe from his being the firſt who founded the cuſtom of burying the dead, of transferring them into ſepulchres, and of beſtowing other ſervices upon them, which before him had been neglected. But Banier, not thinking it probable that duties ſo natural would have been neglected till the time of Pluto, is of opinion, that he was reckoned the king of hell, becauſe he lived in a very lone country in reſpect of Greece, where Jupiter had fixed his empire. This country was the extremity of Spain, where he buſily employed himſelf in working at the gold and ſilver mines, which were very common near Cadiz, where he fixed his reſidence. Spain was anciently reckoned a country abounding with rich mines; and near Tarteſus, at the mouth of the river Betis, it is ſaid there was a mountain of ſilver: and from this name of the iſland Tarteſus, Tartarus is ſuppoſed to have been derived. This circumſtance induced Pluto to fix his reſidence in this iſland, and hence he obtained the name of Pluto, the god of riches, and has been ſometimes confounded with Plutus. Beſides, Pluto's kingdom was not only low in reſpect of ſituation compared with Greece, but as Pluto employed labourers in the mines, who dug into the bowels of the earth, and penetrated, as it were, to the gloomy manſions of the manes, ᾅδης, or hell, in ſearch of hidden treaſures, he was reckoned king of the dead. Beſides, the ocean, on the coaſt of which he reigned, was accounted a place overſpread with darkneſs, and this, as Banier imagines, was the foundation of all the fables that were invented concerning Pluto and his realms of darkneſs. Tartarus he ſuppoſes to have been derived from Tarteſus near Cadiz, and the river Lethe from Guadelethe, which runs over-againſt that city, and the lake Avernus from the word Abarona, importing *at the extremities*, a name given to that lake, which is near the ocean; accordingly Pluto was particularly worſhipped at Cadiz, under the name of Death, as Philoſtratus has obſerved; of which there can be no doubt, ſince the Phœnicians, whoſe language was eſtabliſhed at Cadiz with the colonies planted there by Hercules, called Pluto *Muth*, their name for Death. We might alſo add, that all the names given to him, or the countries where he was worſhipped, have a relation to this title, "god of the dead." For the rape of Proſerpine by Pluto, ſee PROSERPINE.

PLUTUS, the god of riches, reckoned amongſt the number of infernal deities, becauſe riches are derived from the bowels of the earth. Heſiod makes him to be a deſcendant of the Ceres and Jaſion in the iſle of Crete, probably becauſe theſe two perſons applied themſelves to agriculture, which is the means of obtaining the moſt ſubſtantial riches. Plutus had a ſtatue at Athens, placed in the temple of Minerva, where the public treaſures were depoſited; at Thebes, in the temple of Fortune, this goddeſs holds Plutus in her arms as an infant, nouriſhed by her; and at Athens, Plutus is in the arms of the ſtatue of Peace, as the ſymbol of riches, which give peace.

This Plutus, having been obſerved to diſpenſe his favours very unequally, was therefore repreſented as blind: and Ariſtophanes in his "Plutus" adds, that he was lame, becauſe whenever he had a mind to enrich the good, he came to them very ſlowly; and when it was his intention to favour them, he was very clear-ſighted, and ſaid to have good eyes. Pindar, Ariſtophanes, and Lucian inform us, that Plutus was a daſtardly god, on which circumſtance Eraſmus has founded one of his proverbs; but Plutus vindicates himſelf from that imputation, in the comedy above cited, and ſays, that as thieves and robbers never could catch him, that is, never could acquire great riches, they hence conſtructed his precaution and foreſight to be cowardice. St. Jerom, followed by ſeveral eccleſiaſtical writers, alleges that the Syriac or Chaldaic word "Mammona" was the ſame with the Plutus of the Greeks.

PLUVIAL, PLUVIALE, anciently ſignified a hood or cloak; which eccleſiaſtics, chiefly religious, wore in the country, to ſhelter themſelves from the rain; by the Latins called *pluvialis lacerna*.

The word is now uſed, in the Romiſh church, for a large hood worn by the chanter and ſubdeacon at maſs and veſpers, &c. It covers the whole man, and is fixed before with two claſps.

PLUVIALIS, in *Ornithology*. See PLOVER.

PLUVIALIS *Major*, a name given by ſome authors to the limoſa, a bird in ſome reſpects reſembling our red ſhank, but larger and longer legged.

This bird is alſo called the *glottis*. See SCOLOPAX *Glottis*.

PLUVIALIS *Levis*, a name given by many to the common green wood-pecker, the *picus viridis* of authors, called alſo in Engliſh the *rain-fowl*, from an obſervation of its always being moſt clamorous when rain is coming on. See PICUS *Viridis*. See alſo CUCULUS *Pluvialis*.

PLUVIGNER, in *Geography*, a town of France, in the department of the Morbihan, and chief place of a canton, in the diſtrict of L'Orient; 14 miles E. of L'Orient. The place contains 4800, and the canton 12,476 inhabitants, on a territory of $252\frac{1}{2}$ kiliometres, in ſeven communes.

PLUVIUS, in *Antiquity*, an attribute of Jupiter; implying him the author of rain; *q. d.* he that ſends rain. Among the baſſo relievos of the Antonine column, in the place where the miracle of the thundering legion is repreſented, we ſee a flying man in the air, his arms ſpread out, and with a very long beard, which ſeems to diſſolve into rain. The learned take this to be a repreſentation of Jupiter Pluvius. The Athenians worſhipped him under this name, as we learn from Pauſanias in Attic.

PLYERS, in *Fortification*, denote a kind of balance uſed in raiſing or letting down a draw-bridge. They conſiſt of two timber levers, about twice the length of the bridge they lift, joined together by other timbers framed in the form of a St. Andrew's croſs, which ſerves as a counterpoiſe. They are ſupported by two upright jambs, on which they ſwing; and the bridge is raiſed or let down by means of chains joining the ends of the plyers and bridge.

PLYING, or PLYING *to Windward*, in *Seamanſhip*, the act of making, or endeavouring to make, a progreſs againſt the direction of the wind. Hence, a ſhip that advances well in her courſe in this manner of ſailing, is ſaid to ply well, or be a good plyer. See BEATING, in *Navigation*.

Plying is alſo uſed by ferrymen to denote their waiting for a fare.

PLYMOUTH, in *Geography*, a town having ſeparate juriſdiction, in the hundred of Roborough, at the weſtern extremity of Devonſhire, is 218 miles W.S.W. from London. It is ſituated at the head of a capacious haven, formed by the conflux of the rivers Tamar and Plym with the ſea, and is probably the largeſt corporate town in the county, as well as one of the moſt important maritime places in England. Within a circuit of two miles, including its appendages of Stonehouſe and Dock, there is a population of between 60,000 and 70,000 people, excluſive of ſeamen and ſoldiers. Plymouth is of conſiderable antiquity, and was called, in the time of the Saxons, Tameorwerth: after the Conqueſt it acquired the name of South-Town, or Sutton; and in the reign of Edward I. of Sutton-Prior, and Sutton-Valletort, the north part of the town being ſituated on the lands of the prior of Plympton, and the ſouth part on the eſtate of the Valletorts. Theſe names were relinquiſhed in the reign of Henry VI., for the more appropriate appellation of Plym-mouth. In the reign of Edward III. the increaſing conſequence of the town rendered it an object of jealouſy to the French, who landed here, and endeavoured to deſtroy it by fire; but were repulſed, with the loſs of 500 men, by Hugh Courtenay, earl of Devonſhire, under whoſe command the ſurrounding gentry and their vaſſals had aſſociated with much celerity. In the ſixth year of Henry IV. the French were more ſucceſsful, when they landed near that part now called Briton-ſide, and burnt upwards of 600 houſes; but failing in their attempts againſt the caſtle and higher part of the town, they retired to their ſhips, and proceeded to Dartmouth, where their commander, De Caſtell, and ſeveral hundred men, were made priſoners. From this time till the reign of Henry VI., the town dwindled into a mere fiſhing village; when it was rebuilt and improved by the prior of Plympton, who, by granting certain privileges, occaſioned a conſiderable increaſe of inhabitants, and effected the revival of trade and enterprize. In the 18th year of Henry VI. it was incorporated as a borough, and on the diſſolution of monaſteries, in the reign of Henry VIII., the entire lordſhip of the borough, together with the patronage of the religious eſtabliſhments within or near the town, were given to the mayor and commonalty, and theſe advantages they ſtill retain. In the reign of queen Elizabeth, through the means of ſir Francis Drake, various privileges were granted to the town, and at the private expence of the ſame gallant admiral, a ſtream of water was conveyed to it from ſome ſprings on Dartmoor, by a winding channel of twenty-four miles in length. In the year 1579, Plymouth was viſited by a dreadful plague, ſuppoſed to have been introduced with ſome cotton-wool, landed from a Smyrna ſhip, without firſt being properly aired. Upwards of 600 perſons fell victims to its ravages; and ſo general was the fear of its ſpreading, that the annual election for mayor was held in the open air, on Cat-down, ſome diſtance from the town. In 1581 the plague again broke out, and continued ſeveral months; and many of the inhabitants became victims to its violence. At the period of the expected invaſion by the Spaniſh Armada, in 1588, a Britiſh fleet of 120 ſail was aſſembled in Plymouth Sound, under the command of lord Howard, and the admirals ſir Francis Drake and ſir John Hawkins. This fleet ſailed for Torbay to join the Exeter ſhips; and ſoon afterwards the grand Spaniſh armada, which papal arrogance had pronounced invincible, appeared in the form of a creſcent, and *lay to* off the harbour of Plymouth; but proceeding to the eaſtward, it was aſſailed by the Britiſh fleet, and a deſtruction thus commenced was completed by a violent ſtorm, which utterly fruſtrated the expedition. In 1595, the landing of the Spaniards in Cornwall, (for which ſee PENZANCE,) threw the inhabitants of Plymouth into much alarm, and cauſed the adoption of various precautions to enſure their ſafety. From this period till 1625, nothing material occurred, when Charles I. with his whole court, 120 ſhips, and 6000 troops, came from Portſmouth, and remained here ten days, ſumptuouſly entertained by the mayor and corporation. In the following year, Plymouth was a third time infeſted by a plague, which raged with incredible fury, till nearly 2000 perſons were deſtroyed. About 1637, in conſequence of a petition to that effect from the mayor aud commonalty, the town was divided into two pariſhes, and in 1640, an act was obtained for the erection of a new church; but the civil wars, which ſoon after enſued, occaſioned the ſuſpenſion of this latter deſign. At the breaking out of the civil war, Plymouth very early declared in favour of the parliament, and the year 1643 forms a memorable era in the annals of its hiſtory, from the ſpirited reſiſtance made by the inhabitants againſt the forces of prince Maurice, who beſieged it from September till the cloſe of the year without ſucceſs. What the citizens wanted in means of defence, was made up to them in enthuſiaſm, and they held out till the parliamentary forces, under the earl of Eſſex, approached to their relief. On the ſurrounding eminences are ſtill to be traced the remains of various works, conſtructed both for the defence and reduction of the town. The different attempts of the royaliſts, under the king in perſon, and his general, ſir Richard Grenville, ſucceſſively proved abortive, and they were finally compelled to raiſe the ſiege, and entirely withdraw their forces. In the year 1683 the charter of the town was ſurrendered to the king, on the requiſition of judge Jefferies, and a new one granted at an expence of 417*l.* 19*s.* This veſted the power in ten aldermen and twelve aſſiſtants only, and continued in force till the latter end of the year 1697, when the old charter was reſtored, though not before upwards of 600*l.* had been ineffectually expended.

Various fortifications have been at different times erected for the ſecurity of Plymouth, and it is now in a ſtate of reſpectable and formidable defence. Several ſmaller block-houſes and forts were demoliſhed on the building of the citadel on their ſcite, in the time of Charles II., in 1670. This ſtrong fortreſs conſiſts of three regular, and two irregular baſtions; and the curtains of the regular baſtions are further ſtrengthened by two ravelins and horn-works. On the eaſt, north, and weſt ſides is a deep ditch, counterſcarp, and covered way, paliſadoed. In the time of war the parapets are mounted with a great number of heavy ordnance, and the garriſon conſiſts of a regiment of militia. A lieutenant-governor, and other officers, reſide here. The view from the ramparts is exceedingly beautiful, and comprehends a great variety of intereſting objects. There is a lower fort, connected with the citadel, and chiefly intended for the defence of the ſound. Beſides theſe works, ſeveral batteries and block-houſes are raiſed on different points of the harbour; on mount Batten, Staddon-heights, and at Maker; but its chief ſecurity is St. Nicholas iſle and its formidable batteries. This iſland riſes nearly in the centre of the ſound, between the Plymouth ſhore and mount Edgecumb. Between the latter and the iſland is a ridge of rocks, great part of which is viſible at low water, and renders the entrance into the ſound, or harbour, difficult and dangerous.

The Victualling office, under the eaſtern walls of the citadel, is an extenſive range of buildings, where the ovens for ſupplying the navy with bread, and the ingenuity exerciſed in the baking and preparations, preſent intereſting objects: though there are but two bakehouſes, each containing four ovens, yet they are heated eight times a day, and in the courſe of that time bake a ſufficient quantity of bread for 16,000 men. The granaries are large and well conſtructed; and the whole proceſs of converting the grain into bread is ſimple and ingenious.

The town itſelf has very few claims either to elegance or neatneſs; the ſtreets are in general ill conſtructed, irregular, and badly paved, but a better taſte characteriſes the improvements which are taking place. Amongſt the public buildings the moſt ancient is the pariſh church, which conſiſts of a nave, ſide aiſles, and chancels, with a tower at the weſt end, ornamented with pinnacles. This ſtructure contains ſeveral curious and ancient monuments. The preciſe period of its erection is not known, but it is mentioned in a general ſurvey in the year 1291. The tower is of more recent date, having been built, in 1440, by Thomas Yogge, a merchant of the town. The other church, begun in 1646, is conſecrated to the memory of Charles I., and called Charles's church. Sectariſts are numerous, and here are various meeting houſes, chapels, and a ſynagogue for Jews. The Guildhall, lately rebuilt on the ſcite of a more ancient one, is a very indifferent edifice. It contains a few portraits of ſome of the Engliſh ſovereigns and other illuſtrious perſonages. Adjoining the guildhall, and connected with it, are the public priſons of the town; they conſiſt of a room for debtors, and ſeveral cells for priſoners, all very ſmall and inconvenient. There are twenty-one charitable inſtitutions in Plymouth, ſome of them eſtabliſhed and ſupported by the town, others by voluntary contribution, and the reſt from the annual income of donations by individuals. Of the former are the workhouſe, which is a very uſeful and well regulated inſtitution; St. Andrew's alms-houſes, in which twelve widows are permitted to live gratis, with a ſmall weekly allowance; and the workhouſe alms-houſes, of a ſimilar nature with the laſt. Thoſe ſupported by voluntary contribution are the Public Diſpenſary, Houſehold of Faith, Female Aſylum, Grey and Yellow School, School of Induſtry, Public School, on the new plan of inſtruction deſigned by Dr. Bell and Mr. Lancaſter; Miſericordia, Lying-in-Charity, and Merchants' Hoſpital, for maimed and diſabled ſeamen, and the widows and orphans of ſuch as are killed, ſlain, or drowned in the merchants' ſervice. Thoſe maintained by private bequeſts are, Hele's charity, Lanyon's charity, Orphan's aid hoſpital and grammar-ſchool, Charles' almshouſes, Jory's alms-houſes, lady Rogers' ſchool, Kelway's truſt. The Preſbyterians have a very extenſive ſeminary for educating girls in the tenets of their ſect, ſupported by the contributions of their members. Among the other public buildings are to be noticed the public library, a new and elegant edifice erected by the ſubſcribers. It is capacious and convenient, and the architectural part executed with taſte and judgment by Mr. Feneſton; the front in imitation of a temple at Athens. The theatre and hotel, covering with their appendages nearly an acre of ground, have juſt been completed by the mayor and commonalty, at an expence of nearly 40,000*l.*; the front is very noble and has a portico, the largeſt in this country, containing eight columns of the Ionic order forty feet in elevation. The theatre is the handſomeſt country theatre in England, and is conſtructed almoſt entirely of iron. The roof is ſixty-four feet ſpan, and was made at Briſtol of wrought iron bars. There are three tiers of boxes formed of caſt-iron, the fronts thinly caſed with wood to preſerve the ſound. Plans for a new public exchange have been adopted, and are about to be acted upon, as well as are thoſe for a new pariſh church. Government has ſeveral military eſtabliſhments here, ſuch as barracks, hoſpitals, and priſons. The latter have lately been rebuilt, and are capable of containing 3000 men; they are placed under the direction of a captain of the navy, and uſed as a depot for priſoners of war, from whence they are ſent to Dartmoor and other inland priſons.

Plymouth was conſtituted a borough in the eighteenth year of Henry VI., and has ſent two members to parliament, without intermiſſion, ſince that period. It is governed by its own magiſtrates; who are a mayor, juſtice, and the two ſenior members of the bench of aldermen. In addition to the mayor and juſtice, the corporation conſiſts of twelve aldermen, twenty-four common-council men, a town clerk, and a coroner. A general ſeſſions of the peace is holden here four times in the year, where all offences, which extend to tranſportation for ſeven years, are tried, and thoſe of minor importance are determined by the mayor at his weekly ſitting in guildhall. There is a conſiderable trade carried on at Plymouth independently of the importation of coals, culm, corn, wine, timber, and articles for town conſumption, even during war, at which times a vaſt deal of buſineſs ariſes from the ſale of prizes and their cargoes, which attract purchaſers from all parts of the kingdom. During peace an active trade is carried on with Newfoundland. A new and convenient pier was erected in 1790, at the expence of government, which ſecures the veſſels lying in the pool, or inner harbour, from the violence of the waves. The market days are Mondays, Thurſdays, and Saturdays. The market-place has lately been erected at an expence of 10,000*l.*, and is very extenſive and commodious, comprehending three acres of ground, with an open area for a cattle market. The revenues belong to the corporation, and are conſiderable. Here are held two annual fairs.

The borough of Plymouth and its ſuburbs, according to the population report of 1811, contains 5732 houſes, and 56,060 inhabitants. Of theſe it is ſpecified that 12,339 were reſident within the pariſh of St. Andrew.

This town has not acquired much literary character. Joſeph Glanville, a celebrated divine and philoſopher, was born here in 1636. (For an account of his life and writings, ſee vol. xvi. art. GLANVILLE, JOSEPH.) The brave admiral ſir John Hawkins, who commanded the rear of the fleet which defeated the Spaniſh armada, was a native of this town (ſee vol. xvii.); and it was long the reſidence of the celebrated ſir Francis Drake, who was a member of the corporation, repreſentative to parliament, and the author of many valuable improvements in Plymouth, and its vicinity. (See vol. xii.) In the eaſt parts of the town are the remains of the priory of White friars, granted in the 38th year of Henry VIII. to Giles Iſelham. The principal gateway or entrance is in a very dilapidated ſtate, but the ruins of the priory itſelf are almoſt extinct, and their ſcite occupied by a ſmith's ſhop. The hoſpital of the Grey friars is ſtill remaining, and is now a private houſe. An abbey of Ciſtertian friars is ſtill ſtanding ſouth of St. Andrew's church, and is denominated the abbey wine vaults, the vaults being occupied for that purpoſe.

PLYMOUTH *Port and Harbour* is conveniently adapted for the purpoſes of trade, and affords an excellent road for ſhips of war, their prizes, and merchant veſſels. The harbour is divided into ſeveral ramifications, which are diſtinguiſhed by different appellations. Sutton-pool immediately adjoins the town, the buildings of which nearly encircle it. The entrance to the pool is between two large piers, erected by parliamentary grants in 1791—1799. It is ſurrounded with public and private quays, and all ſhips entering it are obliged to pay certain dues on landing their cargoes. The pool is under the ſuperintendance of a company, by whoſe management it has been benefited with important improvements.

Catwater harbour is formed by the eſtuary of the river Plym, and is capable of protecting from the ſouth-weſt gales, which are prevalent, upwards of 500 ſhips. Part of this harbour is under the juriſdiction of the mayor and commonalty of Plymouth, the other part is ſubject to the controul of the preſent lord Boringdon, who has been at much expence in laying down moorings, buoys, &c. On the banks of the Catwater are ſeveral ſmall villages. Cat-down, on the northern ſide, is famous for its lime-ſtone quarries: it has a ſhipwright's yard, various ſtore-houſes, wharfs, &c. for commercial tranſactions. Turnchapel, on the oppoſite bank, is the property of the Boringdon family, and is principally inhabited by ſhipwrights employed at the dock-yard here, where large ſhips of war are frequently repaired, and merchant and armed veſſels conſtructed. Oreſton is a populous village on the eaſtern banks, principally inhabited by ſea-faring men. In this neighbourhood are alſo the beautiful villages of Upper and Lower Hooe.

Proceeding from Catwater we enter into that part of the harbour denominated the *Sound*, which is a large and capacious bay peculiarly adapted for a naval rendezvous. One diſadvantage, however, attends it, of no inconſiderable kind, which is its expoſure to ſoutherly and ſouth-weſterly winds, that occaſion a tremendous ſwell. To obviate this objection, and render it ſafe as well as commodious, the lords of the admiralty determined to erect a pier or break-water, and applied to Mr. Rennie, a gentleman well fitted, from his extenſive architectural knowledge, to propoſe an efficient and practicable remedy, and render them a plan for the purpoſe. The report of this gentleman has been put in execution, and the work is in a ſtate of great forwardneſs. The plan of its conſtruction is this: it is a maſs of ſunken ſtone, in length 850 fathoms, extending from about 60 fathoms eaſt of St. Carlo's rocks, on the eaſt, to about 300 fathoms weſt of the Shovel, on the weſt. Another pier is made from Andurn Point towards the before-mentioned breakwater, about 400 fathoms in length, having an inclined kant, forming an angle of about 120°. Of the firſt, about 500 fathoms in the middle are ſtraight, and 170 fathoms at each end inclined to the ſtraight parts in an angle of 120°. Theſe inclined ends prevent the inrun of the ſea from agitating the water, and ſhelter a greater extent of the ſound. The two kants of the eaſtern end of the break-water, and weſtern end of the pier, repel the waves in ſuch a manner as to prevent them from paſſing in any material degree through the opening between. The improvements are conſtructed of large blocks of ſtone, thrown promiſcuouſly into the ſound in the line of the breakwater, leaving them to find their own baſe, which is about ſeventy yards broad, and the top is intended to be about ten yards in width, at the level of ten feet above the low water of an ordinary ſpring tide. The principal part of the ſtone uſed for the works is brought from quarries at the head of Catwater, in ſmall veſſels, of from 50 to 100 tons, with a crane fixed in their decks to take out the ſtones, and throw them into the water. The expences neceſſary to complete the undertaking were eſtimated at 1,150,000*l.*: the quantity of ſtone required 2,360,000 tons. The coſt of the firſt year was calculated at 60,000*l.*: 170,000 tons of ſtone have been depoſited, and 500 yards in length of the mole are already apparent above low water, and the expence ſo far has been conſiderably within the eſtimate preſented by Mr. Rennie to the lords of the admiralty. At a more advanced ſtate of the buſineſs, it is contemplated to erect a cut-ſtone pier on the top of the great breakwater, and build two light-houſes on each extremity, to aſſiſt ſhips entering the ſound.

The *Eddyſtone light-houſe*, at the mouth of the ſound, five leagues ſouth of Plymouth, is neceſſarily an appendage of the moſt important kind to the harbour, without which the entrance to it would be extremely dangerous. There is a duty payable by ſhips paſſing the light-houſe, which is collected at all the neighbouring ports. Merchant ſhips only are ſubject to this tax, thoſe belonging to the king are free. For an account and hiſtory of the Eddyſtone light-houſe, ſee vol. xii.

Stonehouſe is a populous town, containing about 5000 inhabitants, ſituated on the road leading from Plymouth to Plymouth-dock, and almoſt connecting the latter with the former by the continuation of buildings. The ſtreets are generally irregular, but moſt of them paved, and the houſes handſome and convenient. Stonehouſe bridge, erected over a ſmall creek of the ſame name, is a neat ſtone fabric of one arch. The revenue ariſing from its toll is conſiderable, and paſſes to the lords of the manor. Stonehouſe has ever been the property of individuals; as early as the 27th of Henry III. it belonged to Joel de Stonehouſe, and has ſince, by various marriages, paſſed into the family of Mount Edgecumbe. By the laſt cenſus the number of houſes was found to be 566, and the population 5174. There are a chapel, work-houſe, and market-place; but the moſt important public buildings are the Royal Marine barracks, a handſome range of uniform granite edifices, in the form of a quadrangle, and capable of containing upwards of 1000 men, with their officers. At Stonehouſe, and connecting it with the borough and town of Plymouth, is the Royal Naval hoſpital, which is an immenſe eſtabliſhment, under the ſuperintendance of a governor, lieutenants, and medical officers. Beſides the chapel, diſpenſary, and officers' reſidences, there are ſeven large, commodious buildings ſurrounding the lawn, each containing ſix wards, and capable of accommodating 959 perſons, officers and ſailors. The ſick and wounded are brought in boats from their ſhips, and landed at a quay immediately adjacent to the hoſpital. The Royal Military hoſpital, of a more recent erection than the former, is ſituated on the oppoſite bank of the ſtream, and conſiſts of only four diſtinct buildings. Its government is ſimilar to the other. Adjacent to Plymouth are ſeveral inland towns and villages of minor conſequence. St. Budeaux, about five miles north of Plymouth, is a pleaſant village, formerly the property of ſir William Gorges, the only deſcendant of whom is ſaid to be the celebrated Gorges, who commanded the Chouans in Brittany during the latter part of the French revolution. The church is a plain ſimple edifice, erected in the 14th century, with the materials of an older ſtructure. Buckland-Monachorum is entitled to notice for its handſome church, conſiſting of a nave, ſide aiſles, tranſepts, a tower, with turrets and pinnacles. The remains of the Drake family are depoſited here, with ſeveral handſome monuments to their memory, as well as to that of lord Heathfield, the brave commander at the famous ſiege of Gibraltar. There are alſo the villages of Lipſon, Widey, Tamerton, Crabtree, and Compton. Polwhele's Hiſtory of Devonſhire, folio. Beauties of England, vol. iv. Picture of Plymouth.

PLYMOUTH-*Dock*, ſometimes denominated *Dock*, in the hundred of Roborough, and pariſh of Stoke-Damerell, Devonſhire, is ſituated weſt of Plymouth, with the town of of Stonehoufe only intervening. It is placed on the eaftern bank of Hamoaze. The manor, excepting a part of the dock-yard, is the property of the St. Aubyn family, who inherit it from fir William Morice, fecretary of ftate to Charles II., and mentioned by Clarendon as inftrumental to the reftoration. In this family reft the prefentation to the living of Stoke-Damerell. The ftreets are regular, interfecting each other at right angles, and generally well built. The pavement is of the marble with which the neighbourhood abounds, and after a fhower its veins have a beautiful appearance. Though of fuch confiderable magnitude, it is wholly of modern date, and owes its origin and rapid increafe to the eftablifhment of the dock-yard and naval arfenals. It was made a king's yard in the latter part of the reign of William III., before which it was a mere hamlet of a few houfes. The greater part of the town has been erected fince 1760. The number of inhabitants in Dock is about 25,000, and the houfes 2400. They are erected by the inhabitants on leafes for ninety-nine years, fubject to a fmall annual quit rent. The town and the dock-yard are defended by lines. They were commenced in the reign of George II., but the works have been much improved under an act made in the 21ft of his prefent majefty, George III. On the north-eaft and fouth fides the town is bounded by a fod wall, about twelve feet high, which was built in 1787. The weftern fide is fkirted by the walls of the dock-yard and gun-wharf. Without the lines is a ditch from twelve to eighteen and twenty feet deep, excavated from the folid flate and limeftone rock. In this line of fortification are three barrier gates; the North barrier, the Stoke barrier, and the Stonehoufe barrier. Round the whole extent are planted pieces of ordnance, at regular diftances. The other fortifications are a battery on mount Wife; another at the Obelifk hill; and a redoubt or block-houfe on mount Pleafant, without the lines, which command the whole. It is in contemplation to fortify the town regularly, and the bufinefs is actually begun; but the dock-yard may be commanded from many of the adjacent eminences, all of which muft be fortified alfo, at an expence that would erect feveral diftinct yards! The town, being circumfcribed by this boundary of defence, does not admit of any increafe of building within it. A new town without the lines, named Morice-town, is alfo the property of the St. Aubyn's family. Dock has two chapels, and feveral meeting-houfes for fects of different denominations, which are very numerous. The parifh church is fituated about a mile from the town. There are few charitable inftitutions, perhaps in confequence of the recent growth of the town. The poor-houfe is extenfive, and will contain nearly 300 perfons: picking oakum for the dock-yard affords conftant employment to its inmates. The town, not being incorporated, is under the jurifdiction of the county magiftrates, who hold their feffions quarterly here. The inhabitants are fupplied with water from the fprings on Dartmoor, by an aqueduct fimilar to that of Plymouth. Markets are held three days in the week in the new market place, lately erected by fir John St. Aubyn. The government houfe is a handfome building, erected when lord Lennox commanded here; it is appropriated folely to the difpatch of military bufinefs, court-martials, &c. and has in front a grand parade. Here are eight different barrack eftablifhments, which afford conveniencies for 3000 men. The naval department confifts of an admiral and rear admiral, deputy judge advocate, and commiffioner for the payment of feamen's wages. Near the grand parade ftands the telegraph, by which a communication is kept up with the Admiralty in London, through thirty-fix different ftations. Inftances have occurred of a fhort meffage being tranfmitted to London, and an anfwer returned, in fifteen minutes. (See Post and Telegraph.) The dock-yard, even in its prefent unfinifhed ftate, is acknowledged to be one of the fineft in the world. When it was firft ufed as a naval arfenal is uncertain; but as the bafon and its dock are the moft ancient, and were not made till the reign of William III., it feems evident that this was a place of little confequence before that period. The wall, which feparates the yard from the town, is of flate and limeftone, and in fome places thirty feet high. The area within the wall is feventy-one acres and thirty-fix poles; including the projecting parts of the jetties. The entrance to the dock-yard from the land fide is from Fore-ftreet, by a large gate for carriages, &c., and a fmall one for foot paffengers. No perfon is fuffered to enter, unlefs well known, or in uniform, without an order from the commiffioner. Immediately within the gates is the mafter porter's houfe; and clofe by is the chapel, the tower and one aifle of which are as old as 1700, the other aifle is of much more recent date. In front of the chapel is the military guard-office, and over that the navy pay-office. From the gates, a flat paved road, fkirted with elms, leads to the officers' dwelling-houfes, which are of brick, and thirteen in number. From hence to the lower part of the yard, which has been levelled from the folid rock, is a defcent by a flight of fteps, leading to two handfome buildings, the northernmoft of which is the joiner's fhop, the other is ufed as an office. Directly in front of thefe is the bafin and dock, made in the reign of William III. The bafin is a large excavation, in which all the boats belonging to the yard, as well as the launches employed in moving fhips, are kept; the water flows into it through an opening about feventy feet wide. Within the bafin is a dock, fufficiently capacious for a feventy-four gun fhip; its length is 197 feet 3 inches; its width, 65 feet 10 inches; and its depth, 23 feet 1 inch. The bafin is bounded on each fide by jetty-heads, which are platforms projecting over the fea, fupported by wooden pillars driven full of nails, to prevent the worms from perforating them. Ships of all fizes lie alongfide thefe jetties without grounding, and here all veffels are brought to be fitted out. On the fouth jetty is a landing place, called the mafter attendant's ftairs, where all ftores returned from fhips are landed, and thofe to be fent to them fhipped off. Adjoining this jetty is the rigging houfe, a handfome building, 480 feet long, and three ftories high, forming one fide of a quadrangle. This fabric is of lime-ftone, with the coins and cornices of Portland ftone. Within it the rigging for the fhips of war is kept in fuch a ftate of forwardnefs, as to be fit for ufe at a very fhort notice. Over the rigging is the fail loft, where all the fails are cut out and made. The remaining three fides of the quadrangle are ftore-houfes, in which the various articles neceffary to equip the fleets are kept. Advancing fouthward is a flip for hauling up and graving the bottoms of fmall veffels, fuch as floops of war, cutters, &c. Beyond this is the Camber, a long canal, about feventy feet wide, terminating at the upper end in a bafin, where boats lie; on the north fide of which is the boat-houfe, where boats are built and repaired. Here, before the year 1768, were the bounds of the yard; all thence to the fouthward is ftill called the "new ground." The black-fmith's fhop is fituated fouth of the canal; it is a fpacious building, about 210 feet fquare, and contains forty-eight forges. The largeft anchors made here weigh five tons; they are made of iron bars forged together, and are moved in and out of the fire by the aid of cranes.

 The

The quantity of coals burnt in 1802 was 876 chaldrons and 23 bushels. The anchor-wharf fronts the blacksmith's shop. Near this wharf are three slips, whereon large ships are built; and adjoining them is a boiling-house, in which the planks that are to receive a particular curve are boiled in water for a considerable time, and being afterwards applied hot to their places are immediately fastened. Northward of the slips are the mast-house and pond; in the former the different masts and yards are made of many pieces of balk, formed to fit into each other, then rounded and pressed together with iron hoops driven on red-hot. The pond is a large piece of water, inclosed from the sea by a very strong wall, of at least 10 feet in thicknefs, and about 380 feet long; the top of which is laid flat with large flags of coarse granite. The water flows in through two openings about forty feet wide, over which are light wooden bridges. An immense number of masts, yards, &c. are always kept in this pond, to prevent their cracking, from exposure to the sun. Near the south end of the mast-house is a small mount, generally called "Bunker's Hill," on the summit of which is a watch-house and a small battery. Under this hill is a small powder magazine, and near it a slip for building cutters and small vessels. Returning from the interior of the yard, the rope-houses first engage the attention. These are two buildings of limestone, two stories high, and twelve hundred feet long, running parallel to each other. In the upper stories twine is made, and yarns prepared for the cables, which are *layed* (twisted together) below. The largest cables that are made are 25 inches in circumference, and 100 fathoms long; they weigh 116 cwt. 1 qr. and 16lb., and contain 3240 yarns. One of these buildings was partly consumed by an accidental conflagration in June 1812. The whole of the machinery was destroyed, and only 400 feet of the rope-house saved. The loss was estimated at 15,000*l*. In 1776 considerable alarm was excited from an attempt of John Aitken, commonly called "Jack the painter," to destroy the dock-yard with fire; he was afterwards detected in a similar endeavour at Portsmouth, and hanged. (See PORTSMOUTH.) The mould or model loft, where the different parts of ships to be built are laid down according to plans sent from the Navy Board, is in front of the store-house, and is the last building of importance in that part of the yard south of the basin. On the north jetty is a landing place, called the North-stairs, where officers not on duty generally land. Near it is a house, where pitch is kept continually boiling, to be applied to the bottoms and seams of ships. The double dock is the first of three, very near each other, for line of battle ships, and so denominated from its capability of containing two ships at the same time. The dock gates, by which the water is kept out of the docks, form, when closed, the segment of a circle, with its convex side toward the sea: they are made of timbers strongly put together and hung on each side of the mouth of the dock. As soon as a ship is taken into dock, which is always at high water, the gates are shut and locked; the water within the dock then runs out through sluices made for the purpose, till the ebb tide has ceased; the sluices are then shut, and the water which may still remain is thrown out by engines on the plan of pumps, worked by horses. The ship is taken out by opening the sluices, and suffering the water to attain an equal height within as without, when the gates are opened without difficulty. The second dock, called the Union, or North dock, is 239 feet 4 inches long, 86 feet 7 inches wide, and 26 feet 10 inches deep, and is faced with Portland stone. The New Union, or North New dock, 259 feet 9 inches long, 85 feet 3 inches wide, and 27 feet 8 inches deep, was made in the year 1789, and is on the same plan. Near the head of this latter dock is the burning place for old copper; and further northward, are the plumbers', braziers', and armourers' shops, and the bricklayers' and stone cutters' yards. Behind all this side of the yard, the rock, having never been levelled, rises very high and irregular: on it are a few sheds and storehouses. Every person belonging to the dock-yard is under the command of the commissioner, from whom all orders are received, and who has it in his power to discharge workmen for neglect of duty. The gun-wharf is separated from the dock-yard by North-corner street; it was begun in 1718 or 1719, and completed about 1785. The buildings are in general good, but very heavy, and in the Dutch style. They were projected by the late sir John Vanburgh, who was then attached to the ordnance department. The quantity of ground within the walls is four acres and three quarters. Here are two principal store-houses, of three stories high, for 80,000 muskets, pistols, and other small stores; a number of sheds for gun-carriages, &c.; a powder magazine, and a cooperage. The dock-yard, as well as the gun-wharf, is rated to the poor, and pays house and window-tax for the dwellings; but neither tithes, church rates, nor land-tax. The diversity of employments, ingenuity, and manual activity, exhibited in the various departments of the dock-yard, present a very interesting spectacle to those who have not been accustomed to appreciate the effects of human industry on a large scale. The bay or estuary of Hamoaze, on which the dock-yard is situated, is a commodious basin about four miles long, and half a mile wide, where in times of peace a very considerable part of the English navy is laid up in ordinary. The port admirals, hospital and prison ships, are always stationed here, and those that have undergone, or are about to receive repair in the dock. The ships are moored by large chains of iron, sixty fathoms long, consisting of 120 links, and having at the end a large anchor. On the banks of this harbour are other establishments of government: the powder magazine, higher up, consists of several detached stone buildings; the powder-kilns, erected for drying damaged powder; and on the bank of a creek of the harbour running to the S.W. is the South-down brewery, where all the beer for the fleet is brewed. In the vicinity of Dock are several small towns, of which Stoke is the most important. It is an ancient village, and has considerably enlarged itself within a few years. The church is situated at a short distance from the town, consisting of three aisles and a tower: the period of its erection is unknown. Morice-town, on the north side of Dock, near the ferry which crosses the Tamar, is increasing very fast in size and consequence. There are other villages in the neighbourhood, which will be treated of in our description of SALTASH. Immediately opposite to Dock is the delightful peninsula of Mount-Edgecumbe, the seat of the earl of Mount-Edgecumbe. The mansion was completed in the reign of queen Mary, and is antiquated in its appearance. It contains a few good paintings and portraits, and is pleasantly situated on the side of a wooded hill, from whence the prospect is variegated and comprehensive. The grounds occupy an area of about three miles in circumference, and are divided into parks, lawns, woods, terraces, kitchen and flower gardens. The estate became the property of the present family about the beginning of the 16th century from an intermarriage; by which connection they also became the proprietors of Stone-house. On the heights bordering the park of Mount-Edgecumbe stands Maker-church, the tower of which is uſed as a medium for conveying ſignals from the admirals' ſhips in Hamoaze to ſhips in the Sound, and alſo to forward the information of any fleets or veſſels of war in the offing, or paſſing up or down Channel. Polwhele's Hiſtory of Devon, folio. Beauties of England, vol. iv. Picture of Plymouth and Dock.

Plymouth, a maritime county, in the eaſtern part of the ſtate of Maſſachuſetts, containing 35,169 inhabitants, and ſubdivided into 18 townſhips, of which Plymouth is the chief. Within the counties of Plymouth and Briſtol there were, in 1796, in actual work, 14 blaſt and ſix air-furnaces, 20 forges, ſeven ſlitting and rolling mills, beſides a number of nail ſhops, and others for common ſmithery. Theſe furnaces, ſupplied from the neighbouring mines, produce annually from 1500 to 1800 tons of iron-ware. The forges, at an average, manufacture more than 1000 tons annually, and the ſlitting and rolling mills at leaſt 1500 tons. The manufactures of theſe mills have given riſe to various others dependent upon them, ſuch as cut and hammered nails, ſpades, and ſhovels, card teeth, ſaws, ſcythes, metal-buttons, cannon-balls, balls, fire-arms, &c. In theſe counties are alſo manufactures of hand-bellows, combs, ſheet-iron for the tin-manufacture, wire, linſeed oil, ſnuff, ſtone and earthen ware. The iron-works, called the Fæderal furnaces, are ſeven miles from Plymouth harbour.

Plymouth, the capital of the above county, is a poſt-town and port of entry, 42 miles S. from Boſton, to which belongs an extenſive townſhip, more than 80 ſquare miles, is about 16 miles in length, and more than five in breadth, containing, by the cenſus of 1791, 2495 inhabitants, and in 1810, 4228. The town, or principal ſettlement, containing more than two-thirds of the inhabitants, lies on the N.E. part of the townſhip, near a ſtream, called the "Town-brook," which flows from a large pond, bearing the name of "Bellington ſea." The principal ſtreet croſſes the ſtream, and is interſected by three croſs ſtreets, extending to the ſhore; another ſtreet runs weſterly on the N. ſide of the brook. The town is compactly built, and contains about 200 dwelling houſes, a handſome meeting-houſe, court-houſe, and gaol. Here are two precincts, one including the town and the diſtrict of Hobbs-Hole and Eel river; the other at Monument Ponds, a village about ſeven miles E. from the town, beyond the highlands of Monument. The ſoil near the coaſt is generally good; the reſidue of the townſhip is barren, and remains a foreſt, conſiſting partly of pine and partly of oak. The harbour is ſpacious, but ſhallow; formed by a long and narrow neck of land, called "Salthouſe beach," extending ſoutherly from Marſhfield and terminating at the Gurnet head, and by a ſmaller beach within, running in an oppoſite direction, and connected with the main land near Eel river, about three miles from the town. On the Gurnet is a light-houſe, and on Salthouſe-beach is placed one of the huts, erected and maintained by the Humane Society of Maſſachuſetts, for the reception and relief of ſhipwrecked mariners.

The principal buſineſs of the town is the cod-fiſhery, employing about 2000 tons of ſhipping and about 300 men annually. Many of the fiſhing veſſels make voyages to the ſouthern ſtates in the winter ſeaſon. The exports in 1795 exceeded 70,000 dollars, and in 1796 amounted to near 130,000 dollars. The produce of the fiſhery was formerly ſold at Boſton, or Salem; but it is now almoſt wholly exported from the town. The proceeds of the foreign voyages are generally conveyed to Boſton for a market. During the war for independence, Plymouth ſuffered much, and was reduced to a ſtate of great diſtreſs; but it has ſince revived, and both the town and its environs have been improved. A ſtage paſſes to Boſton twice a-week, and an aqueduct is conſtructed for bringing freſh water to the inhabitants. The townſhip abounds with ponds (amounting to more than 100) and ſtreams. Bellington ſea covers near 300 acres, about two miles from the town, and from it runs a ſtream, which ſupplies the aqueduct. South pond is much larger. Many of the ponds abound with white and red pearch, pike, and other freſh-water fiſh, and in the numerous brooks which run into the ſea are found excellent trout. Theſe ponds and ſtreams are frequently ſcenes of amuſement for parties of both ſexes, in the ſummer ſeaſon. At the villages of Monument Ponds and Eel river, and in ſome other parts of the townſhip, many of the inhabitants are farmers; and in the town the gardens are numerous and well-cultivated, and aided by the aqueduct will furniſh a ſupply adequate to the wants of the inhabitants.

The ſituation of the town is pleaſant and healthful, but the eaſterly winds of the ſpring are noxious. Although the market is not regularly ſupplied, fowl, fiſh, poultry, and wild fowl are plentiful, and cheaper, perhaps, than in any other ſea-port of the ſame ſize. The people are ſober, induſtrious, and friendly. Plymouth is the firſt ſettlement in New England, in 1620, but is peopled, principally, by the deſcendants of the ancient ſtock, intermixed with a few foreigners. The rock on which their forefathers firſt landed, was conveyed, in 1774, from the ſhore to a ſquare in the centre of the town. Although fiſhing and foreign commerce engage at preſent almoſt the whole native capital of the town, a variety of circumſtances will probably render it, at ſome future period, a conſiderable manufacturing town.

Plymouth, a town in Litchfield county, Connecticut, containing 1882 inhabitants.—Alſo, a port and half-ſhire town in Grafton county, New Hampſhire, on the S. ſide of Baker's river, at its mouth, where it falls into the river Pemigewaſſet; 45 miles N. of Concord; incorporated in 1763, and containing 937 inhabitants.—Alſo, a town of New York, in Onondago county; lying about 12 miles S.E. of Geneva, on a beautiful declivity on the E. ſide of Seneca lake, and commanding a view of the whole lake. The ſituation is healthful and pleaſant, well watered by copious ſprings: more than twenty houſes were built here in 1796. The new ſtate road interſects this town, and here is a ferry acroſs the lake to another thriving town on the oppoſite ſide.—Alſo, the name of two townſhips in Pennſylvania, one in Luzerne county, and the other in that of Montgomery; the former has 765, and the latter 895 inhabitants.—Alſo, a town of North Carolina, about 20 miles from Edenton, and a place of conſiderable trade; the navigation is free and open, and the two places have a conſtant communication acroſs Albemarle ſound.—Alſo, a ſettlement on the S. peninſula of St. Domingo, in the dependence of Jeremie.—Alſo, a townſhip in Windſor county, Vermont, formerly Saltaſh, 12 miles W. of Windſor; containing 834 inhabitants.

Plymouth *Town*, a town in the iſland of Tobago. N. lat. 10° 10′. W. long. 60° 3′.

Plymouth *Marble*, among our *Artificers*, a term uſed for a ſort of marble dug in great plenty about Plymouth, and in ſome parts of Devonſhire, where it lies in very thick ſtrata, and whence it is brought in large quantities to us; and when wrought looks little leſs beautiful than ſome of the Italian marble.

It is very hard and firm, and of a beautiful texture; its ground is a blueiſh-white, and its variegations are principally a pale red, and in ſmaller quantities brown and yellow: theſe

these lie in very orderly beds, and often there is a very agreeable glow of a faint red diffused through the whole substance. It is remarkable even in its whole structure, and is therefore capable of a more than ordinarily elegant polish.

PLYMPTON, a township in Plymouth county, Massachusetts; 45 miles S.E. of Boston, containing 900 inhabitants.

PLYMPTON-MAURICE, or EARLS-PLYMPTON, a borough and market town in the hundred of Plympton, and county of Devon, England, is 216 miles W.S.W. from the metropolis, and 39 miles S.W. from Exeter. According to the population returns of 1811, it contains 92 houses, and 715 inhabitants. It is one of the stannary towns, and formerly constituted part of the honour of Plympton, to which no fewer than eighty-nine knight's fees were appendant, when it was granted by Henry I. to Richard de Rivers, or Redverse, earl of Devonshire. That nobleman built here a magnificent castle, and made it the capital seat of his barony. He and his successors likewise conferred upon the town considerable privileges. Baldwin de Rivers granted it a charter of incorporation, which was successively confirmed and extended by Edward III., Richard II., and Henry V. and VI. Queen Elizabeth granted a new charter, under which the town is now governed by a mayor, a recorder, eight aldermen, a bailiff, and a town clerk. The mayor is invested with the powers of a justice of the peace, and holds a court of record at stated intervals.

Plympton sends two members to parliament, and has done so, though irregularly, since the reign of Edward I. These are elected by the mayor and free burgesses, who are estimated at one hundred in number. The mayor is the returning officer. The market day here is Saturday every week; besides which there are four annual fairs. The houses are chiefly disposed in two streets, extending at right angles with each other in the form of the Roman letter T. The church is only a chapel annexed to the church of Plympton St. Mary, an adjoining parish and village. The living is a curacy, in the patronage of the dean and canons of Windsor. The other public buildings are a guildhall and a free-school. The guildhall is an ancient structure supported on stone pillars, and contains, among other portraits, one of sir Joshua Reynolds, painted by himself. The free-school was erected in 1664, by one of the trustees of Elizeus Hele, esq. of Fardel, who bequeathed 1500*l.* *per annum*, to be expended in charitable purposes. Of this school, the father of sir Joshua Reynolds was master for many years, and in the master's house belonging to it the celebrated artist himself was born on the 16th July 1723. See REYNOLDS.

PLYMPTON *St. Mary*, above-mentioned as adjoining to Plympton-Earls, is a village and parish of very considerable antiquity. The church was formerly collegiate for a dean or provost, and four prebendaries with other ministers. This college is said to have been of the foundation of one of the Saxon kings. It was dissolved by William Warlewast, bishop of Exeter, on the refusal of its religious to discard their wives in obedience to the decrees of the synod, held in London A.D. 1102, by which celibacy was enjoined to the clergy. That prelate afterwards settled here a prior and canons regular of the order of St. Augustin. The benefactions conferred on this priory by earl Baldwin and others were immense, and rendered it the richest monastic institution in the diocese of Exeter. Its revenues at the time of the dissolution were valued at 912*l.* 12*s.* 1*d.* *per annum*. The scite was granted by queen Elizabeth to Arthur Champernon, esq. Here was also an hospital for lepers. The parish of Plympton St. Mary, exclusive of Plympton-Earls, contains, according to the parliamentary returns of 1811, 272 houses, 1727 inhabitants.

Near Plympton is Boringdon, the ancient seat of the Parkers, and now the property of their representative John Parker, earl of Boringdon. The mansion which was built in the fourteenth century has been converted into a farm-house, and has consequently undergone great alteration and diminution since the removal of the family seat to Saltram, in the neighbourhood, by lady Catharine Parker. Saltram is remarkable for the beauty of its situation; for exclusive of the diversity of landscape displayed by the surrounding pleasure grounds, the prospects which it commands "of Plymouth sound, the town, citadel, Mount Edgecumbe, and the endless variety of effects peculiar to the sea and harbour, are extremely interesting and amusing." The house is the largest in the county, and contains a valuable collection of paintings by ancient and modern masters. Beauties of England and Wales, vol. iv. by John Britton, F.S.A. and E.W. Brayley.

PLYNTERIA, Πλυντηρια, in *Antiquity*, a festival in honour of Aglaurus, the daughter of king Cecrops, or rather of Minerva, who had from that lady the name of Aglaurus. These were the holidays of Minerva, which was reckoned unlucky, at which time, according to Xenophon, they shut up the temples of that goddess. It was expressly forbidden to pursue any work whatever on the day of this festival, even in cases of necessity. It was then allowable by the law of Solon to swear by the three names of Jupiter Propitious, Expiator, and Defender. For the ceremonies observed at this solemnity, see Potter, Archæol. Græc. lib. ii. cap. 20. tom. i. p. 425.

PNEUMA, Πνευμα, in Hippocrates, sometimes imports spirit, air, or vapour, and frequently it signifies the breath, that is, the air drawn in by inspiration, and expelled during expiration. But pneuma, by the above quoted author, is often used to express a difficult, short, and laborious respiration.

PNEUMATICS, PNEUMATICE, called also *Pneumatology* and *Pneumatosophy*, the doctrine and contemplation of spirits, and spiritual substances.

The word is formed of the Greek πνευμα, *spiritus*, *breath*; whence, from the different acceptations of that word either as an incorporeal substance, or as air, there arise two sorts of pneumatics.

PNEUMATICS, in the *Schools*, is frequently used for the doctrine of spirits; as God, angels, and the human soul. See SPIRIT.

In this sense pneumatics coincide with what we otherwise call metaphysics.

PNEUMATICS is more commonly used among us for the doctrine of the air; or that part of natural philosophy which treats of the nature, properties, and effects of the air.

Some make pneumatics a branch of mechanics; because it considers the air in motion, with the effects of it. It is certainly a sister of hydrostatics; the one considering air in the same manner that the other does water.

Wolfius, in lieu of pneumatics, uses the word *aerometry*, *q. d.* the art of *measuring the air*.

The doctrine and laws of pneumatics will be found under AIR, ATMOSPHERE, ELASTICITY, GRAVITY, COMPRESSION, CONDENSATION, RAREFACTION, EXPANSION, &c.

PNEUMATIC *Engine*, *Machina* or *antlia pneumatica*, denotes the air-pump.

PNEUMATIC *Sect* of physicians, a subdivision of the methodic sect, which took place at Rome, and is ascribed to two or three different persons, who are severally esteemed its founders.

founders. The chief diftinction of the pneumatic fect, confifted in referring to a particular fpirit, or *pneuma*, which they confidered to arife from the heart and arteries. See Medicine, *Hiftory of*.

PNEUMATOCELE, from πνευμα, *wind*, and κηλη, *a tumour*, in *Surgery*, a fwelling containing air: alfo a wind rupture; a complaint which is fpoken of by many furgical writers; but has no real exiftence. Hernial tumours do, indeed, fometimes include air, which is combined within the protruded bowel, or elfe produced in the cellular membrane from putrefaction in the floughing ftate of the difeafe. Yet it is not the accidental prefence of fuch air that conftitutes the rupture or hernia; but the protrufion of fome of the vifcera from the cavity of the abdomen.

PNEUMATODES, a word ufed by Hippocrates to exprefs a perfon who fetches his breath fhort and quick: and fometimes for one who has his belly or ilia much diftended by flatulencies. *Pneumutias* is alfo ufed in the fame double fenfe.

PNEUMATOMACHI, Πνευματομαχοι, in *Ecclefiaftical Hiftory*, ancient heretics, fo called, becaufe they oppofed the divinity of the Holy Spirit, placing him in the number of creatures.

PNEUMATOMPHALOS, from πνευμα, *wind*, and ομφαλος, *the navel*, in *Surgery*, a rupture of the navel, containing air, or fuppofed to be produced by wind.

PNEUMATOSIS, in *Medicine*, from πνευμα, *air*, a term denoting large accumulations of air in any cavity of the body. It may include, therefore, not only *tympanites*, but *emphyfema*. In this fenfe Sauvages employs the term, and defcribes four fpecies of pneumatofis; the firft he calls *fpontanea*, as it arifes without any evident caufe; the fecond, *traumatica*, which originates from wounds of the lungs, whence the air is permitted to efcape into the cellular membrane of the whole body; the third, *venenata*, arifing from poifons; and the fourth, *hyfterica*, when the air is confined to the ftomach and inteftines. (See his Nofol. Method. clafs x. gen. 5.) See alfo Emphysema.

PNEUMONANTHE, in *Botany*, a name given by many botanical writers to a fpecies of gentiana, called alfo by fome the *calathian* violet.

PNEUMONIA, in *Medicine*, from πνευμων, *the lungs*, fignifies an inflammation of the lungs and its invefting membrane. It includes, therefore, both the forms of the difeafe, peripneumony and pleurify. See Peripneumony.

PNEUMONICS, Πνευμονικα, medicines proper in difeafes of the lungs, in which refpiration is affected.

The word is formed from the Greek πνευμων, *lungs*, or πνευμα, *fpiritus*, *breath*.

Of this number are fulphur, lung-wort, hyffop, ground-ivy, and colt's-foot; they are ufed in phthifes, afthmas, peripneumonies, pleurifies, &c.

PNEUMORA, in *Entomology*, a genus of infects of the order Hemiptera. The generic character is; body ovate, inflated, diaphanous; head inflected, armed with jaws; thorax convex, carinate beneath; wing-cafes deflected, membranaceous; legs formed for running. There are three fpecies of this genus, and they all appear to confift of a mere hollow inflated membrane; by rubbing together their ferrate or toothed legs, they make a fhrill kind of noife morning and evening; and they follow a light; they are fo nearly allied to the cricket tribe, that they have been ranked by Fabricius with the Gryllus genus.

Species.

Immaculata. Green fpotted with white; wing-cafes immaculate. It inhabits the Cape of Good Hope. In Fabricius it is the Gryllus papillofus.

Maculata. Wing-cafes green, with fquare white fpots.

6-Guttata. Wing-cafes green, with two white fpots; abdomen with three white fpots on each fide. This is found at the Cape of Good Hope.

PNIGITIS Terra, in the *Materia Medica of the Ancients*, a name given at different periods of time to two different fpecies of earth: the terra pnigitis of Diofcorides and Pliny being a grey marle, and the pnigitis of Galen a black clay.

The laft of thefe is faid to be a very valuable aftringent, and is found in many parts of this kingdom, particularly in the neighbourhood of London, and well deferving to be introduced in the practice of phyfic.

PNIGMOS, from πνιγω, *I fuffocate*, in *Medicine*, a kind of fuffocation, from whatever caufe: it is very often ufed to exprefs that of hyfteric fits in women.

PNIX, a word ufed by phyficians to exprefs the fuffocation from hyfteric fits, or any other caufe.

PO, in *Geography*, *Padus*, (which fee,) a river of Italy, which rifes in mount Vifo, at the N.W. part of the marquifate of Saluzzo, feven miles N. of Chateau Dauphin, traverfes a part of the marquifate of Saluzzo, the province of Chieri, the duchy of Montferrat, the Milanefe, Mantuan, and Ferrarefe, and runs into the gulf of Venice, by a great number of mouths.

Po, *Department of*, one of the fix departments into which Piedmont was divided, after having been united to the French republic, Auguft 26, 1802, the other five being Doire, Sefia, Marengo, Tanara, and Stura. This department is formed of the diftrict of Turin, quatre-vallois, and the marquifate of Sufa, in N. lat. 45°, lying between Doire and Stura, and on the W. and N.W. bounded by the Alps, containing 264 fquare leagues, and 395,193 inhabitants. It is divided into three circles, *viz*. Sufa, including 61,236 inhabitants; Turin, 232,313; Pignerol, 101,634. Situated at the foot of the Alps, and broken into vallies, hills, and plains, the foil of this department is of various qualities. The plains and vallies, in general, are fertile. In the mountains are mines of copper, lead, iron, quarries of marble, ftone, flate, &c.

Po, *Lower*, a department of the new kingdom of Italy, compofed of the duchy of Ferrara, and the valley of Comachio.

Po, *Upper*, a department of Italy, formed of the Cremonefe, the Cremafco, and the Lodefan.

Po, *the Vale of the*, one of the four regions into which Italy may be divided; it extends about 260 miles in length, and in breadth, where wideft, 150. It is bounded by the Alps and Apennines on the N., W., and S., and on the E. lies open to the Adriatic. The fecond region is the tract inclofed by the Apennines, forming the Roman and Tufcan territories. The third is confined to the Campania Felix, and its immediate dependencies, fuch as the borders and the iflands of the bay of Naples, and of the plains of Pœftum. The laft confifts of Abruzzo, Apulia, Calabria, and the fouthern extremities of Italy.

The firft of thefe regions has been reprefented by many, as perhaps the moft fertile and the moft delicious territory in the univerfe. It owes this fertility to the many ftreams that defcend from the bordering mountains, and furnifh a conftant fupply to the majeftic river that interfects it. Mr. Euftace, in the fecond volume of his "Claffical Tour," avoids the name frequently given to the plains of the Po or of Milan. *Lombardy* (which fee) is, he fays, a barbarous appellation,

appellation, derived from one of the fierceſt tribes that invaded and waſted this delicious region. After more than two centuries of devaſtation and reſtleſs warfare, they were exterminated by Charlemagne; and our author does not ſee why their name ſhould ſurvive their exiſtence, or why a barbarous term ſhould diſplace a Latin appellation.

Po, a city of China, of the ſecond rank, in Kiang-nan; 260 miles S.S.W. of Peking. N. lat. 33° 45′. E. long. 115° 14′.—Alſo, a town of China, of the third rank, in Chan-tong; 262 miles S. of Peking. N. lat. 35° 48′. E. long. 115° 14′.

POA, in *Botany*; ποα, a general name for *graſs*, or *herbage*, is appropriated by Linnæus to this, one of the moſt common and copious genera of the graſs family.—Linn. Gen. 34. Schreb. 49. Willd. Sp. Pl. v. 1. 385. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 95. Prodr. Fl. Græc. Sibth. v. 1. 53. Schrad. Germ. v. 1. 278. Ait. Hort. Kew. v. 1. 153. Brown Prodr. Nov. Holl. v. 1. 179. Purſh North-Amer. v. 1. 78. Juſſ. 32. Lamarck Illuſtr. t. 45. Michaux Boreal-Amer. v. 1. 67.—Claſs and order, *Triandria Digynia*. Nat. Ord. *Gramina*.

Gen. Ch. *Cal.* Glume of two ovate, pointed, awnleſs valves, collecting the numerous florets into a two-ranked ovate-oblong ſpikelet. *Cor.* of two ovate, ſharpiſh, concave, compreſſed valves, rather longer than the calyx, membranous at the edges. Nectary of two acute or torn leaflets, gibbous at the baſe. *Stam.* Filaments three, capillary; anthers forked at each end. *Piſt.* Germen ſuperior, roundiſh; ſtyles two, reflexed, villous; ſtigmas feathery. *Peric.* none, the corolla unites itſelf to the ſeed, and does not ſeparate. *Seed* one, oblong, pointed, compreſſed at each ſide, covered by the corolla.

Obſ. In ſome ſpecies the florets are connected at the baſe by a fine web of folded ſilky threads.

Eſſ. Ch. Calyx of two valves, many-flowered. Spikelet rounded at the baſe. Corolla of two ovate, rather acute, awnleſs valves, membranous at the edge.

Of this large and valuable genus the 14th edition of Syſt. Veg. contains 33 ſpecies; Willdenow reckons up 61; but we ſuſpect the laſt of theſe, *P. plumoſa*, not to be different from his n. 38, the Linnæan *tenella*. The Britiſh ſpecies are 18, which we ſhall particularize, along with a few of the moſt remarkable exotic ones. Mr. Brown deſcribes 21 *Poæ*, moſtly new, in his New Holland Prodromus.

P. *aquatica*. Reed Meadow-graſs. Linn. Sp. Pl. 98. Willd. n. 1. Engl. Bot. t. 1315. Curt. Lond. faſc. 5. t. 12. Knapp. t. 44. (Gramen aquaticum majus; Ger. Em. 6.)—Panicle erect, branched, lax. Spikelets ſix-flowered, linear. Florets obtuſe, with ſeven ribs.—In ditches and about the banks of rivers, perennial, flowering in July, conſpicuous for its large ſize and reedy aſpect. Its colour is a light, not at all glaucous, green. *Stem* five or ſix feet high. *Leaves* flat, acute, broad, ſtraight, rough at the edges and keel, with a nearly ſmooth ſheath, and a ſhort, entire, very blunt *ſtipula*. *Panicle* very large and numerouſly branched, the ſubdiviſions rather zigzag, rough. *Calyx* almoſt equal, whitiſh, poliſhed. *Florets* from five to eight, ſcarcely more, nearly cylindrical, ſomewhat diſtant, obtuſe, rough, purpliſh at the outer part.

Cattle are ſaid to be fond of this graſs, though coarſe. It uſually makes a principal part of marſh-land hay.

P. *fluitans*. Floating Meadow-graſs. Scop. Carn. ed. 2. v. 1. 73. Fl. Brit. n. 2. Ait. n. 2. Engl. Bot. t. 1520. Knapp. t. 45. (Feſtuca fluitans; Linn. Sp. Pl. 111. Curt. Lond. faſc. 1. t. 7. Mart. Ruſt. t. 113. Willd. Sp. Pl. v. 1. 426. Glyceria fluitans; Brown Prodr. N. Holl. v. 1. 179.)—Panicle branched, divaricated. Spikelets cloſe-preſſed, cylindrical, many-flowered. Florets obtuſe, with ſeven ribs, and intermediate ones at the baſe.—In ditches and ſlow rivulets, perennial, flowering throughout the ſummer, in moſt parts of Europe. Mr. Brown found it at Port Jackſon, New South Wales, the ſeeds probably having been carried from England by accident. This writer has ſeparated it as a genus from *Poa*, chiefly becauſe of the *ſtigmas* being repeatedly branched, and the *nectary* a ſolitary fleſhy ſcale. But the neighbouring ſpecies of *Poa*, wanting theſe characters, ſeem too ſtrictly akin to this to allow of ſuch a ſeparation. The *root* creeps extenſively. *Stems* ſpreading widely, floating for the moſt part, with their lower *leaves*, on the ſtill ſurface of the water. *Sheaths* long, compreſſed, ſtriated, ſmooth. *Stipulas* ſhort, triangular, jagged. The larger branches of the *panicle* ſpread widely, and are accompanied by ſhort more erect ones. The ſhort intermediate ribs, at the bottom part of each *floret*, afford a peculiar character.

P. *diſtans*. Reflexed Meadow-graſs. Linn. Mant. 32. Willd. n. 55. Ait. n. 22. Engl. Bot. t. 986. Knapp. t. 47. (P. retroflexa; Curt. Lond. faſc. 6. t. 10. P. ſalina; Pollich. Palat. v. 1. 89.)—Panicle branched, ſpreading; the branches at length reflexed. Spikelets of five, very obtuſe, ſlightly five-ribbed, ſhining florets.—In meadows, and amongſt rubbiſh, chiefly near the ſea, in various parts of England. Jacquin found it in Auſtria. The *root* is fibrous, perennial. *Stems* ſeveral, about a foot high, decumbent at the lower part, ſtriated, ſmooth to the touch. *Leaves* glaucous, flat, with long *ſheaths*, and a blunt emarginate *ſtipula*. *Panicle* erect, with branches of various lengths, ſeveral together, remarkable for being ſtrongly bent downwards as they advance in age. *Florets* much like the *aquatica* in their form and arrangement, but with only five ribs. Vahl in his Symbolæ, v. 2. 19, moſt unaccountably confounds this graſs with Gouan's *P. divaricata*, Willd. n. 56.

P. *maritima*. Creeping Sea Meadow-graſs. Hudſ. 42. Willd. n. 39. Ait. n. 16. Engl. Bot. t. 1140. Knapp. t. 46. Fl. Dan. t. 251.—Panicle branched, rather cloſe. Spikelets of five bluntiſh, nearly cylindrical, ſlightly five-ribbed florets. Root creeping.—Native of ſandy ſalt-marſhes, in various parts of Europe, flowering in July. Akin to the laſt, but the creeping *root*, branches of the *panicle* erect after flowering, rarely divaricated, and longer, more acute *florets*, diſtinguiſh the preſent ſpecies.

P. *dura*. Hard Meadow-graſs. Scop. Carn. ed. 2. v. 1. 70. Sm. Prodr. Fl. Græc. Sibth. n. 181. Schrad. Germ. v. 1. 284. Hoſt. Gram. Auſtr. v. 2. 53. t. 73. (Cynoſurus durus; Linn. Sp. Pl. 105. Willd. Sp. Pl. v. 1. 413. Pollich Palat. t. 1. f. 1.)—Spike nearly ſimple. Spikelets ſeſſile, alternate, crowded, rigid, obtuſe, compreſſed, all turned one way, of about five elongated ribbed florets.—Native of ſandy waſte ground in the ſouth of Europe, flowering in May and June. *Root* annual, of many long ſimple fibres. *Stems* numerous, two to four inches high, ſpreading in every direction, leafy, rigid, ſometimes branched at the baſe. *Leaves* glaucous. *Spike* ovate, an inch long, rigid, its zigzag ſmooth ſtalk viſible at the back only. *Spikelets* about a dozen, linear-oblong, glaucous, all their glumes ſtrongly ribbed, and each bordered with a broad white membrane. This ſpecies is cloſely allied to the preceding and the following ones, nor has it any character of *Cynoſurus*. It has not been found in Britain.

P. *procumbens*. Procumbent Sea Meadow-graſs. Curt. Lond. faſc. 6. t. 11. Engl. Bot. t. 532. Knapp. t. 49. Fl. Brit. n. 5. Ait. n. 3. (P. rupeſtris; With. 146. t. 26. Gramen maritimum, paniculis aſperis loliaceis; Bocc.

Bocc. Muf. 135. t. 95.)—Panicle lanceolate, denfe, rough, turned one way; common ftalk round. Spikelets cylindrical, of about five bluntifh, ribbed florets.—Native of fandy inundated wafte ground, near the fea, in England, Holland, and Sicily, flowering in fummer. The *root* is annual. Whole plant much like *P. dura*, but more flender, taller, and lefs rigid, with a doubly compound *panicle*, not a *fpike*, and far more numerous, fmaller, cylindrical *fpikelets*.

P. *rigida*. Rigid Meadow-grafs. Linn. Sp. Pl. 101. Willd. n. 40. Curt. Lond. fafc. 2. t. 4. Knapp. t. 48. Engl. Bot. t. 1371.—Panicle lanceolate, denfe, fmooth, two-ranked, turned one way; common ftalk bordered. Spikelets of feven cylindrical, riblefs florets.—Common on the tops of dry walls, and in barren fandy ground, annual, flowering in June. The whole plant is four or five inches high, of a peculiarly rigid, elaftic, wiry habit, and purplifh-brown hue. Every part is fmaller than in the laft.

P. *divaricata*. Straggling Meadow-grafs. Gouan Illuftr. 4. t. 2. f. 1. Willd. n. 56. Desfont. Atlant. v. 1. 75. (Gramen phalaroides, fparfâ paniculâ, minimum anguftifolium; Barrel. Ic. t. 44. f. 1.)—Panicle capillary, divaricated, with corymbofe branches. Flower-ftalks club-fhaped. Florets four. Leaves briftle-fhaped.—Native of the fouth of France and of Barbary. A fmall, delicate, flender, annual grafs, with the habit of *Aira caryophyllea*, for which the plate of Barrelier has been quoted, a circumftance that has caufed fome confufion. It flowers in the fpring, and has a very elegant afpect. The thickened *flower-ftalks*, and the crowded little fhining *fpikelets*, are characteriftic of this fpecies.

P. *Eragroftis*. Spreading Meadow-grafs. Love-grafs. Linn. Sp. Pl. 100. Willd. n. 24. Ait. n. 12. Sm. Fl. Græc. Sibth. v. 1. 57. t. 73. Cavan. Ic. t. 92. (P. megaftachya; Schrad. Germ. v. 1. 288. Briza Eragroftis; Linn. Sp. Pl. 103. Willd. Sp. Pl. v. 1. 405. Schreb. Gram. t. 39. G. eranthemum, feu ερανγρωστις; Barrel. Ic. t. 43.)—Panicle erect, branched, fpreading. Spikelets linear, many-flowered. Florets tumid, with three keels. Stipula briftly.—Native of Greece, Barbary, Italy and Switzerland, though not known to Haller as a Swifs plant; fee the following fpecies. A very elegant annual grafs, with numerous *ftems*, from one to two feet high, quite fmooth. *Leaves* fpreading, grafs-green; their *ftipula* of many fine hairs. *Panicle* ample, loofe, much branched. *Spikelets* linear, alternate, ftalked, green or purplifh, fhining. *Florets* from ten to thirty-fix, imbricated, ovate, tumid, roughifh, with three diftant ribs or keels. The above two plants of Linnæus are certainly one and the fame, differing merely as to number of *florets*. The ripe *feed* being unconnected with the *corolla*, makes the plant a *Poa*, not a *Briza*.

P. *elegantiffima*. Elegant Meadow-grafs. (P. Eragroftis; Villars Dauph. v. 1. 135. Schrad. Germ. v. 1. 287. Schreb. Gram. t. 38. P. n. 1450; Hall. Hift. v. 2. 219. Gramen phalaroides, fparfâ Brizæ paniculâ minus; Barrel. Ic. t. 44. f. 2. G. paniculis elegantiffimis, minimum; Scheuchz. Agr. 192. t. 4. f. 2.)—Panicle erect, branched, capillary, fpreading. Spikelets lanceolate, fcarcely ten-flowered. Florets compreffed, keeled, three-ribbed. Stipula briftly.—Native of Switzerland, France, and Italy. About one-third the fize of the foregoing, with fharper *leaves*, dark purple tapering *fpikelets*, and about a quarter of the number of *florets*, which are compreffed and keeled, with one obfolete rib at each fide, near the edge. This is commonly taken for *P. Eragroftis* of Linnæus, but erroneoufly, he having never been acquainted with the grafs before us, though he cites fome of its fynonyms for his *P. Eragroftis* above defcribed.

P. *compreffa*. Flat-ftalked Meadow-grafs. Linn. Sp. Pl. 101. Willd. n. 42. Ait. n. 18. Knapp. t. 57. Engl. Bot. t. 365. Hoft. Gram. Auftr. v. 2. 51. t. 70.—Panicle denfe, turned one way. Stem afcending, compreffed. Florets angular, connected at the bafe by a folded web.—Common in dry fields and on walls, in Europe as well as America. Mr. Purfh fays it is known in the laft-mentioned country by the name of Blue Grafs. It flowers with us in July and Auguft, and has a perennial creeping *root*. The whole plant is rather glaucous, about a foot high, readily known by its very flat *ftem*, and denfe *panicle*, whofe branches fpread but for a fhort period, while in full bloffom. *Florets* from three to nine, clofely imbricated, ovate, angular, three-ribbed, bluntifh, purple juft under the white membranous tip, connected together at the bottom by a fet of fine cottony fibres, fhorter than in fome other fpecies.

P. *alpina*. Alpine Meadow-grafs. Linn. Sp. Pl. 99. Willd. n. 2. Ait. n. 4. Engl. Bot. t. 1003. Hoft. Gram. Auftr. v. 2. 49. t. 67. Knapp. t. 50 and t. 117.—Panicle loofe. Spikelets heart-fhaped, of about four flowers. Glumes ovate, rather falcate, not connected by a web. Lower ftipulas very fhort.—Native of the mountains of Lapland, Germany, and Scotland, as well as of the Bithynian Olympus, flowering in fummer. *Root* tufted, perennial, with fmooth fibres. *Stems* from four to twelve inches high; leafy below; fmooth, fhining, often purplifh, above. Radical *leaves* forming a denfe tuft; thofe on the ftem furnifhed with much longer *fheaths* as well as *ftipulas*. *Panicle* fpreading, fhort, fomewhat ovate, with angular, nearly fmooth, branches. *Spikelets* broad, fhining, elegantly variegated with green, white, and a purplifh brown. "*Florets* ovate, acute, membranous at the edge, the lower part of which is filky, and the keel ftill more fo:" feveral longifh hairs, but no complicated web, are found at the bafe. In wet feafons the *flowers* are changed into buds, forming young plants, as fhewn in Scheuchz. Agroft. t. 4. f. 14, and in Engl. Bot.

P. *flexuofa*. Zigzag Meadow-grafs. Sm. Fl. Brit. 101. Engl. Bot. t. 1123. Knapp. t. 51. Ait. n. 5. (P. laxa; Willd. n. 3. Schrad. Germ. v. 1. 291.)—Panicle denfe, fomewhat drooping, zigzag. Spikelets three-flowered. Glumes ovate, connected by a web. Stipulas all lanceolate.—Difcovered on the Scottifh mountain of Ben Nevis, by the late Mr. J. Mackay, flowering in July. Schrader mentions it as a native of various alpine fituations in Germany. The *root* is fomewhat creeping. This fpecies is of a more flender habit, and paler glaucous afpect, than the *alpina*, and differs effentially in the above characters. The glumes are not filky at the keel nor margin.

P. *bulbofa*. Bulbous Meadow-grafs. Linn. Sp. Pl. 102, α and γ, not β. Willd. n. 50. Ait. n. 21. Engl. Bot. t. 1071. Knapp. t. 53, with the root of another fpecies. (G. vernum, radice afcalonitidis; Vaill. Paris. t. 17. f. 8.)—Panicle flightly zigzag. Spikelets four-flowered. Glumes veinlefs, connected by a web. Leaves finely ferrated. Stem bulbous at the bafe.—Native of France, Italy, Germany, Switzerland, and England, in dry fandy places. With us it is found only on the fandy fea-coaft, over which its little dry bulbs are blown in various directions, during fummer, till the firft rains of autumn make them vegetate, and take deep root. The plants then yield abundance of fhort denfe herbage, a welcome fpring food for cattle, and flower in April or May; having, meanwhile, formed young bulbs, like a minute kind of garlick, which are difperfed, like their predeceffors, after the leaves wither. The *ftems* are naturally

naturally three or four inches high; in a garden they rife to above a foot, and the *leaves* are long in proportion. The ferrated *foliage*, the *bulbs*, the woolly web connecting the *florets*, and their broad veinlefs *glumes*, clearly afcertain this fpecies. The *panicle* is fmall, hoary or filvery, and purplifh. —We have gathered this grafs for the moft part in a viviparous ftate, on the open ground near St. John Lateran, at Rome, in the early fpring. This is probably the variety β of Schrader and other German authors; but the β of Linnæus is a very different, much taller, and greener grafs, with long and extremely narrow *leaves*, an elongated *panicle*, of numerous viviparous *flowers*, and peculiarly rough *flower-ftalks*. Oriental fpecimens are in the Linnæan collection, apparently fent by Haffelquift. This is what Scheuchzer has defcribed in his *Agroftographia* 211, and what Morifon has figured, fect. 8. t. 5. f. 14, after Bauhin's *Theatrum* 32. But the beft reprefentation is in Barrelier, t. 703. f. 2. We are afraid to defcribe this as a fpecies, without feeing fome fpikelets in a natural ftate; but we are perfuaded it is perfectly diftinct, and that there are, befides, other bulbous *Poæ*, hitherto confounded with the true *bulbofa*.

P. *cæfia*. Sea-green Meadow-grafs. Fl. Brit. 103. Engl. Bot. t. 1719. Ait. n. 7.—Panicle fpreading. Spikelets ovate, five-flowered. Glumes lanceolate, filky-edged, unconnected by any web. Stipula very fhort and blunt.—Native of the Highlands of Scotland, flowering in June and July. It feems unknown in every other country. The *root* is perennial, fibrous, tufted. Whole plant very glaucous. *Stems* erect, about a foot high, round, fmoothifh, with two joints near the bottom. *Leaves* bluntifh, flat, rough to the touch, except on the back near the bafe. *Sheaths* roughifh, about as long as the leaves. *Stipula* fometimes variable in fize and fhape. *Panicle* much branched, rough. *Flowers* variegated with purple, white, and green, each outer valve marked with a filky line of hairs, near the edges, and on the keel; but there is no complicated web connecting the florets. The doubtful reference to Withering is to be ftruck out of Fl. Brit., as belonging to our *glauca*, hereafter mentioned, which Mr. Knapp has by miftake figured for *cæfia*.

P. *trivialis*. Roughifh Meadow-grafs. Linn. Sp. Pl. 99. Willd. n. 6. Ait. n. 8. Curt. Lond. fafc. 2. t. 6. Knapp. t. 54. Engl. Bot. t. 1072. (P. dubia; Leers Herborn. 28. t. 6. f. 5.)—Panicle fpreading. Spikelets three-flowered. Glumes lanceolate, five-ribbed, connected by a web. Stem roughifh. Stipula elongated.—Very general in meadows and paftures throughout Europe, particularly where the foil is moift, flowering from June to September, and forming perennial tufts of valuable herbage for the food of domeftic cattle. The *ftems* are a foot and half high, rough when drawn through the hand, by which this fpecies is known from the equally common and ufeful *P. pratenfis*. The *leaves* are grafs-green, pliant, with fheaths of their own length, crowned with an oblong pointed *ftipula*. *Panicle* ample and fpreading. *Florets* with five ftrong ribs, wanting in many of the laft defcribed. The web which connects them is copious and long. *P. fetacea* of Hudfon's firft edition is a mere variety, with narrow involute leaves.

P. *pratenfis*. Smooth-ftalked Meadow-grafs. Linn. Sp. Pl. 99. Willd. n. 8. Ait. n. 9. Curt. Lond. fafc. 2. t. 5. Knapp. t. 55. Engl. Bot. t. 1073.—Panicle fpreading. Spikelets four-flowered. Glumes lanceolate, five-ribbed, connected by a web, ftem fmooth. Stipula fhort and blunt.—Equally common with the laft, but it will grow in much drier fituations It flowers rather earlier, comes fooner into leaf, but Mr. Curtis remarks that the *trivialis* produces a better crop as the feafon advances. That excellent obferver found the fmoothnefs of the *ftem* the beft criterion for diftinguifhing this from the laft; which Hudfon and Ehrhart have likewife noted. The *panicle* of the prefent fpecies is moft inclined to affume a purple hue; and the web connecting the *florets* is peculiarly long and complicated. *P. anguftifolia*, Linn. Sp. Pl. 99, is a trifling variety, whofe lower *leaves* are narrower and more rigid, with roughifh fheaths, and the *panicle* is fmaller. This variety is figured in Leers, t. 6. f. 3.

P. *humilis*. Short Blueifh Meadow-grafs. Ehrh. Calam. n. 115. Sm. Fl. Brit. 1387. Ait. n. 10. (P. fubcærulea; Engl. Bot. t. 1004. P. cærulea; Knapp. t. 118.) —Glaucous. Panicle fpreading. Spikelets ovate, of about three acute florets, connected by a web. Stipula very fhort and blunt.—Native of mountainous paftures in Weftmoreland, Cumberland, and Anglefea, flowering in June. *Root* perennial, creeping, with villous fibres. *Stem* from four to fix inches high. Whole plant glaucous. *Florets* ribbed, green at the bafe, purple and brown in the middle, white and membranous at the margin. Schrader, who directs us to ftrike out the fynonyms of Willdenow, Haller, and Scheuchzer, quoted in Fl. Brit. (as belonging to his *fupina*, Fl. Germ. v. 1. 289.) thinks the prefent plant differs from *pratenfis* in its glaucous colour only. We agree that this is the chief diftinction, but it feems to us effential. Hudfon made our plant a variety of *pratenfis*, but he miftook it for the Linnæan *alpina*, a widely different fpecies.

P. *annua*. Annual Meadow-grafs. Linn. Sp. Pl. 99. Willd. n. 16. Ait. n. 11. Curt. Lond. fafc. 1. t. 6. Mart. Ruft. t. 98. Engl. Bot. t. 1141. Knapp. t. 52. —Panicle widely fpreading. Spikelets ovate. Florets a little remote, five-ribbed, deftitute of a web. Stem oblique, compreffed.—Common every where in wafte as well as cultivated ground throughout Europe, flowering at all times of the year when the weather is mild. In gardens it is a troublefome weed; in paftures it affords excellent food for cattle, and is rather improved than damaged by being trodden. Though the *roots* are annual, the lower part of the *ftems* fpread by numerous fibres, and thus the plant extends itfelf widely during fummer, as well as by fcattering abundance of feed. The herbage is bright green, not glaucous. *Leaves* flat, with a crumpled appearance here and there. *Sheaths* compreffed, crowned with a fharp *ftipula*. *Spikelets* ovate, variegated with green and white, rarely reddifh. *Florets* a little filky at the back, membranous at the edge, deftitute of a web at their bafe.

P. *glauca*. Slender Glaucous Meadow-grafs. Fl. Dan. t. 964. With. 148. Sm. Fl. Brit. 1388. Engl. Bot. t. 1720. Ait. n. 19. (P. cæfia; Knapp. t. 56. P. n. 1468; Hall. Hift. v. 2. 224. Feftuca airoides; Lamarck Dict. v. 2. 464, excluding the reference to Haller's n. 1439, which is Feftuca pumila of Willd. Sp. Pl. v. 1. 420.)—Panicle glaucous, flender, erect. Spikelets ovate, of about three flowers. Glumes bluntifh, filky-edged, unconnected by any web. Stipula very fhort.—Found on the loftieft mountains of Wales and Scotland; perennial, flowering in June. The whole plant is very glaucous, and of a much more flender habit than any of the foregoing, in which laft character it approaches the following. Schrader indeed fufpects it to be but a mountain variety of the *nemoralis*. The *fpikelets* however are more ovate and clofe, and we believe the glaucous colour to be an important diftinction. If however the proximity of this, in other refpects, to *nemoralis*, and of our *humilis* to *pratenfis*, fhould be thought to invalidate that character, we fubmit our opinion to the teft of cultivation by feed, which alone can decide the queftion.

P. *nemoralis*. Wood Meadow-grafs. Linn. Sp. Pl. 102. Willd.

Willd. n. 47. Ait. n. 20. Engl. Bot. t. 1265. Knapp. t. 58. Fl. Dan. t. 749. Hoft. Gram. Auftr. v. 2. 51. t. 71. —Panicle and leaves flender. Spikelets lanceolate, of about three flowers. Glumes acute, obfoletely five-ribbed. Stipula very fhort, notched.—This grafs compofes the tall thin herbage in woods or groves in the north of England, as well as rather mountainous woods throughout Europe. In lowlands it is lefs frequent, except on chalk. It is perennial, flowering in July and Auguft. The whole plant is extremely flender, grafs-green, one and a half, or two feet high. *Stems* fmooth, flattifh. *Leaves* rough to the touch, taper-pointed. *Sheaths* fmooth, tight, compreffed, fhorter than the leaves. *Stipula* very fhort, notched, or torn. *Panicle* nearly erect, loofe, capillary, zigzag, rough. *Spikelets* fmall, pale green, lanceolate rather than ovate. *Glumes* rough at the keel. *Florets* from two to four, fhining, lanceolate, filky at their backs and hairy at the bafe, but not connected by a web.

There is a ftouter variety, Hudfon's *P. anguftifolia* α, the true *nemoralis* being his β.

P. *decumbens*. Decumbent Meadow-grafs. Scop. Carn. v. 1. 69. With. 147. Sm. Fl. Brit. 107. Ait. n. 24. Schrad. Germ. v. 1. 305. Engl. Bot. t. 792. Knapp. t. 59. Hoft. Gram. Auftr. v. 2. 52. t. 72. (Feftuca decumbens; Linn. Sp. Pl. 110. Willd. Sp. Pl. v. 1. 424. Fl. Dan. t. 162.)—Panicle nearly fimple, condenfed, erect. Spikelets ovate, of four florets, fcarcely exceeding the calyx. Stipula briftly.—Native of fpongy bogs, in barren fandy or mountainous fituations, flowering in July. This fpecies is perennial, of a remarkably harfh and rigid habit, lying clofe to the ground, except when in flower, and of no agricultural ufe. The *roots* creep moderately, and are very ftrong. *Stems* about a foot long. *Leaves* ftraight, tapering, acute, rather glaucous, with long hairy *fheaths*, and a briftly tuft of hairs in the place of the ufual membranous *ftipula*. *Panicle* zigzag, of a very few large purplifh-glaucous *flowers*, of fo ambiguous an appearance, that botanifts have differed much about the genus of the grafs in queftion; fome making it a *Melica*, to which, as Linnæus remarks, it has a degree of affinity in habit as well as ftructure. Koeler efteems it a *Bromus*, and Bernhadi, like Decandolle, cuts the knot, by making it a new genus, we know not by what effential character. Mr. Brown is inclined to refer this puzzling plant to his own *Triodia*, Prodr. Nov. Holl. v. 1-182.

The extra-european fpecies of *Poa* afford a wide range for the botanift, too extenfive for our prefent purpofe. They require a more general inveftigation than they have yet received, though abundance of particular fpecies have been defcribed with fufficient care. Thofe of American growth agree beft, as might be expected, with our's. Some tropical ones have fo different an afpect, that it is to be wifhed they poffeffed fome generic diftinction. Many of them are fingularly elegant when minutely examined. We apprehend that a great number ftill remain undefcribed.

Poa, in *Agriculture*, a genus of graffes, which principally forms the green covering of the fields: the meadow-grafs.

There are feveral fpecies, fome of which are highly ufeful as field-graffes.

Poa *Anguftifolia*, the narrow-leaved meadow-grafs, which Mr. Sole fays is a very fweet grafs, efpecially for hay, but like the trivialis, is liable to go off after mowing. It is difperfed fparingly in the meadows about Hinton Abbey.

Poa *Annua*, the dwarf or white meadow, or Suffolk grafs, which, according to Mr. Sole, is the quickeft in growth of all the graffes, coming up, blooming, and ripening its feeds in the courfe of one month. It ought therefore to be called *menfual;* but as it will keep time with no other grafs, it is not worth fowing. It is always leaving the ground bare in patches, except there happens to be an *agroftis* to fill its place. It is however a very fweet grafs, and very generally liked by animals of moft forts.

Poa *Aquatica*, the reed meadow-grafs, which, Mr. Sole fays, is an excellent grafs in its native foil, the fens of the ifle of Ely, growing to the height of fix feet. It is ufually cut when about four feet in height, and when dry, is bound into fheaves; and it moftly undergoes a heat in the ftack that improves its quality. It is found an excellent fodder for milch cows, but horfes are not fond of it. In that place it is called *fodder* by way of eminence, other forts of coarfe hay being denominated *ftover*, which fignifies *coarfe ftuff*, and it is called *white leed*, from its drying of a white colour.

Poa *Bulbofa*, the bulbous meadow-grafs, which Mr. Sole finds to have all the good qualities of the pratenfis, in fo far as its fize will admit, and it is proper for hilly dry grounds and poor foils, where it delights to grow. It is found in the hilly dry paftures about Newton St. Loe.

Poa *Compreffa*, the compreffed, or flat ftalked meadow-grafs, which Mr. Sole thinks an excellent grafs for parks and fheep-walks, as both deer and fheep are fond of it; and as it is a dwarf grafs, the blades feldom exceeding two inches in height, it forms a fine turf, and caufes the flefh of the animal to cut fhort, and be fine flavoured. It is found in bloffom in fome places about Claverlton Down, and probably on the down itfelf, but the fheep there never fuffer a bent of it to blow.

Poa *Diftans*, the fen meadow-grafs, which Mr. Sole finds an exceedingly fweet grafs, affording very rich milk, but it is difficult to cultivate, as it delights in miry fituations. It grows in moft fea-marfhes, and abundantly about Cottenham, and the fens of Cambridgefhire.

Poa *Loliacea*, the hard or darnel meadow-grafs, which Mr. Sole thinks the moft infignificant of all the poas, but which has one good property, that of growing where no other grafs is capable of living, as in the drieft parching fea-fands.

Poa *Maritima*, the fea meadow-grafs, which the fame botanift confiders as a fine nourifhing grafs, being the principal one of our beft falt-marfhes; but from its delighting in falt, is difficult of cultivation.

Poa *Paluftris*, the marfh meadow-grafs, which Mr. Sole thinks a fine exuberant grafs, and probably the beft dairy grafs. It grows in the rich marfhes in all parts of the ifland, particularly thofe that are frequently refrefhed by the occafional overflowings of rivers. It is valuable for laying down fpongy lands. It has often the height of four or five feet; and the panicle, when full blown, is extremely fine and flowing.

Poa *Pratenfis*, the great or fmooth-ftalked meadow-grafs, which, for the purpofes of agriculture, is confidered by Mr. Sole as the moft noble of all the graffes. Its foliage begins to fhoot and put on a fine verdure early in the fpring, but not fo foon as fome other graffes. Every animal that eats grafs is fond of it; while it makes the beft hay, and affords the richeft pafture. It abounds in the beft meadows about Laycock and Chippenham, and it has the valuable quality of abiding in the fame land, whilft moft other graffes are continually changing. According to fome, it delights in rather a dry than a moift foil and fituation, on which account it keeps its verdure better than moft others in dry feafons; but it thrives moft luxuriantly in rich meadows. It has been objected to by fome from its creeping roots, which are difficult to extirpate, of courfe it is probably the moft ſuited to permanent graſs lands. According to Curtis it is diſtinguiſhed from the rough-ſtalked meadow-graſs, by the ſtem being ſmooth when drawn between the finger and thumb, and while in that the membrane at the baſe of the leaf is long pointed, in this it is ſhort and blunt. And beſides, it only throws up flowering ſtems once in the ſeaſon, and is of courſe well ſuited for lawns, &c.

Poa *Setacea*, the fine meadow-graſs, which Mr. Sole conſiders as a fine rich graſs for upland paſtures, as it delights in a dry ſoil. It is found in the hilly paſtures about Newton, in Somerſetſhire. It is likewiſe an abiding graſs.

Poa *Trivialis*, the common or rough-ſtalked meadow-graſs, which Mr. Sole thinks a fine graſs for hay as well as paſtures, but inferior to the pratenſis. It delights in moiſture and ſheltered ſituations, on which account it is tender though productive. In rich land it grows tall; its height however is about two feet. It is ſaid by ſome to be well ſuited to good ſound moiſt loams. It is much eſteemed on the continent for dry paſtures and watered meadows, as it multiplies by ſeed as well as the root. It is of courſe proper to let the ſeeds fall. Its fattening property is conſiderable for cattle. It is, however, apt to go off after mowing, being overpowered by thoſe graſſes of the bent kind. Its radical leaves, as well as thoſe on the ſtem, grow much larger than in the pratenſis. In ſowing it the ſeeds ſhould be carefully ſeparated.

POAKE Root, in Virginia, is uſed to denote the ſolanum bacciferum. The Indians uſe it for a purge, though commonly deemed a poiſon. Phil. Tranſ. N° 454. § 1.

POBEDA, La, in *Geography*, a town of Spain, in Old Caſtile; 13 miles N. of Soria.

POBETTEN, a town of Pruſſia, in the province of Samland; 16 miles N.W. of Konigſberg.

POBIANITZA, a town of the duchy of Warſaw; 33 miles E.N.E. of Siradia.

POBINDEN, a town of Pruſſia, in the province of Samland; 15 miles N. of Königſberg.

POBLA, La, a town of Spain, in Catalonia; 25 miles N.W. of Salſona.

Pobla *de Llillett*, a town of Spain, in Catalonia; 20 miles E.S.E. of Urgel.

POBLACION, a town of Spain, in Navarre; 12 miles W. of Eſtella.

POBLEDA, La, a town of Spain, in Old Caſtile; 21 miles S.W. of Calahorra.

POBNITZ, a river of Bohemia, which riſes near Culmbach, on the borders of Sileſia, and runs into the Elbe, near Tetſchen.

POCAHONTAS, a town of Cheſterfield county, in Virginia, within the juriſdiction of Peterſburg, in Dinwiddie county; probably deriving its name from the famous princeſs Pocahontas, the daughter of king Powhatan. Morſe.

POCAR, a town of Naples, in Principato Citra; 7 miles W. of Salerno.

POCATSJETTI, H. M., in *Botany*, the name of a ſmall ſhrub which grows in Malabar. The leaves powdered and ſprinkled upon ulcers, repreſs luxuriant and fungous fleſh; and taken internally, they excite a ſweat, and diminiſh the paroxyſm of an intermitting fever.

Of the bark and root, powdered, and mixed with oil, an unguent is made, ſaid to be good for the itch, and other cutaneous diſorders.

POCCOON. See Puccoon.

POCHARD, in *Ornithology*, the name of a ſpecies of wild duck, called by ſome the *penelope* and *rothhals*, and by many in Engliſh the red-headed widgeon.

It is larger than the common widgeon, and is ſhorter and thicker bodied. This is the Anas *ferina* of Gmelin. See Duck.

POCHERRY, in *Geography*, a town of Hindooſtan, in Marawar; 5 miles S. of Ramanadporum.

POCK. See Pox.

Pock-*Wood*. See Guaiacum.

POCKESO, in *Geography*, a populous and commercial town of Africa, in the diſtrict of Axim, on the Gold Coaſt.

POCKET Sheriffs, in *Law*, ſheriffs nominated of the ſole authority of the crown. See Sheriff.

Pocket, in *Rural Economy*, a large ſort of bag, in which hops are packed up, in order to be ſold; being formed of a particular kind or quality of ſacking. See Hops.

Pocket *of Wool*, is half a ſack. See Sack *of Wool*.

The pocket contains uſually twenty-five hundred weight of wool.

Pocket *Inſtruments*, in *Surgery*, are ſuch as a ſurgeon ought always to have in readineſs, and may conveniently carry about him in a proper caſe: theſe are two lancets of different ſizes; the one proper to open abſceſſes, the other ſmaller, for bleeding; a pair of ſtraight ſciſſars, uſeful on many occaſions; a pair of crooked ſciſſars, proper to be uſed in dividing fiſtulæ, and in ſeveral other caſes; a pair of forceps, with teeth at one end, to remove dreſſings, and upon occaſion to extract ſplinters or thorns: theſe are alſo ſerviceable to the ſurgeon in his anatomical exerciſes; they are commonly made of ſteel, but thoſe of ſilver are much neater; a razor; a ſtraight inciſion-knife; a crooked inciſion-knife; a ſtraight double-edged inciſion-knife; a probe with one end broad and thin, proper for diſcovering a fiſſure in the cranium, and for many other uſes; and the other end rounded, to examine the depth and ſituation of wounds and ulcers. The neateſt probes are made of ſilver, though they are frequently made alſo of ſteel, ivory, or whalebone; a grooved probe or director, to direct the edge of the knife or ſciſſars in opening ſinuſes, or fiſtulæ, that by this means the ſubjacent veſſels, nerves, and tendons, may remain unhurt. The upper end of this inſtrument ſometimes is ornamented, and ſerves only for a handle; ſometimes it is made in form of a ſpoon, to contain powder to ſprinkle upon wounds or ulcers; ſometimes alſo this is made forked at the end, to divide the frænum of the tongue; a ſpatula to depreſs the tongue, in order to examine the ſtate of the tonſils, uvula, and fauces, when they are affected with any diſorders; it is alſo uſed to ſuſpend the tongue when the frænum is to be divided; for which purpoſe it is to be made with a fiſſure at its extremity, and ſhould therefore rather be made of ſilver than of any other metal. Beſides theſe, there ſhould be an ordinary ſpatula for ſpreading plaſters, ointments, and cataplaſms; and ſometimes, by means of their ſulcated extremity, they are of ſervice in raiſing up fractured bones of the cranium; ſeveral needles muſt alſo be kept here, ſome ſtraight and others crooked, for the ſtitching up of wounds, taking up of arteries, and many other uſes. Heiſter's Surg. p. 12.

Pocket *Medicines*. See Medicine.

POCKLINGTON, in *Geography*, is a market town and pariſh, ſituated partly within the liberty of St. Peter, York, and partly in Wilton-Beacon diviſion, in the wapentake of Harthill, Eaſt Riding of Yorkſhire. The town is diſtant from York 13 miles E. by S., and from London 197 N. by W. The market-day is Saturday every week, and there are four fairs annually. Here are held the petty ſeſſions for Wilton-Beacon diviſion of the wapentake of Harthill. The living is a vicarage in the patronage of the dean of York. According to the parliamentary returns of 1811, the houfes in this town were eftimated at 396, and the inhabitants at 1539 in number.

Several places in the vicinity of Pocklington merit the notice of the topographer and antiquary. The Roman road, called the Ermine-ftreet, paffes within two miles to the weft of the town. Londefborough-park, which it interfects at the diftance of three miles, is fuppofed by Drake, the hiftorian of Yorkfhire, to be the ancient Delgovitia, but the circumftances upon which he founds his opinion are by no means conclufive. This place was for many centuries a feat of the ancient and celebrated family of the Cliffords. It is now the property of the duke of Devonfhire, as defcendant from the daughter and heirefs of Henry Clifford, the fifth and laft earl of Cumberland. The houfe is fituated on elevated ground, and is furrounded by an extenfive and well wooded park. At Melburn, five miles to the fouth-weft of Pocklington, is the feat of fir Henry Vafavour, bart. The manfion is a large modern edifice of brick, and commands fome fine views of the weftern acclivities of the wolds. Stamford-bridge, eight miles to the north-weft, Drake conceives to be the fcite of the Derventio, but Camden fixes that ftation at Aldby, about a mile and a half to the northward. Here was fought, in 1066, one of the moft bloody battles recorded in the hiftory of England, between the forces of Harold II. and thofe of Tofti his brother, the banifhed earl of Northumberland, affifted by Harfagar, king of Norway. The conteft lafted from feven in the morning till three in the afternoon, when the Norwegians and rebels were routed with immenfe flaughter. Beauties of England and Wales, vol. xvi. by John Bigland.

POCKREKESKO, a river of North America, in New-Britain.

POCO Allegro, in the *Italian Mufic*, is not fo faft as allegro.

Poco *Largo*, intimates to play or fing a little flow. See Largo.

Poco *meno Allegro*, is ufed to fignify that the part it is joined to fhould be played or fung in a little lefs gay manner than allegro requires.

Poco *Prefto*, ferves to let us know that we ought to fing or play that part to which it is annexed, not quite fo quick as prefto requires it fhould.

POCOCK's Island, in *Geography*, an ifland in the Eaft Indian fea, S. lat. 6° 2′. E. long. 118° 12′.

POCOCKE, Edward, in *Biography*, a celebrated orientalift, was born at Oxford in 1604: he received the early part of his education at the free fchool of Tame, and in 1618 was entered a commoner of Magdalen Hall, Oxford. In 1620 he removed to Corpus Chrifti college, in which he obtained a fcholarfhip. He now began to apply himfelf to the ftudy of the oriental languages, and the ardour which he manifefted in the purfuit, caufed him to make extraordinary progrefs in a comparatively fhort time. In 1627 he began to prepare, from a MS. in the Bodleian library, a Syriac verfion of four epiftles, which were yet wanting to a complete tranflation of the New Teftament into that language. This work he finifhed in 1628, and in the fame year he was admitted probationary fellow of his college; and the epiftles coming to the knowledge of Gerard John Voffius, he carried them to Leyden, where they were printed under the infpection of Lewis de Dieu. Pococke was ordained prieft in that year; and having been appointed chaplain to the Englifh factory in Aleppo, he arrived at that city in 1630. He inftantly took advantage of the fituation; engaged a mafter in the Arabic tongue, and a fervant of the nation for the purpofe of familiar converfe in it. As a ftill furer guide, he undertook the tranflations of feveral Arabic books, among which was a collection of 6000 proverbs. Having received a commiffion from the famous Dr. Laud, bifhop of London, for the purchafe of Greek coins, and Greek and Oriental MSS., he was eager in obtaining them; though more than once the zeal which he fhewed for his employer expofed him to imminent danger from the plague. In 1636 he was nominated by the bifhop firft profeffor of the Arabic lecture founded by that munificent prelate at Oxford. He accordingly returned to take poffeffion, and in Auguft of the fame year he opened his lectures with an eloquent Latin oration, on the nature and ufe of the Arabic tongue. Having commenced his official duties, he obtained leave of abfence to embark with a learned mathematician, in 1637, for Conftantinople. Here he ftaid till 1640, and paffing through Paris on his return, he had an interview with the illuftrious Grotius, who was much gratified on being confulted by him on the Arabic tranflation of his celebrated work, "De veritate Chriftianæ Religionis."

On his arrival in England, he had the mortification and mifery to find his patron, bifhop Laud, a prifoner in the Tower. In 1643 he was prefented by his college to the rectory of Childrey, in Berkfhire, and he immediately fet himfelf to perform the functions of a parifh prieft, with all the modefty and fimplicity of his character. In the following year, the falary of his profefforfhip being feized by the fequeftrators as part of the archbifhop's eftate, Pococke was reduced to his country living. He thought it now fuitable to his fituation to marry, and in 1646 he formed an union with the daughter of Thomas Burdett, efq. of Hampfhire. Soon after this, by the intereft of the learned Selden, he obtained the reftoration of his falary, and was at the fame time completely protected from the violences of the foldiery. In 1648, the Hebrew profefforfhip at Oxford, with the prebend of Chrift-church annexed, was given to him; but as he fteadily refufed to fubfcribe the engagement, he was not deemed eligible. Attempts were made to deprive him of his prebend and both his profefforfhips; the former he actually loft, but by the interceffion of powerful friends, he was allowed to retain the latter. In 1650 he publifhed his "Specimen Hiftoriæ Arabum," and in 1652 he engaged to afford his affiftance to the editors of the Polyglott Bible, his tafk being the collation of the Arabic pentateuch. In 1654 he was in danger of being ejected from his living on account of ignorance and infufficiency; at leaft thofe were the charges preferred againft him by Cromwell's committee. Some of his Oxford friends, however, particularly Dr. John Owen, fo warmly reprefented the difgrace which would follow the rejection upon fuch grounds, of a man more eminent than almoft any other in Europe for found learning, that the profecution was abandoned. In 1655 he publifhed "Porta Mofis," being fix prefatory difcourfes of Mofes Maimonides, containing an account of the Jewifh doctrine and difcipline. Mr. Pococke added a Latin verfion, with a large appendix of mifcellaneous notes, and this was the firft fpecimen of the Hebrew prefs at Oxford. In 1659 he publifhed, according to his promife made to Selden, the annals of the patriarch Eutychius, in Arabic and Latin, with Selden's preface and notes. On the reftoration of Charles II. he obtained the reftitution of his prebend and canonry of Chrift-church, and in that year, 1660, he took his degree of D.D. He had the mortification to find, that in the new reign oriental literature fell into difcouragement, neverthelefs he continued through life to perform the duties of his profefforfhips. His other publications after this were "Carmen Abu Ifmaelis Tograi," Arab. et Lat.: "Gregorii Abul Farajii Hiftoria Dynaftarum," Arab. et Lat.: "Commentaries upon Micah, Malachi, Hofea, and Joel;" in thefe he is a defender of the purity of of the Hebrew text againſt the objections of ſeveral learned men, and he takes great pains to ſet in a ſtrong light the predictions of the Old Teſtament, generally ſuppoſed by Chriſtians to relate to Jeſus Chriſt. The laſt of theſe he publiſhed in 1691; and if he intended, which is not certain, to purſue the ſame plan with the other minor prophets, he was prevented therein by his death, which happened on the 10th of September, in that year, being in the 87th year of his age. A gradual diminution of ſtrength and bodily vigour had for ſome time, previouſly to this, indicated his approaching diſſolution, but his intellects and memory were continued almoſt unimpaired to the laſt. His body was interred in the cathedral of Chriſt-church, and on the north wall there is a monument, with an inſcription, from which the following is an extract, "Edwardus Pococke, S.T.D. cujus nomen audias, nihil hic defama deſideres." To the excellence of his private character, Mr. Locke bears the moſt ample teſtimony. He repreſents him as free, open, and intelligent in his converſation; ſincere, modeſt, humble, and tranquil, ſingularly charitable, and forgetful of injuries. He adds, "his life appeared to me one conſtant calm. To conclude, I can ſay of him what few men can ſay of any friend of theirs, nor I of any other of my acquaintance; that I do not remember I ever once ſaw in him one action, that I did, or could in my own mind blame, or thought amiſs in him."

As a ſcholar, his knowledge of language compriſed all the principal oriental tongues, with ſome European, beſides the Latin and Greek. He was father of a numerous family, of whom the eldeſt ſon, Edward Pococke, publiſhed under his father's direction, in 1671, an Arabic work, with a Latin verſion, entitled "Philoſophus Autodidactus, ſive Epiſtola Abu Jaafir Ebn Tophail de Hai Ebn Yokdhan." The deſign of the author Abu Jaafir Abn Tophail, who was a Mahometan philoſopher, is to ſhew, by an ingenious fiction, how human reaſon, by obſervation and experience, without any aſſiſtance, may arrive at the knowledge of natural things, and from thence riſe to ſupernatural, particularly to God and a future ſtate. For this purpoſe he ſuppoſes a perſon, Hai Ebn Yokdhan, brought up by himſelf, where he was altogether deſtitute of inſtruction, but what he could get from his own obſervations. Mr. Pococke had alſo prepared an Arabic hiſtory, with a Latin verſion, and actually ſent it to the preſs; but this performance, not being worked off when his father died, was withdrawn by him upon a diſguſt at his being diſappointed of ſucceeding him in the Hebrew profeſſorſhip. Biog. Brit.

Pococke, Richard, a diſtinguiſhed traveller, and a prelate of the Iriſh church, ſon of a clergyman of Southampton, was born in 1704. He was educated at his native place, whence he was removed to Corpus-Chriſti college, in Oxford. In 1731 he took the degree of bachelor of laws, and in 1733 that of doctor. About this time he made a tour on the continent, probably as tutor to ſome young man of rank. In 1736 he made a ſecond tour, in which he took his courſe through Holland, Germany, Hungary, and Italy, to Leghorn. In 1737 he embarked for Egypt, in which country he purſued his travels till the following ſpring. In the month of March, 1738, he embarked at Damietta for Paleſtine, and then took his road through Syria, Meſopotamia, Cyprus, Candia, and Leſſer Aſia, to Conſtantinople. He returned by ſea from Cephalonia to Meſſina, whence, through Italy, Germany, and Flanders, he proceeded homewards. He returned in 1741, having been abſent five years. The reſults of his obſervations and reſearches were given to the public, under the title of "Deſcription of the Eaſt, and ſome other Countries," of which the firſt volume, entitled "Obſervations on Egypt," dedicated to Henry, earl of Pembroke and Montgomery, appeared at London in 1743; and the ſecond, entitled "Obſervations on Paleſtine, Syria, Meſopotamia, Cyprus, and Candia," dedicated to Philip, earl of Cheſterfield, in 1745. Theſe publications were well received: his remarks chiefly relate to buildings, inſcriptions, and other remains of antiquity, but he has likewiſe many obſervations reſpecting manners and cuſtoms, and the products of nature and art, in the countries which he viſited.

When the earl of Cheſterfield was appointed lord-lieutenant of Ireland, in 1745, he carried Dr. Pococke with him as one of his domeſtic chaplains, and he ſoon appointed him archdeacon of Dublin. In 1756, the duke of Devonſhire, then lord-lieutenant, promoted him to the biſhopric of Oſſory. He was tranſlated to Meath in 1765, in which he died. Dr. Pococke, beſides being an Oriental traveller, made a tour in Scotland, and gave a deſcription of the baſaltic rock in the harbour of Dunbar, reſembling the Giant's cauſeway, which was printed in the Philoſ. Tranſ. vol. 32; alſo of ſome antiquities found in Ireland, printed in the ſecond vol. of the Archæologia, vol. ii. Several MSS. which he preſented to the Britiſh Muſeum, are preſerved in that repoſitory. Pococke's Travels.

POCOGNACA, in *Geography*, a town of Italy, in the department of the Mincio; four miles N. of Mantua.

POCOKOLIGO, a village of South Carolina; 15 miles from Combabec ferry, and 67 from Charleſton.

POCOMOCK, a river of the ſtate of Maryland, which diſcharges itſelf into the Cheſapeak bay, forming a large bay at its mouth, called "Pocomock bay." N. lat. 37° 50'. W. long. 75° 50'.

POCONA, a town of Peru; 60 miles S. of Cuzco.

POCUMMA, in *Botany*, a name given by the people of Guinea to a ſpecies of plant which they uſe as an aſtringent. Their manner of taking it is very ſingular; for they put the leaves among their dough, and bake them into a maſs with the bread, and then eat the whole together in their food. Phil. Tranſ. N° 232.

POCUTIA, or Pokucia, in *Geography*, a province of Poland, annexed to Auſtria, and included in the kingdom of Galicia.

POD, in *Botany* and *Vegetable Phyſiology*, has been conſidered as ſynonimous with the Latin *legumen*, as well as with *ſiliqua*; but it is now reſtricted to the latter, *legume* being uſed for the former. See Legume and Siliqua.

PODAGRA, ποδαγρα, thus called from πους, *foot*, and αγρα, *captura*, *ſeizure*, in *Medicine*, the gout in the feet.

Podagra *Dentium*, ſometimes, though with impropriety enough, is uſed for the tooth-ach.

Podagra *Lini*, in *Botany*, a name given by ſome of the later Greek writers to cuſcuta, or dodder, when found growing on the linum of flax. The Latins have called this *epilinum*, as they do the dodder growing on thyme *epithymum*; the earlier Greeks called this *linozoſtes*. Where this dodder takes root in a field of flax, it generally occupies many plants; and where it twines round them it cauſes protuberances and ſwelling, and has therefore been reſembled to the gout on that plant.

PODAGRARIA, a name given by many authors to the leſſer wild angelica, called alſo *herba Gerardis*.

PODALA, in *Geography*, a town of Hindooſtan, in the Carnatic; 18 miles W. of Ongole.

PODALIRIUS, in *Biography*, an illuſtrious phyſician, and reputed ſon of Æſculapius, is celebrated by Homer as having accompanied the Grecian army in the Trojan war, together with his brother Machaon. He appears to have been the younger brother, and to have been on the whole leſs

 diſtinguiſhed

diſtinguiſhed than Machaon; though, like him, he was married to the daughter of a king. On his return from the ſiege of Troy, he was ſhipwrecked on the coaſt of Caria, where he was hoſpitably received by a ſhepherd, who, having learned that he was a phyſician, took him to king Damæthus, whoſe daughter had accidentally fallen from the top of a houſe. Podalirius bled her in both arms, after which ſhe recovered, which ſo delighted the king, that he gave him his daughter in marriage, with the Cherſones as a portion. Here Podalirius built two cities, the one of which he called Syrnum, from his wife, Syrna, and the other Bybaſſus, which was the name of the ſhepherd who had received him when ſhipwrecked. Among other children, he had a ſon, called Hippolochus, from whom, in a direct line, Hippocrates conſidered himſelf as deſcended. See Le Clerc. Hiſt. de la Medecine, p. i. chap. 18. See MACHAON.

PODALYRIA, in *Botany*, a well-ſounding name, which ſeems its chief recommendation; for we do not perceive what title the brother of Machaon, however famous a phyſician, has to botanical honours. The etymology of the original ſeems to be ποδαλειριος, *lily-footed*. The Hindoos at this day uſe *lotus-footed* as a compliment.—Lamarck Illuſtr. t. 327. f. 3, 4. Willd. Sp. Pl. v. 2. 501. Ait. Hort. Kew. v. 3. 6.—Claſs and order, *Decandria Monogynia*. Nat. Ord. *Papilionaceæ*, Linn. *Leguminoſæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, ſhort, bell-ſhaped, in five unequal ſegments; its baſe externally concave. *Cor.* papilionaceous, of five petals. Standard twice as large as the reſt, kidney-ſhaped, with a thick claw. Wings two, ſhorter than the ſtandard, half-obovate, converging at their upper edges. Keel ſhorter than the wings, and covered by them, of two oblong converging petals. *Stam.* Filaments ten, awl-ſhaped, aſcending, equal, inſerted into the baſe of the calyx, permanent, cohering at the bottom; anthers roundiſh, ſmall. *Piſt.* Germen ſeſſile, ovate; ſtyle longer than the ſtamens, aſcending; ſtigma ſimple, obtuſe. *Peric.* Legume ovate, turgid, coriaceous, of one cell. *Seeds* ſeveral, kidney-ſhaped.

Eſſ. Ch. Calyx in five unequal ſegments; hollow externally at the baſe. Corolla papilionaceous; the ſtandard largeſt. Stamens permanent, combined at the baſe. Legume inflated, with many ſeeds.

This genus is limited by Mr. Saliſbury and Mr. Brown to the ſimple-leaved ſpecies of Lamarck and Willdenow, to which only the above characters apply. They are ſhrubs, natives of the Cape of Good Hope, with a very ſilky habit, and confounded by Linnæus and Thunberg under *Sophora*. The ternate-leaved ſpecies of Lamarck and Willdenow compoſe the *Baptiſia* of Ventenat, and Hort. Kew.; for thoſe with pinnate foliage, ſee VIRGILIA.

1. P. *myrtillifolia*. Bilberry-leaved Podalyria. Willd. n. 13. Ait. n. 1. (Geniſta arboreſcens africana, ſtyracis folio, flore cæruleo; Herm. Lugd.-Bat. 270. t. 271.)—"Leaves oblong-obovate, ſilky on both ſides. Calyx ſilky. Stalks ſingle-flowered, nearly as long as the leaves."—A greenhouſe plant, flowering from April to July, introduced at Kew in 1795, but cultivated at Leyden more than a century earlier. Hermann ſays it grows at the Cape, in watery places. The *ſtem* is buſhy, with hoary branches. *Leaves* numerous, alternate, coriaceous, rather pointed, clothed on both ſides with white ſilky down. *Flowers* axillary, generally ſolitary, blueiſh. The ſpecific name is not happy.

2. P. *ſericea*. Silky Podalyria. Ait. n. 2. (Sophora ſericea; Andr. Repoſ. t. 440.)—"Leaves oblong-obovate, ſilky on both ſides. Calyx ſilky. Stalks ſingle-flowered, many times ſhorter than the leaves."—Found at the Cape by Mr. David Nelſon, and introduced into Kew garden in 1778. It flowers from Auguſt to November, but rarely. This has more conſiderable recurved points to the *leaves*, and pale purpliſh *flowers*, ſupported by ſhort, ſimple, ſolitary, axillary *ſtalks*. The *legume* is an inch long, very ſilky, like every other part, except the *corolla*.

3. P. *biflora*. Two-flowered Podalyria. Lamarck f. 3. Willd. n. 12. Ait. n. 3. Curt. Mag. t. 753. (P. argentea; Saliſ. Parad. t. 7.)—Leaves oval, pointed, ſilky on both ſides. Calyx clothed with denſe rigid down. Stalks two-flowered, much longer than the leaves.—Native of the ſame country. Mr. Maſſon ſent it to Kew in 1789. It flowers in May and June, and occaſionally at other ſeaſons. The *leaves* are rather leſs decidedly obovate than in the two former. *Flower-ſtalks* ſtout, twice or thrice as long as the leaves, each bearing two, rarely three, large, handſome, ſweet-ſcented, white or pale purpliſh *flowers*, whoſe *calyx* is of a ruſty hue, rough with rigid ſhort down, that is moſt denſe in the wild ſpecimens. Linnæus doubtleſs comprehended this plant under his *Sophora biflora*, but he confounded with it two or three others, ſo that he cannot, with preciſion, be quoted for any.

4. P. *calyptrata*. Reticulated Podalyria. Willd. n. 11. Ait. n. 4. (Sophora calyptrata; Retz. Obſ. faſc. 1. 36. Crotalaria; Seb. Muſ. v. 2. t. 99. f. 3, good. *Willd.*)—Leaves ſomewhat obovate, reticulated beneath; downy when young. Stalks ſingle-flowered, about equal to the leaves. Calyx villous; its limb membranous, reflexed.—From the ſame country; ſent to Kew in 1792. It flowers during ſummer. The ſmoothneſs of the adult *leaves*, and their ſtrong copious reticulations beneath, mark this ſpecies at firſt ſight. The *ſtalks*, ſhorter than the laſt, bear but one *flower*, accompanied, as in the reſt, by a deciduous *bractea*. *Corolla* purpliſh.

5. P. *hirſuta*. Hairy Podalyria. Willd. n. 14. Ait n. 5. (P. ſtyracifolia; Sims in Curt. Mag. t. 1580?)—"Leaves villous, ſtalked; the upper ones ovate; the lower roundiſh. Stalks ſingle-flowered. Calyx villous; its ſegments the length of the wings."—Sent by Mr. Maſſon from the Cape, in 1774. The *flowers* are more copious than in any of the former, but not of frequent occurrence. *Leaves* in our wild ſpecimen nearly orbicular; the adult ones almoſt ſmooth above. *Flower-ſtalks* about the length of the leaves. *Corolla* pink, large and handſome. The foliage in the Botanical Magazine is drawn more ovate than we have ſeen it, but anſwers the better to Mr. Brown's ſpecific character given above, and we are therefore more inclined to refer Dr. Sims's plant to the preſent than to the laſt ſpecies. He ſpeaks of it as a beautiful ſhrub, requiring an airy greenhouſe, propagated by cuttings, and blooming from May to July. No wonder that it has paſſed unexamined, under the name of *biflora*, as it ſo rarely produces flowers. Linnæus applied that name to a ſpecimen of this, paſted with one of the *calyptrata*, on the ſame paper.

6. P. *buxifolia*. Box-leaved Podalyria. Willd. n. 15. (Podalyria; Lamarck f. 4. Sophora buxifolia; Retz. Obſ. faſc. 1. 35. S. pedunculata; Thunb. Prodr. 79.)—Leaves elliptic-obovate; ſmooth above; ſilky beneath. Stalks ſingle-flowered, longer than the leaves. Calyx downy, coloured, acute.—Native of the Cape, but not yet known in our greenhouſes. We have ſeen no ſpecimen. The *leaves* are repreſented about the ſize and ſhape of Box, ſcarcely half, or one-third, the length of the *flower-ſtalks*; but Retzius deſcribes the latter as no longer than the *leaves*. The *calyx* is hairy within, as well as without; its ſegments acute. *Corolla* purpliſh, with paler wings.

7. P. *cordata*. Heart-leaved Podalyria. Ait. n. 6. (Sophora

(Sophora cordata; Thunb. Prodr. 79? *Brown.*)—"Leaves heart-fhaped, roundifh, nearly feflile, extremely villous. Stalks two-flowered. Calyx villous, its fegments fhorter than the wings. Sent by Mr. Maffon from the Cape to Kew, in 1794. It flowers there from May to July. We have feen neither fpecimen nor figure. Willdenow omitted Thunberg's plant, becaufe the character was not fufficient to fatisfy him refpecting it.

Lamarck reprefents, at his fig. 5, another fuppofed fpecies; a fmall fhrub, with inverfely heart-fhaped *leaves*, and folitary, nearly feflile, *flowers;* the *legume* fmall, ovate, hairy, fingle-feeded. This feems unnoticed by any fubfequent writer, nor are we acquainted with the plant.

PODANA, in *Geography*, a town of Hindooftan, in the circar of Condapilly; eight miles from Mafulipatam.

PODANG-MEW, a large and populous city of the Birman empire, not far from the city of Prome.

PODARIA, in the *Hiftory of Infects*, a claffical name comprehending all fuch infects as have limbs, but no wings. Hill. See APTERA.

Of this clafs there are two fubdivifions. 1. Such *aptera podaria* as have oblong bodies with numerous legs, or more than fix pair: thefe are the julus, or gally-worm; the fcolopendra, or centipes; and the onifcus, or wood-loufe. 2. The *aptera podaria* with fhorter bodies, and lefs numerous legs, or fewer than fix pair. This fubdivifion contains numerous genera, as the pulex; the podura or puceron, the pediculi of various kinds, the monoculi, the acari, the aranei, the fcorpio, and a great many others. See GALLY-*Worm*, SCOLOPENDRA, &c.

PODEM, in *Geography*, a town of Afiatic Turkey, in the government of Trebizond; 30 miles E. of Trebizond.

PODEMNO, a town of Ruffia, in the government of Tobolfk; 44 miles E. of Kemfkoi.

PODENDA, a town of Afiatic Turkey, in Aladulia, at the confluence of Seihoun with the Adana; 33 miles N. of Adana.

PODENSEE, a town of France, in the department of the Gironde, and chief place of a canton, in the diftrict of Bourdeaux; five miles N.W. of Cadilhau. The place contains 1425, and the canton 15,688 inhabitants, on a territory of 250 kiliometres, in 13 communes.

PODENSEE, a town of Auftria; eight miles W. of Tulin.

PODENTES, a town of Portugal, in the province of Beira; 10 miles N.E. of Coimbra.

PODENZANA, a town of the duchy of Piacenza or Placentia; five miles S. of Piacenza.

PODERADOS, in *Ancient Geography*, an epifcopal town of Phœnicia, the epifcopate being dependent on Thefus, the fecond metropolis of the patriarchate of Antioch.

PODERIS, ποδηρης, from πους, *pes*, and αγω, *apto*, in *Antiquity*, a robe hanging down to the feet; but it is chiefly ufed to exprefs a linen garment, a furplice, a fhirt. The Jewifh priefts were covered with this kind of long furplices during the time of their attendance in the temple; and this was the proper habit of their order.

PODESTA, or POTESTA, a magiftrate, or officer of juftice and policy, in a free city.

The name is originally Italian, *podefta;* and is chiefly applied to certain magiftrates of Venice and Genoa, whofe function is to adminifter juftice in thofe republics.

The podefta in Venice correfponds to the prætor in ancient Rome, though appeals lie from his decifions to the new auditors, or the new civil quaranty. See QUARANTIA.

PODESTANA, in *Geography*, a town of Italy, in the Veronefe; 15 miles N. of Verona.

PODETIUM, in *Botany*, from πους, *a foot*, a name appropriated by Acharius to the peculiar footftalk of the tubercles in the cup lichens. See LICHENES.

PODEX, in *Anatomy*, &c. the fame with anus, or fundament.

PODGINOCK, in *Geography*, a town of Ruffia, in the province of Ufting; 100 miles E.S.E. of Uft Sifolfk.

PODGORODKOI, a fort of Ruffia, in the government of Upha, on the Ural; 92 miles E. of Orenburg.

PODGURZA, a town of the duchy of Warfaw, on the Viftula, oppofite to Thorn.

PODHORSAN, a town of Bohemia, in the circle of Saatz; eight miles S.S.W. of Saatz. N. lat. 50° 12'. E. long. 13° 29'.

PODICEPS, in *Ornithology*, a name given by many to the feveral kinds of *colymbi*, or divers, as they are alfo called in Englifh *arfe-foots;* from their legs being placed very backward on their bodies, by which means they have great advantages in fwimming and diving. See COLYMBUS *Podiceps*.

PODIEBRAD, in *Geography*, a town of Bohemia, in the circle of Konigingratz; 14 miles S.E. of Biezow.

PODISMUS, ποδισμος, among the Greeks, a certain fpace or number of feet laid out by furveyors: it was the fame with what the Romans call *pedatura*.

PODIUM, in the *Theatre of the Ancients*, the wall that feparated the orcheftra from the fcene. Mem. de l'Acad. vol. i. p. 190.

PODKAMIEN, in *Geography*, a town of Auftrian Poland, in Galicia; 56 miles E. of Lemberg.

PODKAMNEN, a town of Ruffia, in the government of Tobolfk, on the Tchulim; 32 miles N. of Atchinfk.

PODLACHIA, a county or palatinate of Poland; bounded on the N. by Pruffia and Lithuania, on the E. by Lithuania, on the S. by the palatinate of Lublin, and on the W. by Mafovia; annexed by the conqueft of Poland in 1596. It is alfo called the "Palatinate of Bielfk," from its capital.

PODMASCHESCHNAIA, a town of Ruffia, in the government of Archangel; 48 miles S.W. of Mezen.

PODOK, a town of Poland, in the palatinate of Braclaw; 30 miles N.W. of Braclaw.

PODOL, a town of Bohemia, in the circle of Chrudim; five miles W.S.W. of Chrudim.

PODOLEPIS, in *Botany*, aptly fo named by Labillardiere, from πους, *a foot*, and λεπις, *a fcale*, in allufion to the numerous fcales, which clothe the flower-ftalks.—Labill. Nov. Holl. v. 2. 56. Brown in Ait. Hort. Kew. v. 5. 82. (Scalia; Sims in Curt. Mag. v. 24. 956; a name adopted from Theophraftus, whofe σκαλιας appears to belong to the fame tribe.)—Clafs and order, *Syngenefia Polygamia-fuperflua*. Nat. Ord. *Compofitæ capitatæ*, Linn. *Corymbiferæ*, Juff.

Gen. Ch. *Common Calyx* hemifpherical, imbricated, with numerous ftalked membranous fcales. *Cor.* compound, radiated. Florets of the difk numerous, tubular, all perfect, with five equal fpreading fegments; thofe of the radius female, ligulate, with from two to four oblong fegments. *Stam.* Filaments, in the florets of the difk only, five, capillary; anthers united into a rather prominent tube. *Pift.* in all the florets, Germen inferior, obovate; ftyle cylindrical, fcarcely fo long as the ftamens; ftigmas two, bluntifh, fpreading. *Peric.* none, except the permanent calyx. *Seeds* folitary, oblong, compreffed. *Down* feflile, capillary, roughifh. *Recept.* naked, dotted.

Eff. Ch. Receptacle naked. Down fimple. Calyx hemifpherical, imbricated, with ftalked membranous fcales.

1. P. *rugata.* Wrinkle-fcaled Podolepis. Labill. Nov. Holl. v. 2. 57. t. 208. Ait. n. 1.—Scales of the calyx rugged, obtufe.—Native of the fouth-weft coaft of New Holland. Sent to Kew by Mr. Peter Good, in 1803. It requires the fhelter of a greenhoufe in winter, and flowers in July and Auguft. *Root* perennial. *Stem* herbaceous, either quite fimple, or a little branched at the top only, about a foot high, minutely downy. *Leaves* linear, acute, entire; the lower ones fomewhat lanceolate. *Flowers* few, on long, terminal, fimple, fcaly ftalks. Their *difk* is about an inch wide; the *radius* fhort. *Calyx* of a tawny or rufty hue, fhining, chaffy; the outermoft fcales fpatulate.

2. P. *acuminata.* Sharp-fcaled Podolepis. Ait. n. 2. (Scalia jaceoides; Curt. Mag. t. 956.)—Scales of the calyx even, fharp-pointed. Gathered in New South Wales by Mr. Brown, and fent to Kew by Colonel Paterfon, in 1803. It is a hardy greenhoufe plant, flowering all through the fummer, and differs from the former chiefly in having a larger *flower*, the *radius* being confiderably longer, as well as in the fharpnefs of the *calyx-fcales.* All the *florets* are of a golden yellow.

PODOLIA, in *Geography*, a province of Poland, bounded on the N. by Volhynia, on the E. by the palatinate of Kiev, on the S. by Moldavia, and on the W. by the palatinate of Lemberg, near the kingdom of Galicia. The country is fertile, but expofed to the plunder of barbarous nations, by which it has been cruelly ravaged. It abounds with a fine breed of horfes and horned cattle. The inhabitants are warlike, and were formerly governed by their own dukes or fovereigns. In the fifteenth century it was the object of violent contefts between the Lithuanians and Poles; but by the decree of a diet held at Lublin in 1569, it was annexed to Poland. Podolia confifts of two palatinates, that of Podolia and that of Braclaw; both of which are annexed to Ruffia, except a fmall part towards the W., including Tarnopol, and a few more towns.

PODOLICZ, a town of Hungary, on the river Poprat; 12 miles S.W. of Palotza.

PODOLOBIUM, in *Botany*, from πες, *a foot*, and λοβος, *a pod* or *legume*, becaufe that part is elevated on a footftalk. Brown in Ait. Hort. Kew. v. 3. 9. Sims in Curt. Mag. v. 36. 1477.—Clafs and order, *Decandria Monogynia.* Nat. Ord. *Papilionaceæ*, Linn. *Leguminofæ*, Juff.

This genus is comprehended under *Chorozema*, by the writer of the prefent article, in Tr. of the Linn. Soc. v. 9. 251, nor does he perceive a character by which they can well be feparated, though Dr. Sims and Mr. Brown have thought otherwife. The keel in *Podolobium* is rather longer than the wings; in *Chorozema* fhorter. The *leaves* are indeed oppofite in *P. trilobatum*, Curt. Mag. t. 1477, but this does not appear to be the cafe with every fpecies, nor is it very precifely or conftantly fo, even with the plant in queftion.

PODOLSK, in *Geography*, a town of Ruffia, in the government of Mofcow; 28 miles S. of Mofcow. N. lat. 53° 16′. E. long. 37° 29′.

PODOLYB, a town of Bohemia, in the circle of Konigingratz; 12 miles W.N.W. of Konigingratz.

PODOMETER, for PEDOMETER. See PEDOMETER.

PODONIPTÆ, formed from πες, ποδος, *foot*, and νιπτω, *I wafh*, in *Ecclefiaftical Hiftory*, a name given to fome of the rigid Anabaptifts, who enjoin it as an obligation upon the members of their community to wafh one another's feet, in compliance with the example of Chrift.

PODOPERURA, in *Ancient Geography*, a town of India, on this fide of the Ganges, in the country of the people called Limyrices. Ptolemy.

PODOPHYLLUM, in *Botany*, from πες, *a foot*, and φυλλον, *a leaf.* Tournefort originally called it *Anapodophyllon*, from *anas*, the Latin name for a duck; thus compofing a hybrid word, unworthy of his tafte and fcholarfhip. De Theis erroneoufly lays the blame on Catefby. The idea of this appellation arofe from a vague refemblance in the leaves, to the webbed feet of many aquatic birds, which is fufficiently intelligible in the word as Linnæus has pruned it.—Linn. Gen. 262. Schreb. 349. Willd. Sp. Pl. v. 2. 1141. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 3. 287. Purfh. v. 2. 366. Juff. 235. Lamarck Illuftr. t. 449. (Anapodophyllon; Tourn. t. 122.)—Clafs and order, *Polyandria Monogynia.* Nat. Ord. *Rhoeadeæ*, Linn. *Ranunculaceæ*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of three large, coloured, ovate, concave, afcending leaves, foon falling. *Cor.* Petals nine, orbicular, concave, plaited at the margin. *Stam.* Filaments numerous, very fhort; anthers oblong, large, erect. *Pift.* Germen fuperior, roundifh; ftyle none; ftigma obtufe, furrowed. *Peric.* Berry globofe, crowned with the permanent ftigma, of one cell. *Seeds* numerous, roundifh. *Receptacle* central, unconnected.

Eff. Ch. Corolla of nine petals. Calyx of three leaves, deciduous. Berry of one cell, crowned with the ftigma.

1. P. *peltatum.* Duck's-foot, or May-apple. Linn. Sp. Pl. 723. Willd. n. 1. Ait. n. 1. Trew Ehret, t. 29. (Anapodophyllum canadenfe; Catefb. Car. v. 1. t. 24. Aconitifolia humilis, flore albo unico campanulato, fructu cynofbati; Mentz. Pugill. t. 11.)—Native of North America, from New England to Carolina, in fhady woods, generally where the ground is moift, growing in large patches, and flowering in March and April. The fruit is the fize of a common plum, green, eatable, known by the name of May-apple: the root is fometimes ufed as Ipecacuanha. *Purfh.* This is a hardy perennial herbaceous plant, known time out of mind in our more curious gardens. The *root* creeps, and refembles that of the *Helleborus niger.* *Stems* folitary, fimple, round, fmooth, about a foot high, crowned with two large, ftalked, peltate, lobed, and jagged, fmooth *leaves*, between whofe *footftalks* grows a folitary, ftalked, drooping white *flower*, an inch and a half broad, whofe *petals* are curioufly reticulated with veins.

The other fpecies of Linnæus, *P. diphyllum*, Sp. Pl. 723, is feparated from this genus by Barton, Michaux, and Purfh, and is thus diftinguifhed.

Calyx of five leaves, deciduous. Petals eight, incurved. Capfule obovate, fomewhat ftalked, of one cell, burfting below the fummit. Seeds feveral, oblong, tunicated at the bafe.—This has received the name of *Jefferfonia diphylla.* It belongs to *Octandria Monogynia*, and appears to us a tolerably diftinct genus, though retained in *Podophyllum* by Willdenow, and confequently in Hort. Kew. See Purfh v. 1. 268.

PODOR, in *Geography*, a fortrefs of Africa, on the Senegal, built by the French, and ceded to the Englifh in 1763; afterwards retaken by the French, and kept by them in the peace of 1783. N. lat. 17° 1′. W. long. 14° 20′.

PODOSTEMUM, in *Botany*, derived from πους, *a foot*, and στημων, *a ftamen*; fo named by Michaux on account of the ftamens being fituated on a bafe or foot, which is divided into two branches.—Michaux Boreal-Amer. v. 2. 164. Willd. Sp. Pl. v. 4. 196. Purfh. v. 1. 3.—Clafs and order, *Monoecia Diandria.* Nat. Ord. . . . . . .

Gen. Ch. Male, *Cal.* Perianth none. *Cor.* none. *Stam.* Filaments two, capillary, connected at the bafe by a common footftalk; anthers fomewhat heart-fhaped, two-celled.

Female, *Cal.* Perianth none. *Cor.* none. *Pist.* Germen feffile, ovate, with two fcales at the bafe, between which fprings the foot of the ftamens; ftyle none; ftigmas two, feffile, fomewhat thread-fhaped, a little fhorter than the germen, fpreading. *Peric.* Capfule ovate, eight-ftreaked, with two cells and two valves; partition parallel to the valves, flightly opening, not fixed. *Seeds* numerous, almoft covering each fide of the tumid partition, fomewhat imbricated downwards, nearly oval.

Eff. Ch. Male, Calyx none. Corolla none. Stamens two, on a common ftalk.—Female, Calyx none. Corolla none. Germen ovate. Stigmas two, feffile. Capfule of two cells and two valves, many-feeded.

1. P. *Ceratophyllum.* Michaux t. 44. Willd. n. 1.—Native of rocks about the falls of the river Ohio.—*Stem* a finger's length, thread-fhaped, floating. *Leaves* pinnate, alternate; leaflets alternate, briftle-fhaped, much cloven. *Flowers* axillary, folitary, the males inferted at the bafe of the females.

We are unable to trace any affinity to this curious genus. It has certainly no relation to *Ruppia* as Michaux has fuggefted. Mr. Purfh places it in *Monandria Digynia.*

PODRELSKOI, in *Geography*, a town of Ruffia, in the government of Viatka; 32 miles N.N.E. of Viatka.

PODRUS, a river of Walachia, which runs into the Syl, about three miles E. of Motril.

PODSPUSKNOI, a fort of Ruffia, in the government of Kolivan; 220 miles S.W. of Kolivan. N. lat. 51° 20'. E. long. 78° 34'.

PODSTEPNOI, a fort of Ruffia, in the government of Kolivan; 196 miles S.W. of Kolivan. N. lat. 52° 10'. E. long. 77° 40'.

PODULLUNG, a town of European Turkey, in Moldavia; 28 miles S.W. of Jaffi.

PODURA, the *Spring-tail,* in *Entomology*, a genus of infects of the order Aptera. The generic character is, lip bifid; feelers four, fubclavate; two eyes, compofed of eight facets; the antennæ are filiform; the body is fcaly; tail forked, bent under the body and acting as a fpring; it has fix legs that are formed for running. There are about thirty fpecies enumerated by Gmelin. They are all fmall infects, which, in general, are found in damp places, under ftones, on the bark of trees, &c. When difturbed they fuddenly fpring to a fmall diftance by the help of a long fork, which is doubled under the abdomen, and which is fuddenly thrown out during the act of leaping. They feed on the leaves of various plants; the larva and pupa are fix-footed, nimble, and refemble the perfect infect.

Signata. Sub-globular, brown; abdomen with fulvous fpots at the fides.

* Viridis. Sub-globular, green, with a yellowifh head. Found on the leaves of the Polygonum fagopyrum.

* Polypoda. Sub-globular, black; antennæ as long as the body, and tipt with white. Found on various plants, in this and other countries of Europe.

* Atra. Globular, fhining brown or black; antennæ long, compofed of many articulations. It is found on the bark of trees.

* Plumbea. Round, brown, with a blue glofs. It is found in fimilar fituations with the laft.

* Minuta. Ovate, yellow, with two ferruginous fpots on the back. This and the four following are found on plants in many parts of Europe.

* Nivalis. Oblong, yellow, with two ferruginous fpots on the back. It is frequently found in the winter on the fnow in the footfteps of men and other animals.

* Vaga. Oblong, black; abdomen and antennæ with a white band.

* Arborea. Oblong, black, with white legs and forks.

* Villosa. Oblong, villous, variegated with brown and black.

Cineta. Cylindrical, grey, with a black belt, which is white on the fore-part. This and the next are found chiefly in woods.

Annulata. Livid, with black wings.

Lignorum. Lead-colour, with pale head, thorax, legs, and fork. This is an European infect, very fmall, and found in old wood.

Pusilla. Cylindrical, bronzed with a white fork. It inhabits woods.

* Aquatica. Black, aquatic. This is one of the moft common fpecies of the genus, meafuring fcarcely the one-twelfth of an inch in length, and entirely of a black colour. It is a gregarious fpecies, and is occafionally feen affembled in vaft numbers, particularly near the brinks of ponds, covering the ground to the diftance of feveral feet, and fometimes even the furface of the water itfelf. On the ground its numbers are fo great, as to have the appearance of fcattered grains of gunpowder; and if clofely examined, will be found in an almoft perpetual fkipping motion.

* Fimetaria. White, terreftrial. This perfectly refembles the laft except in colour, and in that the fpecific difference confifts. It is found early in the fpring in frefh earth, and alfo in damp places.

Ambulans. White, with a bifid extended tail. Found among mofs in different parts of Europe.

Monura. Whitifh, with an undivided conic tail. It inhabits Auftria, and found with the laft, which it refembles, but is much lefs.

* Rufescens. Reddifh-yellow, villous; eyes black; fork whitifh. A native of Auftria, and found among ftones.

Viridis. Sub-cylindrical, yellow-green, with black eyes. This is found in Norway.

Motitans. Long, red, with an extended tail; antennæ and legs hyaline. This and the eight that follow inhabit Denmark.

Sylvatica. Cylindrical, grey-brown; tail pointed and unarmed.

Femoralis. Oblong, cinereous; tip of the antennæ and legs white; tail of a fulphur colour.

Aquatilis. Cylindrical, yellowifh, with black eyes, back, and fides of the abdomen.

Crystallina. Body entirely hyaline.

Longicornis. Cylindrical, yellowifh; antennæ as long as the body, and with legs cinereous.

Palustris. Yellowifh, with black eyes and line down the back; the fork is white.

Lanuginosa. Silvery-gilt covered above with blue wool; antennæ recurved.

Crassicornis. Dull blue, cylindrical and growing thicker towards the tail.

Humicola. Blue-brown; antennæ fhort, thick; body cylindrical, and growing thicker towards the tail. Inhabits Greenland, as does the next.

Maritima. Blueifh-black, with a whitifh abdomen; body nearly round, and growing thicker towards the tail.

Podura is alfo a fpecies of *Cercaria,* in the clafs of *Vermes Infuforia.*

PODURUEVA, in *Geography*, a town of Ruffia, in the government of Irkutfk, on the Lena; 12 miles N.N.W. of Vercholenfk.

POE, a river of the county of Tyrone, Ireland, which rises in the south-western part, and joins the Camerm a little below Omagh.—Also, a town of Africa, in Biol; five miles S. of Portudel.

PŒANOPSIA, ποανοψια, in *Antiquity*, a name sometimes given to the festival Pyanepsia.

PŒCILASIUM, in *Ancient Geography*, a town situated on the southern coast of the isle of Crete. Ptolemy.

PŒDICULI, or PŒDICLI, the name of one of the three people who composed the nation of the Liburni. They came originally from Illyria, about the 16th century B.C.; settling at first between the Alps and the Athesis, when they retired towards the south of Italy into Japygia. The Pœdiculi, Apuli, and Calabri spoke the same language, which they retained. Strabo.

POEJANNY, in *Geography*, a town of Bengal; seven miles S. of Koonda.

POEL, an island in the Baltic, near the coast of Pomerania, irregular in its figure, and about six or seven miles in circumference, containing several villages; two miles N. of Wismar. N. lat. 53° 57′. E. long. 11° 26′.

POELEMBURG, CORNELIUS, in *Biography*, was born at Utrecht in 1586, where he became the disciple of Abraham Bloemart; but he quitted that master as soon as he had made a reasonable proficiency in the art, and travelled to Rome. His first determination was to imitate the manner of Elsheimer; but he found himself so affected while he contemplated the works of Raphael, that he resolved on endeavouring to emulate the grace of that incomparable master; particularly in the naked.

He formed for himself a style that was entirely new, and in many respects preferable to the Flemish gusto; but it did not resemble the style of any Italian master, except in the ruins of the antique buildings, with which he adorned his landscapes; and which he had with great care copied after nature. He surpassed all his contemporaries in the delicacy of his touch, in the sweetness of his colouring, and in the choice of agreeable objects and situations. His skies are clear, light, and transparent; his back-grounds, ornamented often with the vestiges of magnificent Roman edifices, which always contribute to the harmony of the whole composition; and his female figures, which he generally represented naked, are beautiful and elegant forms. His greatest excellence appeared in the small pictures of his hand, for in the larger size he is not so deserving of commendation.

The Italians were excessively pleased with the works of Poelemburg; and some of the cardinals at Rome, of the finest taste, attended him frequently while he was painting, to observe his manner of working, and expressed their admiration in the strongest terms.

It was not without regret that he left Rome to return to his own country; though he afterwards found sufficient cause to be pleased with the honours he received from the grand duke of Florence, and the respect shewn to him in every city through which he travelled, as well as in his native city Utrecht. For, not long after his arrival, Rubens paid him a friendly visit, and having expressed a singular pleasure in examining the works of Poelemburg, he purchased several for his own cabinet, and bespoke others; by which generous conduct, so similar to that of Apelles towards Protogenes of Rhodes, he instructed the lovers of the art to estimate the merit of Poelemburg as highly as they ought; and at the same time advanced the fortune and the reputation of that artist.

By king Charles I. he was invited to the court of London; where he painted many curious pictures, for which he was nobly recompensed; and that monarch endeavoured earnestly to induce him to continue in England; but his fondness for his own country prevailed over all other considerations, and he returned to Utecht, where he acquired an affluent fortune, and lived in universal esteem. Several very eminent artists procured him to paint the figures in their works, particularly Steenwyck and Kierings; and the excellent perspectives of the former are sometimes rendered still more estimable by the pencil of Poelemburg.

The genuine work of this master are exceeding scarce; but his disciple, John Vander Lis, imitated his manner so successfully, that the paintings of Lis are very often taken for the works of his master. Fuseli's Pilkington.

POELSBROICK, in *Geography*, a town of Holland; seven miles S.E. of Gouda.

POEM, POEMA, ποιημα, a composition in verse, of a due length and measure.

POEMS, *Carmina*, are of various kinds; some denominated from the persons who first invented, or most used them; as the *Archilotian*, *Sapphic*, &c. Others from their composition, as the *monocolon*, consisting of one kind of verse; *dicolon*, of two; and *tricolon*, of three kinds. Others from their entireness or deficiency; as *brachycatalectus*, which in every verse wants two syllables; *catalectus*, which wants one; *acatalectus*, none; and *hypercatalectus*, which hath a syllable too much, which, if cut off at the beginning of the next verse, the verse is said to be *hypermeter*. (See ACATALECTIC, &c.) Others are denominated from the subject matter; as the *apobaterion*, *epibaterion*, *epinicion*, *epithalamium*, *genethliac*, *propemptic*, *elegiac*, *satiric*, *epicedion*, *epitaph*, *threnos* or *lamentation*, *encomiastic*, *panegyric*, *soteric*, *lyric*, *pastoral*, &c. Others from the manner of narration; as *exegetic*, which relates a thing under the author's own person, *dramatic*, and *epic*. See each on its proper head, EPIC, DRAMA, &c. To these may be added, odes, eclogues, and idylliums.

To this head must also be referred several other poetical compositions of a less serious kind, which the idly-labouring vein of little poets has produced into the world, and which, though frequently admired by persons of a low taste, are justly ranked by Mr. Addison in the class of false wit. Such are the acrostic, enigma, anagram, centochronogram, proteus, echo, &c.

PŒNITENTES, in the church of Rome, a designation given to heretics, who being admonished by the ecclesiastical judge, have abjured their errors, and given sufficient satisfaction to the bishop or inquisition. Confiscation of goods is a punishment common to all heretics; but if they confess and abjure of their own accord, without being formally prosecuted, this part of their punishment is usually remitted. See INQUISITION.

POEROU, in *Natural History*, a name given at Otaheite in the South-seas to the hibiscus tiliaceus of Linnæus, of the bark of which they make matting, coarse cloth, and ropes and lines from the thickness of an inch to the size of a small packthread. Hawkesworth's Voyages, vol. ii. p. 217.

PŒSTUM, in *Ancient Geography*, called also *Posidonia*, a city of Italy, on a gulf of the same name, at some distance to the S. of the mouth of Silarus. Obscurity hangs over, not only the origin, but the general history of this city, though it has left such magnificent monuments of its existence. According to the learned Mazzochi, Pœstum was founded by a colony of Dorians, from Dora, a city of Phœnicia. It was first called Pœstan, or Postan, which in the Phœnician language signifies Neptune, to whom it was dedicated. It was afterwards invaded, and its primitive inhabitants expelled by the Sybarites, which event is supposed

posed to have taken place about 500 years B.C. Under its new masters Pœstum assumed the Greek appellation "Posidonia," of the same import as its Phœnician name, became a place of great opulence and magnitude, and is supposed to have extended from the present ruins southward to the hill, on which stands the little town still called, from its ancient destination, "Acropoli." The Lucanians afterwards expelled the Sybarites, and checked the prosperity of Posidonia, which was in its turn deserted, and left to moulder away imperceptibly. Vestiges of it are still visible all over the plain of Spinazzo or Saracino: the original city then recovered its first name, and not long after was taken, and at length colonized by the Romans, U.C. 480. From this period Pœstum is mentioned almost solely by the poets, who, from Virgil to Claudian, seem all to expatiate with delight amidst its gardens, and grace their composition with the bloom, the sweetness, and the fertility of its roses. But unfortunately the flowery retreats, "Victuria rosaria Pœsti," seem to have had few charms in the eyes of the Saracens, and, if possible, still fewer in those of the Normans, who, each in their turn, plundered Pœstum, and at length compelled its few remaining inhabitants to abandon their ancient seat, and take shelter in the mountains. To them "Capaccio Vecchio" and "Novo" are supposed to owe their origin: both these towns are situated on the hills: the latter is the residence of the bishop and chapter of Pœstum.

The edifices which still subsist owe their origin, as it is most reasonably supposed, to the Dorians; and their form seems to indicate that they are the oldest specimens of Grecian architecture now in existence. In fact, the temples of Pœstum, Agrigentum, and Athens, appear to be instances of the commencement, the improvement, and the perfection of the Doric order. The first temple that presents itself to the traveller from Naples is the smallest: it consists of six pillars at each end, and thirteen at each side, counting the angular pillars in both directions. The architrave is entire, as are also considerable remains of the pediments at the W. and E. ends. The "cella" occupied more than one-third of the length, and had a portico of two rows of columns, the shafts and capitals of which, now overgrown with grass and weeds, encumber the pavement, and almost fill the whole area of the temple. The second temple has six columns at each end, and fourteen on each side, including those of the angles: the whole entablature and pediments are entire. The "cella," the interior of which is adorned by a double row of columns, supporting each another row of small pillars, had two entrances, one at each end, with a portico formed of two pillars and two antæ. The whole of the foundation and part of the wall of this "cella" still remain: under it was a vault. The third edifice is the largest: it has nine pillars at the ends, and eighteen on the sides, including, as before, the angular columns. A row of pillars, extending from the middle pillar at one end to the middle pillar at the other, divides it into two equal parts, and is considered as a proof that it was not a temple. Some suppose it to have been a curia, others a basilica, and others a mere market or exchange. In common to all these edifices it may be observed, that they are raised upon substructions, visible in all the Doric temples of Italy and Sicily, forming three gradations, intended solely to give due elevation and relievo to the superstructure; that the columns in all rise without bases from the uppermost of these degrees; that these columns are all fluted between four and five diameters in height, and taper as they ascend, about one-fourth; that the capitals are all very flat and prominent; that the intercolumniation is a little more than one diameter; that the order and ornaments are in all the same, and the pediment in all very low: in fine, that they are all built of a porous stone, of a light or rather yellow grey, and in many places perforated and worn away. In the open place between the first and second temple were two other large edifices, built of the same sort of stone, and nearly of the same size. All the temples stand in a line, and border a street that ran from gate to gate, and divided the town into two, nearly equal, parts. A hollow space scooped out in a semicircular form seems to be the traces of a theatre, which lying in front of the temples gives reason for supposing that other public buildings might have ornamented the same side and made it to correspond in grandeur with that opposite; in which case few cities could have surpassed Pœstum in splendid appearance.

The walls of the town remain in all the circumferences, five at least, and in some places twelve feet high; they are formed of solid blocks of stone, with towers at intervals: the archway of one gate only stands entire. This rampart encloses a space of nearly four miles in circuit; and its extent, with the many towers that rose at intervals, and its elevation of more than forty feet, shew it to have been a work of great strength and magnificence.

Within these walls that once encircled a populous and splendid city, now rise one cottage, two farm-houses, a villa, and a church. The remaining space is covered with thick matted grass, overgrown with brambles spreading over the ruins, or buried under yellow undulating corn. A few rose bushes, the remnants of the "biferi rosaria Pœsti," flourish neglected here and there, and still blossom twice a year in May and December, as if to support their ancient fame, and justify the descriptions of the poets. Virgil and Ovid just mention the Pœstan roses: Propertius introduces them as an instance of mortality: Claudian employs them to grace a complimentary comparison: Ausonius alone presents them in all their beauty and sweetness.

> "Vidi Pœstano gauderi rosaria cultu
> Exoriente novo roscida Lucifero."
>
> Idyll. xxv.

Amid these objects and scenes, rural and ordinary, rise the three temples, like the mausoleums of the ruined city, dark, silent, and majestic.

Pœstum stands on a fertile plain, bounded on the W. by the Tyrrhene sea; about a mile distant on the S. by five hills, in the midst of which Acropoli sits embosomed; on the N. by the bay of Salerno and its rugged border; while to the E. the country swells into two mountains, which still retain their ancient names "Callimara" and "Cantena," and behind them towers "Mount Alburnus" with its pointed summits. A stream called the "Solofone" flows under the walls, and by spreading its waters over its low borders, and thus producing pools that corrupt in hot weather, continues, as in ancient times (see Strabo, lib. v.) to infect the air, and render Pœstum a dangerous residence in summer.

Mr. Watkins has given accurate and minute delineations and measurements of these celebrated temples; and he, as well as other travellers, supposes, that the pillars of Pœstum were covered with a sort of plaster, or stucco, which, by its long duration, seems to have acquired the hardness and consistency, as it certainly has the appearance, of stone. Near Pœstum there are four mineral springs, to which is ascribed considerable efficacy in different complaints: from these springs flow as many streamlets, that form the "fiume salso" which falls into the Solofone close to the walls of of the city. Beyond the ruins, and feparated from them by a little ftream, now called "Paltena," rifes the hill of the Acropoli, which merits the examination of the naturalift. As the plains that extend for fome way on each fide of the Silarus are very thinly inhabited, and at the fame time covered with woods and thickets, they are become the refort of banditti and outlaws. At the mouth of the Silarus is the fcite of the temple of Juno Argiva, of high antiquity, and attributed even to Jafon. Euftace's Claffical Tour through Italy, vol. ii.

POESY, Poesis. See Poetry.

The word is formed from the Greek ποιησις, of ποιεω, *facio, fabricor, fingo, I make, I frame, I invent.*

Hence alchemy, or the art of making gold, we anciently called *poefy, chryfopoefy, &c.*

POET, Poeta, an author who compofes poems or difcourfes in verfe.

Cicero relates it as a faying of Democritus and Plato, that there could be no good poet *fine afflatu furoris, without a tincture of madnefs;* and Ariftotle calls poets exprefsly, *maniaci, maniacs, madmen.*

M. Spanheim tells us that the Arab authors are more poetically given than thofe of any other people; and adds that there are more verfes among the Arabians than among all the other nations of the world put together.

The Greek word ποιητης, *poet*, fignifies *maker*, from ποιεω, *facio, I make;* whence the poets were anciently alfo called *fatifts*. The name they were properly denoted by among the Romans, was *vates*, which fignifies alfo *prophet*.

By a law of the emperor Philip, inferted in the Code, lib. x. tom. lii. poets are exprefsly excluded from the immunities granted the profeffors of all other fciences.

Homer, Virgil, Milton, and Taffo, are the chief, almoft the only, epic poets. Sophocles, Euripides, Shakfpeare, Otway, Corneille, and Racine, are the beft tragic poets. Ariftophanes, Menander, Plautus, Terence, Fletcher, Johnfon, Moliere, &c. the chief comic poets. Horace, Cowley, Malherbe, and Rouffeau, excelled as lyric poets. And Juvenal, Perfius, Regnier, Boileau, Dryden, and Oldham, as fatiric poets.

Poet *Laureat*. See Laureat.

This title, fays Mr. Gibbon, is perpetuated by cuftom, rather than vanity, in the Englifh court; and he adds, "from Auguftus to Louis, the mufe has too often been falfe and venal; but I much doubt whether any age or court can produce a fimilar eftablifhment of a ftipendiary poet, who, in every reign, and at all events, is bound to furnifh, twice a year, a meafure of praife and verfe, fuch as may be fung in the chapel, and, I believe, in the prefence of the fovereign. I fpeak the more freely, as the beft time for abolifhing this ridiculous cuftom, is while the prince is a man of virtue, and the poet a man of genius." Decl. and Fall of the Rom. Emp. vol. xii. 8vo. 1790.

Poet, *Provençal*. See Provençal, and Troubadours.

Poet's *Cæfia*, or *Poet's Rofemary*, in *Botany*. See Osyris.

POETICAL, ποιητικος, fomething that relates to poetry or poets. In this fenfe we fay, a poetical genius, a poetical phrafe, poetical licence, poetical fury, &c.

Poetical *Epiftle*. See Epistle, *Poetical*.

Poetical *Juftice*, is chiefly ufed in refpect to the drama, to denote a diftribution of rewards and punifhments to the feveral perfons, at the cataftrophe or clofe of the piece, anfwerable to the feveral characters in which they have appeared. See Character.

Whatever difficulties and diftreffes the virtuous and innocent may labour under, and how profperoufly foever it may go with the wicked, in the courfe of the piece; the poet ufually takes care to give each of them their due before he parts with them. But it is controverted whether this piece of juftice be indifpenfable, and whether it may not be allowed to leave virtue oppreffed, and vice flourifhing.

Poetical *Language*, is that language or ftyle, which acquires a peculiar elevation and ardour from the fentiments of a mind, fuppofed to be animated by fome interefting object that fires the imagination and engages the paffions of the poet; and this language is very different from that mode of expreffion which is natural to the mind in its calm ordinary ftate. This language of paffion or imagination is formed, *moft commonly*, into regular numbers; becaufe, though verfification be, in general, the exterior diftinction of poetry, yet there are fome forms of verfe fo loofe and familiar, as to be hardly diftinguifhable from profe, fuch as the verfe of Terence's comedies; and there is alfo a fpecies of profe, fo meafured in its cadence, and fo much raifed in its tone, as to approach very near to poetical numbers, fuch as the Telemachus of Fenelon, and the Englifh tranflation of Offian. The origin and firft ufe of poetical language, fays Dr. Lowth, are undoubtedly to be traced into the vehement affections of the mind. For what is meant by that fingular frenfy of poets, which the Greeks, afcribing to divine infpiration, diftinguifhed by the appellation of *enthufiafm*, but a ftyle and expreffion directly prompted by nature itfelf, and exhibiting the true and exprefs image of a mind violently agitated? Hence proceed fudden exclamations, frequent interrogations, apoftrophes, even to inanimate objects; for, to thofe who are violently agitated themfelves, the univerfal nature of things feems under a neceffity of being affected with fimilar emotions. Every impulfe of the mind has not only a peculiar ftyle and expreffion, but a certain tone of voice, and a certain gefture of the body adapted to it. Some, indeed, not fatisfied with that expreffion which language affords, have added to it dancing and fong; and as we know there exifted in the firft ages a very ftrict connection between thefe arts and that of poetry, we may poffibly be indebted to them for the accurately admeafured verfes and feet, to the end that the modulation of the language might accord with the mufic of the voice, and the motion of the body.

Moft languages have their poetical words, which are feldom, if ever, ufed on other occafions. Thefe words are of great ufe to the poets, who are thus enabled to raife their ftyle and diction to the poetical character with the greater eafe. The French lament the want of fuch appropriate words in their language; from a defect of which the ftyle of their poetry is not fufficiently diftinguifhed from the common language. It is too referved, not being allowed any boldnefs or flights, but fuch as might pafs in profe. To this circumftance is attributed, in a confiderable degree, the little fuccefs which their authors have met with in epic compofitions. Phrafes alfo, as well as words, which might originally have been in common ufe, are now reftricted to poetical compofitions. The language of Homer differs materially in the mode of inflexion, the fyntax, and even the words, from that which was written and fpoken in Greece in the days of Socrates; after an interval of 400 years. Homer, however, muft have written in a dialect that was intelligible, though not perhaps in familiar ufe at the period in which he wrote. Notwithftanding the change that muft have taken place, during fo long an interval, in the ftyle both of difcourfe and writing, the Iliad continued to be the ftandard of heroic poetry, and was confidered as affording a fpecimen of the moft perfect poetical language; though Ariftotle

Ariſtotle had doubts about the correct meaning of particular expreſſions. If Chaucer had ranked ſo highly as a poet as Homer did, and the Engliſh language under Edward III. had been as perfect as the Greek was in the ſecond century after the Trojan war, his ſtyle would probably have been the model of poetical language at this day; as Petrarch, his contemporary, ſets even now the ſtandard for the beſt Italian poets. Many words and phraſes, uſed by Ennius, a Latin poet, but not adopted by any proſe writer now extant, are to be found in Lucretius and Virgil, and by them tranſmitted to ſucceeding poets. Theſe form part of the Roman poetical dialect, which, as the writings of Virgil, where it is found in perfection, teſtify, was very copious. The ſtyle of this charming poet is ſo different from proſe, and ſo peculiar, that it cannot be analyſed on the common principles of Latin grammar; and yet no author can be more perſpicuous or more expreſſive; or knew better, according to the judgment of Quintilian, to improve even Greciſm, and old words by which he ſeems to be attached, into decoration.

The poetical dialect of modern Italy is ſo different from the proſaic, that Petrarch or Taſſo can ſcarcely be conſtrued by thoſe who are well acquainted with the common language of that country; and yet it is not probable that Petrarch, whoſe works furniſh a ſtandard of the Italian poetical diction, made any material innovations in his native tongue. The French poetry, in general, is diſtinguiſhed from proſe rather by the rhime and the meaſure, than by any old or uncommon phraſeology. Nevertheleſs, the French, on certain ſubjects, imitate the ſtyle of their old poets, particularly of Marot, and may therefore be ſaid to have a poetical dialect, though leſs extenſive than that of the Italian, or even of the Engliſh. The Engliſh poetical dialect is not characteriſed by any peculiarities of inflection, nor by any great latitude in the uſe of foreign idioms. Words and phraſes, however, occur in Engliſh poetry that are not to be found in proſe writings. Several of them will occur to the readers of our poets. The introduction of ſuch words and phraſes ſerves to render the poetical ſtyle more melodious; and when they are known to be ancient, more ſolemn, and by aſſociation more elegant and ſublime. The following lines afford a ſpecimen of poetical words, which no one can read without perceiving their effect:

"The breezy call of incenſe-breathing morn,
The ſwallow twittering from the ſtraw-built ſhed,
The cock's ſhrill clarion, and the echoing horn,
No more ſhall rouſe them from their lowly bed."

We may add, that tropes and figures ſerve very much to improve poetical language. They render it more pleaſing, and greatly contribute to its effect. They ſupply the unavoidable defects of common language; they are alſo favourable to delicacy of expreſſion; they promote brevity, which, without interfering with perſpicuity, is very pleaſing; they give ſtrength and energy to language, and make a deep and durable impreſſion on the mind; they are the appropriate language of emotion and paſſion. See FIGURE and TROPE, and each figure under its proper name, as *Apoſtrophe*, *Hyperbole*, and *Proſopopeia*; which ſee. The ſound of words ought alſo to be regarded in poetical language; as it contributes to harmony of compoſition, without which no poet can be popular. See VERSE and RHYME.

POETICAL *Licence*. See LICENCE.

POETICAL *Numbers*. See NUMBERS.

POETICAL *Riſing and Setting*. See RISING and SETTING. The ancient poets, referring the riſing, &c. of the ſtars to that of the ſun, make three kinds of riſing and ſetting, *viz.* coſmical, acronical, and heliacal.

POETICAL *Theology*. See THEOLOGY.

POETICS, POETICE, ποιητικη, the doctrine of poetry, or the laws and rules of conducting pieces, or compoſitions of poetry. Ariſtotle's Poetics is a work very highly valued; and M. Dacier's comment upon it is one of his beſt pieces. Horace, Vieta, Voſſius, and Scaliger, have likewiſe publiſhed Poetics in Latin; the duke of Buckingham in Engliſh; and Menardiere, Hedelin, and Deſpreaux, in French.

END OF VOL. XXVII.

Strahan and Preſton,
New-Street Square, London.
